barium cyanamide. This, however, is not the case, for the cold product contains a considerable quantity of barium cyanamide, and the inventors believe that this is due to the carbon, which separates out from the barium cyanide at high temperatures, separating in, or being subsequently converted into, a form (for instance the form of graphite) unsuitable for being taken up again by the barium cyanamide during cooling. They have, however, discovered that if, during cooling, a gas containing carbon (such for instance as acetylene, or generator gas which has been freed from carbon dioxide) be led over a mixture containing barium cyanamide, the barium cyanamide takes up carbon and is converted into barium cyanide. Carbon dioxide is not suited for use in carrying out the process of this invention. The reaction can also be carried out by heating a mixture containing barium cyanamide up to, and maintaining it at, a comparatively low temperature, while passing the gases containing carbon over the said mixture. Temperatures below 1200° Centigrade are suitable for use in carrying out the process of this invention.

Improvements in the Production of Radio-active Crystals. J. Reitz, Elster, Saxony. British Patent, 24,222. October 30, 1906.

Difficulties have arisen, in the application of radio-therapeutics, in preventing the radio-active substance from losing its radio-activity or emanation, or in producing a durable preparation of a constant constituent of the radio-active medium. Attempts have been made to overcome this defect by binding the emanation in an organic and not in a mechanical manner. It is known that the emanation of radium is restrained mechanically by shutting off the air or in a vacuum, in order to prevent a diffusion and the formation of helium. According to my new process the emanation emitted from the radium is caused to be taken up by water. The latter containing the emanation is combined with suitable substances in the form of water of crystallisation, or is conveniently enclosed by the latter substances. With this object in view water binding crystals are pulverised and deprived of their water of crystallisation by heat. The substance thus freed from water is added to the water containing the emanation till the latter is absolutely absorbed by the pulverised substances. The water containing the emanation is then bound by the crystal and enclosed therein. Instead of using water containing the emanation, an aqueous solution of a radium compound can be used and caused to be absorbed or soaked up by the crystals as before mentioned. In this way a durable or resistable preparation is obtained, which can be stored.

Improvements in the Separation of Atmospheric Nitrogen for the Manufacture of Nitrogen Compounds. A. V. Cunnington, 2, Dyar Terrace, Winnington, Cheshire. British Patent, 25,605. November 13, 1906.

For some of the processes concerned with the utilisation of atmospheric nitrogen in the production of nitrogen compounds such as calcium cyanamide, it is necessary to obtain the nitrogen in a more or less pure state. The inventor observes that up to the present the best and cheapest way of doing this has been to liquefy the air and fractionally distil off the nitrogen. This is inevitably a costly method, and, moreover, one which will only give a pure gas when carried out with considerable care and attention. It is claimed that by the present invention nitrogen can be obtained from the air in an almost perfectly pure state, and, moreover, at a very small cost. The process consists of removing the oxygen from the air by passing the latter through incandescent fuel such as coke, preferably with the admixture of regulated quantities of an earthy carbonate such as limestone. The gas so obtained contains carbon dioxide, nitrogen, and mere traces of oxygen, and is passed through an ammoniacal solution of brine in an apparatus designed to give sufficiently intimate contact between the gas and the liquor. By this means the carbonic acid is removed and the nitrogen is obtained in a remarkably pure form; moreover, the bicarbonate of soda which is precipitated during the process from the ammoniacal brine contains the carbonic acid originally derived from the fuel and earthy carbonate.

In carrying out the invention, for instance, in the manufacture of calcium cyanamide by the electrical process, the mixture of carbon dioxide and nitrogen is obtained by the burning of limestone and coke in some form of lime kiln through which the air is passed. By this means the lime necessary for the process is produced, and at the same time the pure nitrogen from the air diluted with little else than carbonic acid, which is utilised in the soda process. In substantially this way, also, the nitrogen can be obtained in the synthetic manufacture of other nitrogen compounds by chemical, electro-chemical, or other means.

Our Book Shelf.

Commercial Organic Analysis, Vol. II., Part III. Acid Derivatives of Phenols, Aromatic Acids, Resins, and Essential Oils. By Alfred H. Allen, F.I.C., F.C.S. Revised by the Author and A. R. Tankard, F.C.S. Pp. 547. London: J. and A. Churchill. 1907. 20s.

The issue of the present volume completes the publication of the third edition of Allen's "Commercial Organic Analysis." It is quite unnecessary for us to emphasise the importance of this work, as it is now regarded as the standard of reference in the branch of analysis with which it deals.

The compilation of the volume under review was commenced in 1898 by its author, but owing to his ill-health the work made only slow progress, and all chemists will join with Mr. Tankard in the regretful reference which he makes, in his preface, to Mr. Allen's untimely death at a comparatively early age. Mr. Tankard observes that those who were privileged to have known Mr. Allen felt not only the loss of a friend but of a master mind, whilst they now miss the benefit of his enlightening knowledge and great practical experience, which were ever at the service of any who solicited his help.

The completion of the volume under notice was undertaken by Mr. Tankard in compliance with the special request of Mr. Allen. Mr. Tankard is responsible for the articles on the Analysis of Caoutchouc, Gutta-percha and Substitutes, and on the Individual Essential Oils and the Terpeneless Oils. The article on Turpentine Oil was written by the author, and has been brought up to date by a few additions. A portion of the author's manuscript was unfortunately lost, and this section (covering pp. 32 to 64) was undertaken by Dr. Henry Leffman, of Philadelphia. In preparing the chapters on Aromatic Acids, Resins and Essential Oils, Mr. Tankard has had the assistance of Mr. E. J. Parry, while Mr. L. Archbutt has assisted in the preparation of the article on Turpentine Oil.

The revision of this valuable work will be welcomed by all chemists who have to deal with organic analysis, and its place in standard analytical literature is now too well assured to call for further recommendation to our readers.

The Book of Receipts (Beasley). Rewritten by E. W. Lucas, F.I.C., F.C.S. Eleventh edition. Pp. 451. London: J. and A. Churchill. 1907. 7s. 6d. net.

The fact that this is the eleventh edition of Beasley's Druggists' Receipt Book is sufficient evidence of the useful nature of its contents and the estimation in which it is held by chemists and druggists. The twelve years which have elapsed since the last reprint of the work have witnessed a great advance in pharmaceutical and manufacturing knowledge, and this has necessitated the rewriting of most of the volume. The general character of the earlier editions has, however, been maintained, and the latest formulæ and methods have been incorporated.

The contents include a Veterinary *Materia Medica*, a Pharmaceutical Formulary, and a Photographical Formulary, while a chapter dealing with urine analysis and the examination of potable waters, milk, sputum, etc., has been added. Part VI. of the volume includes lists of synonyms and incompatibles, a copy of the Poisons Schedule of the Pharmacy Act, a list of poisons and antidotes, lists of volumetric solutions and coefficients, indicators, analytical factors, thomometric and hydrometer equivalents, tables of weights and measures, melting points, solubility tables, and a list of the principal chemical substances used in pharmacy.

Reports of Companies.

CALICO PRINTERS' ASSOCIATION, LTD.

At the annual meeting of shareholders, held in Manchester, on Tuesday last, Mr. R. P. Hewitt, the chairman, referring to the increased capital expenditure, said this was due to the acquisition of businesses and to additions and extensions in works. Speaking of the general balance-sheet, he said that the amount owing by sundry debtors was larger than last year by £183,000. These were thoroughly safe and solid accounts. The stock-in-trade was about £208,000. more than last year. Part of this extra value is owing to the fact that drugs, etc., were increased both in quantity and price. The increased cost of cloth they deplored, but were powerless to prevent. The increased quantity was due chiefly to expanding trade, and partly to a stock taken over with a recently-purchased business. The net profit of £424,040., the chairman pointed out, represented almost 8½% on the whole undivided share capital, as against 7% last year, and they proposed to give to the shareholders the whole of the increased earnings, and at the same time allocate to various reserves, for the upbuilding and strengthening of their future position, the same amount, *viz.*, £150,000., as last year. Calculating this year's profits on the two classes of shares respectively, and before adding £50,000. to capital reserve, they had made the required 5% on preference shares, and 13¾% on ordinary shares. Out of this they proposed to add the customary £50,000. to capital reserve, £75,000. to revenue reserve, and to begin a new reserve of £25,000. as the nucleus of a fire insurance fund. After these appropriations were made they had enough, with the help of a small sum from the carry-over, to pay 6¼% to the ordinary shareholders. The present feature in the Lancashire cotton trade was a lessening of demand, in which the association were at present sharing, apparently due to the high price of cotton now ruling, coming on two or three years' large trade throughout the world, on an average lower price of cloth. This abstinence on the part of buyers everywhere appeared to be adopted from caution and forethought rather than compelled by over-repletion and congestion in foreign markets. Indications already pointed to a resumption of buying on a larger scale as soon as confidence in some level of price was established. In view of what is happening just now in the Cotton Exchanges of America, it was appropriate to repeat what he said last year, that the supreme abiding interest of that association, as of Lancashire, lay, not in scarcity and dearness, but in abundance and cheapness of cotton.

ALBY UNITED CARBIDE FACTORIES LIMITED.

At the meeting of shareholders, on Tuesday last, Mr. A. E. Barton, who presided, said that the accounts showed a loss of £5,443., but this was nothing more than might have been expected in the early stages of such a concern, as it took time to place the business upon a profit-earning basis. The whole of the output of the Alby and Meraker factories for the present year had been sold at prices which were estimated to produce a profit of £30,000. The total estimated profit on carbide already sold on forward contracts was £125,000., and he believed he was justified in saying that the total profit to the company on the year's production would work out at £150,000. Good results were also expected from the sale of cyanamide, which was a fertiliser which might eventually take the place of the Chilian nitrate.

SCOTTISH CYANIDE COMPANY.

An extraordinary general meeting was held in Edinburgh, on Saturday last, for the purpose of considering a proposal to wind up the company voluntarily. Dr. Dawson Turner who presided, said that coal was the largest item in the company's expenditure, and the continued advance in the price had made it impossible to produce cyanide at a reasonable rate. Every 6d. to the price of coal added ⅛ of a 1d. per lb. to the cost of cyanide. The present price of coal added ¾d. to ⅞d. to the cost of production, and it was likely to be increased. The works required 70 tons of coal per day. In addition to this, the price of cyanide, which was 1s. 2d. per lb. when the company started, fell steadily until it reached 6½d. The company's competitors used so little fuel that the increased price scarcely affected them at all. The company had endeavoured to dispose of the works in Fife, and they believed if they went into liquidation there would be a bidder for some of the apparatus. He moved that the company be wound up voluntarily, and Mr. George Redmond seconded. The motion was carried unanimously.

THE NEW AUSTRALIAN TARIFF.—The Board of Trade has now issued, as a supplement to the *Board of Trade Journal*, the text of the new tariff proposals of the Australian Commonwealth. A special abstract of those portions of interest to our readers will appear in our next issue.

THE ASSOCIATION OF CHAMBERS OF COMMERCE.—The Autumnal Meeting of the Associated Chambers of Commerce of the United Kingdom was opened at Liverpool on Wednesday last, Lord Brassey presiding. The President's address was devoted to a consideration of the railway problem; Lord Brassey's speech on this subject will be found summarised in our leader columns. Various important subjects were discussed, including smoke abatement, the proposed Ministry of Commerce, false trade marks, etc. A further report of the meeting will be given in next week's issue.

CYANIDE IN RUSSIA.—The *Ural Technician* states that a cyanide plant estimated to treat 1,000 poods (16 tons) a day was started in July of this year at the Schabroff Lake of the Berisoff Gold Production Co.

THE UNITED STATES GOVERNMENT AND THE STANDARD OIL CO.—On Tuesday last sensational evidence was heard in the New York Federal Court in the Government's action to annul the charter of the Standard Oil Company of New Jersey the parent oil company. The list of securities owned by the Standard Oil Company of New Jersey shows that it holds 9,990 of the 10,000 outstanding shares of the Standard Oil Company of Indiana, which was recently fined $29,000,000. in the Chicago suit, from which it has been allowed to appeal on condition of its lodging in court $6,000,000. worth of bonds. These facts were elicited during the examination of the company's assistant-comptroller, Mr. Rey, who further swore that the gross assets of the Standard Oil Company of New Jersey had increased from $200,791,623. in 1899 to $371,664,531. in 1906, and that in the same period the total profits aggregated $490,315,934., from which dividends amounting to $308,359,430. were paid. Among the foreign stockholdings of the Standard Oil Company, New Jersey, are those of the Anglo-American Company, Limited, 49,987 shares; the Deutsche-Amerikanische Petroleum Gesellschaft 9,000 shares and 20,972 warrants; the Empreza Industrial de Petroleo, 3,500 shares; the Imperial Oil Company, Limited, 14,244 shares; and the Romano-Americano, 25,000 shares. During the further examination of the Standard Oil Co.'s officials, it was shown that Mr. John D. Rockefeller owned 256,854 of the 972,500 certificates of the old Standard Oil Trust, and that during the period from 1899 to 1906 he received £16,034,689. in dividends on his shares. In 1906 the Standard Oil Co. of Indiana, with a capital of £200,000., made profits amounting to £2,103,216., and in the same year it paid dividends amounting to £889,100.

Market Reports.

THE AMERICAN CHEMICAL MARKET.

NEW YORK, Sept. 3, 1907.

(Rate of Exchange, $4.87 = £1.)

Nitrate of soda remains dull, and no business of any consequence has been transacted for the last week. Small parcels on spot can be bought from $2.32. to $2.35. Futures are quoted at $2.42½ to $2.45. Sulphate of ammonia remains quiet, and is in very light demand, while prices generally quoted are $3.07½. to $3.10. for prompt, and $3.05. per 100 lbs. for futures, for either the foreign or domestic. Grey muriate of ammonia for galvanising remains unchanged at 6c. per lb. White electrical is selling rather slowly, and can be bought on spot at 5¾c. per lb. Lump sal ammoniac remains unchanged at 9¼c. per lb. Lump carbonate of ammonia is moving along slowly on contract, very little new business being reported; prices are well maintained at 7⅞c. to 7⅞c. per lb. Bleaching powders are dull at $1.30. per 100 lbs. Sulphate of copper is weak, and the expected reductions have not as yet materialised; however, it can be bought in carloads as low as 6½c. per lb. White powdered arsenic is rather firm; spot parcels are bringing 7⅛c., and futures 7¼c. per lb. Red Saxony arsenic is unchanged. Calcined carbonate potash, 80-85%, is in pretty good demand, and selling at 3¾c. per lb. Hydrated carbonate of potash is rather scarce on spot, and is quoted at 4¾c. per lb. Caustic potash, 75%, is selling at 5¼c. per lb. Chlorate of potash and soda are unchanged at 9¼c. per lb. for prompt. Bichromate of potash is selling rather freely at 8⅛c. to 8¼c. per lb. Bichromate of soda is quoted at 7⅛c. to 7¼c. per lb. Oxalic acid is rather weak, and spot parcels are bringing $8.45.; prices for next year are 6¾c. to 7¼c. per lb.

TAR AND AMMONIA PRODUCTS.

FRIDAY.

Benzols: Values are given at 8d. to 8¼d. for 90's, and 8¾d. to 9d. for 50-90's. Crude tar, 15s. 6d. to 19s. 6d. per ton, Thames; 1¾d. to 1¾d. per gallon, delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 27s., f.o.b.; Gas Company, 29s.; East Coast, 25s. 6d. to 26s.; West Coast, 25s. to 26s. Refined naphthalene, £6. 10s. to £8. 10s. Toluol, 90%, 10d. to 10½d.; pure, 1s. 3d. Carbolic acid, crude, 50%, 1s. 5½d. to 1s. 5¾d.; 60%, 1s. 8d.; 75%, 1s. 11¾d. to 2s.; crystals, 39-40, 5¼d.; 34-35, 5½d. Cresylic, 95%, 1s. 1d. to 1s. 1½d. Anthracene, 40 to 45 per cent. A, 1½d. to 1¾d. Pyridin, 4s. to 4s. 3d.

Sulphate of ammonia quiet. Nearest values are:—Beckton, October-December shipment, £12. 1s. 3d.; Beckton terms, £11. 11s. 3d. to £11. 12s. 6d.; London, £11. 15s. to £11. 16s. 3d.; Hull, £11. 15s.; Liverpool, £11. 17s. 6d.; Manchester, £11. 15s.; and Leith, £12.

Nitrate of soda, ordinary, 11s. 3d.; refined, 11s. 9d.; Liverpool, ordinary, 11s.; refined, 11s. 1½d. Official quotations:—Cargoes off coast or due, 11s. 1½d.; ditto, for prompt shipment, 11s. 7½d.

THE LONDON METAL MARKETS.

THURSDAY.

Copper: Standard brands, £66. 15s. to £67 cash, and £66. 15s. to £67. three months. Tin: G.M. quality, £167. 10s. to £168. cash, and £164. 15s. to £165. 5s. three months; English, £169. Lead: Soft foreign, £20. 10s. prompt; £20. 7s. 6d. for October, and £19. 2s. 6d. for December shipment; English, £20. 15s. Spelter, ordinary brands quiet at £21. 5s. ex ship; hard, £18., f.o.b. Antimony, £43. to £45.; ore, £13. Bismuth, 6s. 6d. Quicksilver, £7. 5s.; seconds, £7. 4s. Aluminium, £155. to £160. Wolfram, 42s. 6d. to 45s. Nickel, 1s. 10d. per lb. Pig-iron closing prices: Cleveland, 54s. 7d. cash, and 54s. 4d. one month.

FERTILISER MATERIALS.

FRIDAY.

Business in all departments for raw manure material is very slow, but prices keep very steady.

There is no change to report in mineral phosphates, raisers having disposed of most of their output for some years ahead, are not anxious at present to commit themselves further.

Digitized by Google

Nitrate of soda is still a quiet market, but prices remain steady, at 11s. 1½d. for 95% and 11s. 4½d. per cwt. for refined quality, ex store.

East Indian bone meal, for shipment, is extremely dull, the quotation being £4. 17s. 6d. per ton nett, c.i.f. terms, Liverpool, 4½ and 52% quality. On spot, £5. 5s. to £5. 10s. per ton, according to quality, is asked.

MISCELLANEOUS CHEMICAL MARKET.

FRIDAY.

In chemicals generally the demand is well sustained, and prices of all heavy chemicals and raw materials seem to be firmly established. In the alkali trade some advances are spoken of as likely to follow the increased price of fuel. Saltcake has been advanced to 42s. 6d. per ton in bulk. Vitriol is dearer. Caustic soda is unchanged for this year's delivery at £9. 15s., f.o.b. Alkali, 58%, stands at £4. 10s., in bags, f.o.r. Soda crystals, 60s. per ton, f.o.r. Bleaching powder is steady at £4. 7s. 6d. to £4. 10s., f.o.r. and f.o.b. Chlorates are unchanged at 3½d. Sulphate of copper is steady, at £24. 10s., f.o.b. Potash, caustic and carbonate, are in steady demand and prices for prompt and future delivery are a shade dearer. Prussiates keep steady at former quotations, and business is more active. Bichromates are unchanged. Acetate of lime, grey, 80%, stands very firmly at £12. 10s., c.i.f. Other acetates and acetic acids are, if anything, a shade easier and more freely offered. All ammonia salts and ammonia are very firm in values.

LIVERPOOL DRYSALTERIES.

THURSDAY.

Montreal potashes quiet. Pearl ash nominal. Cutch steady. Gum arabic steadily held. Gum copal; a small sale of Gold Coast is reported, 59s. per cwt. Logwood and fustic quietly steady at recent currencies. Castor oil quiet, at 3½d. for good seconds Calcutta; 3⅝d. to 3 11/16d. for first pressure French, 3¼d. for second pressure French, and 3⅜d. for Calcutta shipment on to January next. Gambier: Block, 18s. 1½d. on spot; 18s. to 18s. 1½d. for July-August, and 18s. for August-September shipment. Cubes, 28s. 6d. to 29s. on spot, 27s. 9d. for September-October shipment, and 27s. 10½d. for August-September. American powdered starch, 10s. 6d. on spot, and 10s. c.i.f. for shipment; pearl, 9s. 9d. on spot, and 9s. 6d. c.i.f., for shipment. Glucose: American liquid, 43%, 12s. for spot; October-December shipment 11s. 6d. Cream of tartar, 98% foreign powder 81s.; 95%, 79s. Tartaric acid 11¼d. on spot; foreign, 10⅞d. to 11d. Citric acid, English, 1s. 10¼d.; foreign, 1s. 10d.

LIVERPOOL OIL AND COLOUR MARKET.

THURSDAY.

OILS.—Palm oil quiet, sales including Benin £27. 5s. per ton, on spot, and hard oils at £26. 5s. Cottonseed oil steady, at 28s. 6d. to 29s. 6d. for Liverpool refined in export barrels. Linseed oil firm at 25s. 6d. to 26s. for Liverpool makes in export casks. Tallow steady at 31s. to 31s. 6d. for Norths, and 33s. 6d., c.i.f., for South American beef. Rosin steadily held. Turpentine firm at 40s. per cwt. on spot. Petroleum firm at 6⅞d. for Russian and Roumanian, and 7¼d. to 8¼d. for American refined oils. Petroleum spirit steady at 1s. 0¼d. to 1s. 3d. per gallon.

COLOURS.—Red lead, English, £21. 10s.; white £22. 10s. to £22. 15s.; emerald green, 1s. per lb.; Brunswick green, 16s. to 45s. per ton; Venetian red, lump, 7s. 6d.; powder, 5s. to 6s. 6d. per cwt.; vermilion, English, 2s. 4d.; China, 3s. per lb.; Prussian blue, 1s. 10d. to 2s. 6d.; Brunswick, 28s. to 34s. per cwt.

TYNE CHEMICAL REPORT.

THURSDAY.

The market continues fairly steady, with about a normal demand. Caustic soda, 70%, £9. 15s., and 76-77%, £10. 10s. per ton. Bleaching powder quiet at £4. 15s. to £5. 5s. per ton. Soda crystals locally firm at £2. 17s. 6d. to £3. 2s. 6d. per ton gross weights. Sulphur steady at £5. to £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £10. 10s. per ton, nett; do., 70%, £9. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 2s. 6d. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £29. 10s. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—The market continues steady, and current prices are:—Best Northumbrian steam coals, 16s. per ton; seconds ditto, 14s. to 14s. 9d. per ton; small steam coals, 10s. to 11s. per ton; best gas coals, 15s. 6d. to 16s. per ton; Durham Bunkers, 13s. 3d. to 13s. 6d. per ton; coking coals, 14s. 6d. per ton; household coals, 16s. 6d. to 17s. 6d. per ton; foundry coke, 25s. per ton; gas coke, 20s. per ton.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, THURSDAY.

The late abnormally stationary position of sulphate of ammonia, Leith and Glasgow business, still continues, the quoted prices for prompt remaining the same, and fairly firm, although the actual sales are but of moderate volume. Sulphate of copper is again easier, and values lower, following the metal market. Both prussiates and chlorates lean to the fall, and prussiate of potash and chlorate of potash are a fraction cheaper. The heavy chemicals are unchanged, the demand keeping steady and late price figures firm. Saltcake steady again, at 40s. for prompt, and with some mention of forward business done at the same figure. Mineral burning oils of Scotch make are practically all by this time contracted for ahead, at the season's agreement price as given below. Home makes of lubricating oils, naphthas, and solid paraffins all steady as before.

Chief prices current are:—Alum (in lump), £5. 5s. to £6., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37%, £4. 12s. 6d. to £4. 17s. 6d., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £10. 10s.; 70-72°, £9. 15s.; 60-62°, £8. 15s.; and cream, 60-62°, £8. 15s., all nett, Liverpool; chlorate of potash, 3½d., nett, Glasgow; creosote (ordinary coal tar and blast-furnace), 2¼d. to 2½d., naked, f.a.s. Glasgow; nitrate of soda, 11s. 1½d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2¼d. to 2½d. per lb.; paraffin wax, 120° semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¾d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating), 865°, £5. 12s. 6d. to £5. 17s. 6d.; 885°, £6. 7s. 6d. to £7. 7s. 6d.; 890-895°, £7. 2s. 6d. to £8. 2s. 6d.; prussiate of potash, 5¾d. to 5¾d. nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 40s.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £3. to £3. 2s. 6d.; sulphate of ammonia, £12. to £12. 1s. 3d., prompt f.o.b. Leith; sulphate of copper, £25. 5s., to £25 10s., less 5% Liverpool, prompt.

New Companies.

Volatile Solvents Recovery Co., Ltd.—Capital £1,500., in £1. shares (600 founders'). This company has been formed to acquire and turn to account certain inventions and patents relating to the recovery of volatile solvents used in various manufactures, and to adopt an agreement with C. Harrison, W. Bate and W. C. Perks. Minimum cash subscription 50% of the shares offered to the public. The subscribers are to appoint the first directors; qualification £50.; remuneration (excepting managing directors) 40% of the profits remaining after providing for a dividend of 10s. per share, divided. Failing sufficient surplus, remuneration to be fixed by the company). Registered office, 6, Bread-street Place, E.C.

Digitized by Google

Liverpool Barytes Co., Ltd.—Capital £20,000., in £1. shares. This company has been formed to acquire any mines, mining rights and metalliferous land in Ireland or elsewhere. No initial public issue. The first directors are E. D. Storer, A. F. Storer, J. I. McConnell, F. D. Roscoe and H. W. Wilson. Qualification 500 shares; remuneration £50. each per annum.

Brazilian Manganese Corporation, Ltd.—Capital £1,000., in £1. shares. This company has been formed with objects as indicated by the title. No initial public issue. Registered without articles of association. Registered office, 33-37, Eldon-street House, E.C.

Peruvian Rubber Co., Ltd.—Capital £250,000. in £1. shares. This company has been formed to acquire a concession for the construction of an inland road, 120 miles long, from Phara, province of Sandia, to a point navigable by steamer on the Tambopata River, granted to M. Forga and Sons, and transferred with the consent of the Peruvian Government to La Compania Gomera Villamayo Limitada, of Arequipa, Peru, to complete the construction of the said road (on which completion the company will be entitled to select, subject to the approval of the said Government, titles to grant in perpetuity of 420,000 acres of land), to immediately acquire about 80,000 acres of rubber-bearing forest land on the said river, now held on lease from the Government of Peru at a royalty of about 4s. per 100 lbs. of rubber extracted, apart from Customs duties (the leasehold merging into perpetual ownership under the aforesaid concession), and to carry on the business of cultivators of and dealers in rubber, tobacco and other produce, etc. Minimum cash subscription 50,000 shares. The British Investment Syndicate, Ltd. are the vendors. Purchase consideration £25,000. cash, £25,000. cash or shares at the company's option, and £75,000. shares (vendors paying preliminary expenses, estimated at £6,500). The vendors will pass over to the Compania Gomera Villamaya, Limitada, £20,000. cash and £10,000 shares out of the said consideration. The first directors are Major-General Sir John C. Ardagh, V. M. Caceres, Sir Ernest Clarke, J. Irvine, F.R.C.S., E. Lembcke, F. W. Schafer and O. Wethered; qualification £250.; remuneration £250. each per annum (£100. extra for the chairman) and 5% of the distributed profits, divided (such percentage not to exceed £5,000. in any year). Registered office, 131-3, Dashwood House, E.C.

NOTICE.

Correspondents will please note that our Manchester address now is

Barton House,
66, Deansgate.

LATE ADVERTISEMENTS.

FOREMAN Wanted, capable of plant erection and working, degreasing, deglueing bones, to manage workmen, also attend to office during manager's absence.—Apply, in confidence, age, salary required, experience, references, to "Glue," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

QUALIFIED Chemist, with considerable manufacturing experience, rapid technical analyst, now disengaged, desires appointment.—"1,513," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

MANAGER disengaged; 14 years' factory experience, chemistry, engineering, surveying, building and erecting, acids and explosives.—"1,514," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

WANTED, a Bone Mill (Nicholson's or other make). Also a Glue Evaporator.—Give size, price, particulars, to Southern Fat and Bone Company, Rainham, Kent.

Notices.

All communications for the *Chemical Trade Journal* should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C.

Our Registered Telegraphic Addresses are:—
"Trepex, London."
"Expert, Manchester."

Our Telephone Numbers are:—
London: 13692, Central.
Manchester: 3060.

Back Numbers of the Journal:—In future all back numbers will be charged at 6d. per copy, plus postage.

CARBONIC OXIDE POISONING.

THE Annual Report of the Chief Inspector of Factories (already partly summarised in recent issues of the *Journal*) contains several references to cases of poisoning by carbonic oxide which appear to call for emphasis, in view of the increasing use of producer-gas. The Superintending Inspector for the North-Eastern Division, in that part of his report which deals with industrial poisoning, quotes the observations of one of the District Inspectors, who points out that a serious case of carbonic oxide poisoning occurred in a works having a Dowson gas plant; a complaint having been received that persons in an adjoining factory had occasion to suspend work, and were more or less affected in health, by an escape of gas, it was found on inquiry that the Dowson gas plant referred to was the cause of the trouble. The producer was situated partly in the open air, under a shed between the two factories, and had a defective gasometer, which was made in the ordinary cylindrical form of thin plates. Some of the plates had rusted away, through exposure to the weather and neglect of painting, so that an escape of gas occurred at the joints and at various points in the centres of the sectional plates on the dome. The Halifax Inspector goes on to state the amazing fact that the only precaution taken to prevent this escape of gas was to cover the holes with moist clay, and to lay coarse sacking and weights over them. This was, apparently, the condition of the gasholder for some months, but, as might have been expected, the expedients acted only for a short time, as the gas bubbled through the wet clay and necessitated frequent renewals daily. Although the attendant had been "gassed" several times—being once picked up insensible—and although the attention of the firm was drawn to the danger, the working of the plant was continued. The Inspector eventually obtained an order under which the use of the plant was prohibited.

Although it would hardly seem necessary to emphasise the need for careful supervision in the generation and use of producer-gas, cases such as the one mentioned above show that the increasing use of gas producers must be accompanied by intelligent supervision if serious cases of "gassing" by carbonic oxide are to be avoided. It is scarcely possible for such ignorant manipulation of gas-producer plant to occur in a chemical works; but the fact remains that many factories of a non-chemical character are now employing gas producers, and it is in such works that serious accidents may be anticipated. Ordinary textile factories, for instance, will probably have no person on the staff possessed of chemical knowledge, and under such circumstances, where ignorance of the insidious nature of carbonic oxide exists, it is very easy to understand that frequent cases, more or less serious, of "gassing" may occur.

The Home Office issue a Memorandum on this subject to those manufacturers who have adopted suction-gas plants,

Digitized by Google

but it seems necessary that the non-chemical manufacturer should be further educated to the importance of observing extreme caution in the working of gas producers, and, further, in the methods to be adopted in the unfortunate event of "gassing" accidents occurring on his premises. In this connection we may once more remind our readers that the use of the "Rules for Dealing with Dangerous Gases," introduced by us in 1896, and of which several thousands have now been distributed, will do much to prevent "gassing" accidents. Some such regulations should be enforced in all works or factories in which producer-gas is generated or used, and suitable appliances of the "rescue" type should be provided. Lamentable ignorance still prevails on this subject, and we must look to the officials of the Home Office to do for factory owners and manufacturers generally what has already been in great measure accomplished in connection with chemical works in particular.

ELECTRICAL POWER IN FACTORIES AND WORKSHOPS.

THE Home Secretary has issued a draft of regulations which he proposes to make for the generation, transmission, distribution and use of electrical energy in premises registered under the Factory and Workshop Act. It will be remembered that in 1904 draft Regulations were issued by the Home Office based on existing requirements of the Board of Trade, having reference to the use of electrical energy at medium pressure. It was found, however, that although the requirements had been for some years in force as Board of Trade Regulations, many difficulties arose in regard to their enforcement as Regulations under the Factory Act. As the proposed Regulations covered only part of the ground which had eventually to be covered, the Secretary of State decided to defer the consideration of them until a more complete code could be prepared.

The present draft applies to the generation and transformation, as well as the distribution and use, of electrical energy on all premises under the Factory Act, and at all pressures above 130 volts continuous and 65 volts alternating. In adopting the above limitations on the basis of pressure, the Home Secretary, while realising that there may be danger at still lower pressure, has been guided by the fact that the serious accidents from shock which have come to his notice have been at pressures exceeding those named. Special consideration has been given to the conditions under which preventable accidents have arisen. The Home Secretary regrets to learn that while in many electrical installations the utmost care has been taken to prevent unnecessary danger, there are striking exceptions to this rule, even in work recently carried out. In drafting the regulations the Home Office rules for the use of electricity in mines, the various Board of Trade rules, including those already referred to for the use of electrical energy at medium pressures, the rules of the Institution of Electrical Engineers, and of fire insurance offices have been consulted. Some of these prescribe details to a greater extent than would be possible in regulations applicable to such a wide field as is now in question; and in many points it has been thought to be more expedient, in view of the rapid development of electrical engineering, to indicate broadly the dangers to be avoided and the nature of the precautions required, than to define particular means of securing the necessary safety. It appears often to be thought that where the supply of electrical energy is at low pressure there is no danger of shock, or rather that there is no danger to life from a shock at such pressure. It has, however, been abundantly proved that this is not the case. Fatal cases of shock at low pressures are by no means of rare occurrence. Accidents from shock may occur by a person making contact simultaneously with two live conductors at different pressures, but more usually by merely touching one conductor whilst being in contact with the ground. A mere momentary contact with a conductor at low pressure, even when standing on damp ground, may not produce a serious shock, but a person who happens to grasp the conductor may be quite unable to release his hold, and the shock is prolonged until assistance comes. In such circumstances it may take only a few seconds for the shock to prove fatal. The dividing line between the conditions which will render the shock merely trifling and those which will render it fatal is so narrow that it becomes necessary to provide, so far as is practicable, that no shock shall be received at all.

In accordance with the requirements of the Factory Act, the regulations are now published in draft, and are subject to further consideration. Any objections of substance, made by employers, workpeople or other persons affected, will be carefully considered by the Secretary of State, and will, if necessary, be the subject of full inquiry made by a competent person appointed by him. In that event the owners, occupiers, employers, workpeople and all others concerned will be entitled to a full hearing at the inquiry, and the report of the person holding it will be considered by the Secretary of State before the regulations are made.

If, therefore, any person desires the regulations to be further considered, he should lodge objection in accordance with section 80 of the Factory Act, and in pursuance of that section the Secretary of State gives the following notice:—That he proposes to make regulations dealing with the generation, transformation, distribution and use of electrical energy in factories and other places to which the Factory Act applies, in accordance with an enclosed draft, copies of which may be obtained on application to the Factory Department, Home Office, London, and that any objection with respect to the draft regulations by or on behalf of any person affected thereby must be sent to the Secretary of State within forty days from this date. Every such objection must be in writing, and must state (*a*) the regulations or portions of regulations objected to; (*b*) the specific grounds of objection; and (*c*) the omissions, additions, or modifications asked for.

NITRATE OF SODA.

IN spite of expected small September shipments from Chili, and the continued absence of arrivals at ports of call, business is a dead letter, with prices somewhat weaker again in Continental markets. A cargo which arrived at Plymouth on July 30 is still awaiting orders! Spot is quoted 11s. per cwt. in Hamburg, and prompt shipment 8s. 11d. per quintal, f.o.b. Chili, compared with 11s. 7½d. and 9s. 5d. respectively at this time last year, when markets had a strong upward tendency. The only incident in favour of holders has been a fire in Iquique, which is said to have caused the destruction of a considerable quantity of the fertiliser. More interest seems for the moment to be taken in nitrate shares than in nitrate of soda, and yet another company (the "Lilita") has made its appearance as a candidate for British capital. It is a small concern, intended to produce only 16,000 tons per annum, but the annual profit is estimated at £54,000. on the basis of a cost of 5s. 6d. per quintal, f.o.b., and a selling price of 8s. 6d. With regard to the latter figure the prospectus discreetly "assumes the continuance of the Nitrate Combination"!

THE GROCERS' EXHIBITION.

A COMPLETE review of the Grocers' Exhibition, which was opened at the Royal Agricultural Hall, Islington, on Saturday last, and which closes to-day (Saturday) would be beyond the scope of this *Journal*, but the exhibits of soaps, disinfectants, grinding and mixing machinery, etc., are highly interesting.

Messrs. Wm. Gardner and Sons are exhibiting a large number of their grinding and sifting machines, including one specially designed for powders requiring fine dressing. Either a silk or wire mesh can be employed in the latter machine, as all coarse or gritty matter is automatically removed from the powders and discharged from the mixer. A patent fixing device allows of the dressing cover being quickly removed and a finer or coarser one substituted, thus rendering the machine applicable to a variety of purposes. Another machine, which has for its object the blending of all kinds of powders, is the "Colunio" mixer. This mixer is exhibited by Mr. Caleb Duckworth, of Colne, and is adaptable to either hand or steam power.

The Sanitas Company's exhibit consist of an attractive display of disinfectants, soaps, Kingzett's sulphur candles, "Okol," and "Special Sanitas" Bactox. Disinfectants and soaps also form a prominent feature of Pearson's Antiseptic Company's stall. Besides the above mentioned, several other firms devote their stalls principally to a display of various makes of soap, amongst whom are the "Vinolia" Co., Ltd., Sapon, Ltd., T. B. Rowe and Co., Ltd, The Chiswick Soap and Polish Co., Maypole Co. (1899), Ltd., and Armour and Co., Ltd.

Digitized by Google

It is interesting to note that Messrs. Werner, Pfleiderer and Perkins, Ltd., whose mixing machines are well known to chemical manufacturers, are the makers of theModel Bakery in the Minor Hall of the Exhibition.

The Salt Union exhibit various qualities of salt, the City of London Wood Co. show "Elastene" wood fibre for packing purposes and "Elastene" wood fibre for filtering water, and Young's Patent Hygienic Bin Co. have a display of storage bins made of galvanised steel, without corners or crevices

The promoters are to be congratulated on the efficient and excellent manner in which the Exhibition has been organised.

Reports of Companies.

BRITISH COALITE CO., LTD.

The statutory meeting of shareholders was held on the 20th inst., Mr. A. G. Kitching presiding. The Chairman said that during the last three months the manufacture of coalite had been cheapened and expedited, and it was anticipated that, in the near future, it would be made in less time and at less cost than was mentioned in the prospectus. Replying to criticisms which had been directed against them, the Chairman said one of these was to the effect that too much had been paid to the inventor. He contended that the price paid to the inventor was honourable, fair, and reasonable. Furthermore, he did not get a farthing until the shareholders had received 6%. Another point was their contract with Messrs. Wm. Cory and Sons. They had come to this arrangement because they preferred co-operation rather than competition. He was firmly convinced that this contract would be to the advantage of both parties, and would prove a most valuable asset to the British Coalite Co. With regard to the question of the estimated profits, as only £750,182. had been subscribed, they did not expect to earn profits as large as had been anticipated had the whole of the £1,500,000. been subscribed; but, on the other hand, there would be less capital upon which to pay dividends. They had about 3,500 shareholders. As to what had been done, they had accepted tenders for a considerable number of stills in which to manufacture their coalite at Barking, which were to commence to be delivered within a week. They anticipated that the first would be in position and ready for work by the end of November. The purchase of the Company's freehold land at Barking was being completed, and the company was taking possession. The coalite plant at Wednesfield, near Wolverhampton, was, in the meantime, continuing to manufacture coalite, and the purchase of 60 acres of freehold land at Wednesfield had been completed. This land, when bought, was believed to contain coal beneath the surface, and it had now been tested by one of the most experienced colliery engineers in England, who estimated that over a million tons of coal, of the kind known as "Staffordshire thick seam," lay immediately beneath the surface, and was easily workable. This was very important to the shareholders, as the land for which they had paid £15,500. was now worth several times that amount, and thus the company would be provided with cheap coal for many years to come.

The Chairman proceeded to explain the difference between coalite and coke, and said they need not fear competition in this direction. He was authorised to inform the proprietors of the Coalite Company that negotiations were in progress, and would be completed in the course of the next few days, with one of the most important gas companies in the kingdom for the erection of a coalite plant on the land and near the works of the gas company, to make half a million of cubic feet of gas daily, which would be disposed of to the gas company on advantageous terms. The Coalite Company would themselves retain and deal with the coalite and other by-products. He believed that this would be followed by many agreements of a similar character. The directors were quite satisfied with the progress which had been made, and had absolute confidence in the future of the Company.

After a short discussion, the proceedings terminated with a vote of thanks to the Chairman.

ANGLO-SICILIAN SULPHUR COMPANY.

The annual meeting of shareholders was held on Tuesday last. Mr. W. T. Brand, who presided, said that the statements made by him at the meetings in June and November of last year as to a satisfactory return of capital were likely to be fulfilled. If the proposed resolution for the liquidation of the company were passed, he hoped that the liquidator might be able to return the capital to the preference shareholders towards the end of October, and that the ordinary shareholders would receive a most satisfactory return on their shares. Every ordinary shareholder who eleven years ago took a shilling share in the company would have received 4s. 2d. as dividend during that period, and, in addition, would receive, he hoped, at least 4s. more, so that in eleven years they would have had, in addition to the return of 1s. of capital, 8s. 2d. per share.

The report was adopted, and resolutions were afterwards passed for winding-up the company voluntarily, and appointing the Chairman as liquidator at a fixed remuneration of £1,500.

THE MANCHESTER GAS EXHIBITION.

SOME twelve months ago, the Manchester District Institution of Gas Engineers decided that it was expedient to initiate a movement for the promotion of an exhibition of gas appliances. The general knowledge of the public with regard to the uses of gas for purposes other than lighting was considered to be such that full justice was seldom given to the heat-giving value of coal gas.

Mr. Cawood, of St. James's Hall, Manchester, was approached in the matter, and an Advisory Committee was formed consisting of members of the Councils of the Society of British Gas Industries and the Manchester District Institution of Gas Engineers, with Mr. Thomas Newbigging, M.I.C.E., as Chairman. Under the auspices of these gentlemen, all of whom are experts in their own particular branch of the gas industry, the arrangements for the forthcoming Exhibition have been completed.

In the allotment of space, all applications have come before this Committee, and particular care has been taken in such allotment, the aim of the Committee being to give a unique demonstration of the best and most modern methods of applying coal gas in metallurgical purposes and in the engineering and mechanical industries. There will also be on show improved systems adapted for use in the textile industries. At the Exhibition demonstrations will be given having for their object the gaining of the confidence of the general public and at the same time to furnish them with useful information.

The Committee consider that though it is a well recognised fact among scientists that gaseous fuel in many industrial purposes is by far the cheapest and handiest, yet in the past the firms employing it have kept the methods of using and the apparatus to some extent as a trade secret. At this Exhibition members of the Committee and various exhibitors will be ready to give advice as to its adaptability in new fields.

Of late, Manchester and other Lancashire towns have been greatly occupied with the question of smoke nuisance. In the Smoke Abatement Section there will be shown the most modern smokeless appliances for the heating of domestic houses, halls, and public buildings by gaseous fuel, and with a view to giving that confidence to gas consumers which, in the past, has been lacking, there will be an exhibit of a new appliance for enabling the gas consumer to ascertain and check the amount of gas used on any or all of his gas appliances, either combined or separate. Users of power will have at this Exhibition the advantage of being able to attend a lecture on gas engines given by an eminent authority, Mr. Dugald Clerk, M.I.C.E., President of the Society of British Gas Industries. There will also be lectures on smoke abatement, by Mr. J. W. Graham, M.A., Principal of Dalton Hall, Manchester, by Mr. J. B. Cohen, Ph.D., B.Sc., of the Leeds University, an interesting popular lecture on domestic heating and ventilation by Mr. R. H. Clayton, B.Sc., F.C.S., and further lectures by Mr. J. H. Brearley, of Longwood, on gas fires, Mr. J. G. Newbigging, M.I.C.E., of Manchester, Mr. S. Muenier, of Stockport, Mr. Tim Duxbury, of Oldham, and Mr. Kendrick, of Stretford, gentlemen who are at present in charge of local gas undertakings. In the Lighting Section there will be an exhibit showing the evolution of gas lighting from its infancy down to the present date. The principal rival systems of lighting by incandescent burners and by high-pressure, compressed, and other systems will be on view.

The Exhibition is to be opened on October 23rd, at 3 p.m., by the Lord Mayor of Manchester, assisted by the Mayor of Salford, and closes on November 9th.

CHANGE OF ADDRESS.—From a notice on another page, our North-country readers and clients will see that our Manchester address now is Barton House, 66, Deansgate.

CHEMICALS, ETC., IN JAPAN.

(*Concluded from p. 217*).

METALS also showed a very noteworthy advance from £1,933,543. in 1905 to £3,046,809. in 1906, an increase of over 57%. Here, however, the importance of the group is practically decided by one item, that of copper, which was responsible for 84% of the total. The copper mines are extensive, and in 1904 Japan ranked fifth on the list of copper-producing countries. The great increase in the export was due to the great advance in the price of the metal throughout the world. Prices opened early in the year (for Furukawa Bessemer) at about £77. 15s. per ton, and advanced to £97. 13s. and even £103. 14s. per ton before the year closed. Under the heading of "Oil and wax" the largest increase was in fish oil (mostly from herrings), which advanced from £75,881. to £124,846. Business was generally good, especially in the latter half of the year, when the demand increased considerably. In January the price per cwt. was about 10s. 1d., falling later on to 8s. 8d., and rising again before the end of the year to 12s. 7d.

The following were the leading imports from the U.S.A.:—Kerosene oil, £976,000.; paraffin wax, £140,000. Exports from the same country were:—Copper, refined, £263,000.; camphor, £124,000.

From China, imports were:—Manure (mainly oil cake), £1,658,000.; cottonseed, £104,000. Exports to China:—Matches, £509,000.; copper, £455,000.

The principal German imports were:—Drugs, chemicals, etc., £431,000.; Artificial indigo, £896,000.; aniline dyes, £2[illegible],000. Exports to Germany included:—Refined copper, £244,000.; fish oil, £60,000.; camphor, £52,000.

Imports from France were:—Drugs, medicines, etc., £36,000. Exports to France were:—Refined copper, £219,000.; camphor, £109,000. Corean imports were:—Manures £47,000.

Amongst commodities in which the British Empire is interested were the following:—Carbolic acid (£5,610. out of £20,120., mostly from Germany); alcohol (£1,290. out of £18,790., mostly from Germany); subnitrate of bismuth (£8,710. against £28,160. from Germany); chlorate of potash (£37,970. out of £112,150.); while, of course, in the valuable aniline and alizarine dye trade the British share is practically nil.

In 1905 nearly 70% of the import of rape seeds came from India; in 1906 the Indian total was only £5,600. out of £53,380., the remainder being nearly all from China.

There were considerable imports of zinc. In the case of blocks, ingots and slabs, the imports were £65,280., of which the share of the United Kingdom was only £11,250., the greater part coming from Germany and Belgium. In 1905, when the total imports were over three times those of 1906, the British share was upwards of £59,172., so that further British imports seem possible, especially as they were slightly cheaper than those from Belgium. Similar remarks apply to sheet zinc, over 70% of the import of which came from Germany. Here, however, the British product is considerably dearer.

The total amount of import duty collected during 1906 was £4,208,936., against £3,501,307. in the previous year. Looked at as a whole, the new tariff must be regarded as based on scientific principles and designed to give the maximum opportunity for the development of Japanese industries, and also to be of as great assistance to the revenue of the country as possible. It is not likely that the new tariff in itself will lead to any diminution of the import trade. Doubtless individual items and groups of items will suffer, partly from the prohibitive rates of duties and partly because Japan herself will probably be able to supply the demand. On the other hand, the development of the country will call for new appliances and greater supplies of material, while the growth of luxury will create new demands only to be satisfied, for a time at least, from abroad.

Potash Salts.—At last week's meeting of the Potash Syndicate, in Berlin, the decision in regard to the admission of the Heldrungen and Günthershalls Companies was postponed, pending evidence of output capacity. An increase of about £160,000. was reported in the value of deliveries in the first eight months of the current year, compared with those in the corresponding period in 1906; the recent expansion must have been considerable, since the first six months showed a decrease. A sum of £5,000. was voted to Herr Schreiber, a retiring member of the Board, a *douceur* reminiscent of those distributed by the Nitrate Combination.

Continental Notes.

IN the *Chemiker-Zeitung* for August 31, Dr R. Cohn writes on the salting out of cocoanut oil soaps as a means for the detection of this fat. The method depends upon the fact that the fatty acids in cocoanut oil consist largely of capric, caproic, and caprylic acids, the soaps of which are comparatively soluble in brine. The aqueous solution of the soap to be examined is therefore salted out with common salt, and the filtrate is tested with hydrochloric acid. The presence of quite a small proportion of cocoanut oil will cause a turbidity. The method can be used for ascertaining whether cocoanut oil has been used to adulterate oils and fats such as tallow, margarine, sesame oil, cottonseed oil and palm oil. It can even be applied to butter, but in this case a slight modification of the method has to be used, as the butter itself contains a small proportion of fatty acid that is difficult to salt out.

In the same issue R. Freygang describes a plant for separating the slimes from ores, or for treating ores with liquid such as the cyanide solution used in gold extraction. The machine consists of an inclined tube, within which there is a worm turned by means of gearing. Water and the ore are made to enter the tube at its lower end, and the ore is driven up by means of the worm. The stirring it receives causes any clay or other slimy material to go into suspension in the water, which carries it away through an overflow pipe. When used for extraction purposes the procedure is the same, except that the extracting liquid is run in, instead of water; in order to make the extraction more complete the ore can be made to pass through several of the machines, each one feeding into the next.

In the issue for September 4, Prof. von Drigalski writes on the removal of iron from water supplies by means of closed plants. He gives the results of the bacteriological examination of the water supply of Hanover before and after the iron has been removed from it by means of the Bock pressure filter. These results show that the number of bacteria is not increased by this treatment; this is in contradiction of the statements recently made by Schlegel and Mergel.

E. Schultze's recent paper, in which he stated that the free phosphoric acid in superphosphate cannot be determined with accuracy, has called forth a reply from Dr. W. Möller in the *Chemiker-Zeitung* for September 7. From the fact that the oxalate method gives results that are practically identical with those obtained by the old ether method and Schucht's acetone method, he concludes that the figures are sufficiently reliable for practical purposes. He considers that this determination is only of interest to the manufacturer, who is obliged to have a certain proportion of free phosphoric acid in the fertiliser in order to produce a satisfactory product, and this proportion has to be varied according to the nature of the phosphate that is being used.

In the same issue there is a paper by M. Nierenstein, on the constitution of tannin.

The work of Professor T. W. Richards as a laboratory technicologist is the subject of a communication by Dr. P. Köthner to the issue of September 11. In the course of his extensive researches on the atomic weights the great American scientist has worked out or devised a large number of appliances for use in the laboratory, and these are not only more accurate than those usually used, but in many cases are more convenient also. For distilling water and other liquids, for instance, he uses a very simple flask, condenser, and receiver, which does not allow the steam or water to come in contact with rubber or other organic material, and yet the apparatus has no ground joints. Other appliances that are illustrated are a small porcelain centrifugal, an electric heating bath, a nephelometer for measuring the quantity of solid held in suspension in the liquid, and a glass appliance for filling a weighing tube with substances that have to be kept in special atmospheres. During Richards' stay in Berlin he has communicated these and many other methods to the students who attended his courses. Richards may be considered as the successor of the earlier workers upon atomic weights, Berzelius and Stas, but whereas they worked alone, Richards has educated a number of assistants and has infused them with his own spirit of care and accuracy. This is no doubt a more difficult task than to do the manipulations alone, but it has the advantage that it not only increases the amount of work that can be done, but also creates a school of atomic weight chemists, who can carry on the traditions. The writer ends by calling attention to the great advantages that are derived from the interchange of professors between America and Germany.

The Patent List.

This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of G. Keville Davis, who reports professionally upon the value of Chemical Patents.

APPLICATIONS FOR BRITISH LETTERS PATENT.

Oils and Greases. E. Ridgill. 20,059. September 9.
Funnels. J. P. Jackson. 20,078. September 9.
Concentrated Acetic Acid Hydrate Solution from Dilute Acetic Acid Solution. G. B. von Belatini. 20,125. September 9.
Slime Filters. L. S. Burt and J. Thame. 20,175. September 10.
Centrifugal Drying Machines. J. W. Macfarlane and W. A. Macfarlane. 20,178. September 10.
Hydro-Extractors. E. L. Collon and G. Tabard. 20,211. September 10.
Obtaining Constant Temperatures. British Thomson-Houston Co. Ltd. 20,228. September 10.
Suction Gas Producers. F. J. Bennett and W. Tapley. 20,233. September 11.
Drying and Calcining Ores and Ore Earths. A. W. Farnsworth. 20,249. September 11.
Furnaces for Roasting and Calcining Ores. W. Smethurst and the Arenic Gold Mining Co. 20,277. September 11.
Atmospheric Air, Separation of the Constituents of. La Société L'Air Liquide. 20,349. September 12.
Gas Producer Plants. W. *N.* Tonkin and S. Fuplett. 20,352. September 12.
Ortho-nitrated Amino-derivatives of the Benzene and Naphthaline Series. A. G. Bloxam. 20,367. September 12.
Apparatus for Filling Casks. C. Sellenscheidt. 20,374. September 12.
Lining for Filter Elements. C. Sellenscheidt. 20,375. September 12.
Silicates of Magnesia. H. Herenschmidt. 20,378. September 12.
Product from Albumen. P. Leuthardt-Thornton. 20,381. September 12.
Extraction of Sulphur from Sulphur Compounds. S. O. Cowper Coles. 20,386. September 12.
Disinfectant and Insecticide. F. W. Howorth. 20,387. September 12.
Crushing Machines. G. H. Fraser. 20,395. September 12.
Centrifugal Separators. J. Birtwistle. 20,412. September 13.
Sifter and Mixer. C. E. Gardner. 20,453. September 13.
Removing Superphosphate from the Decomposition Chamber. K. J. Beskow. 20,466. September 13.
Purification of Sulphuric Acid from Arsenic and Selenium. H. W. Crowther, F. P. Leach, and W. T. Gidden. 20,509. September 14.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 8d. *in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery-lane, W.C.*

1906.

Treating Slimes. Goschen. 13,275.
Arylated Derivatives of 2-amino-5-naphthol-7-sulphonic Acid and Arylated Derivatives Produced thereby. Bloxam. 19,962.
Utilisation of Waste Liquor from Galvanising Iron. Thomson. 20,057.
Xanthates of Certain Carbohydrates. Cross and Briggs. 20,638.
Metal Drums for Containing Cement, etc. Heil. 20,898.
Anthracene Derivatives. Newton. 24,429.
Paint Removers. Reihl and Waters. 27,092.

1907.

Removal of Arsenic from Liquids and Gases. Johnson. 974.
Centrifugal Separators. Prollius. 2,596.
Obtaining Highly Concentrated Nitric Acid. Gontard and Valentiner. 4,254.
Smoke-consuming Appliances. Keighley. 7,603.
Feed-water Heaters and Purifiers. Stevens. 10,353.
Sheep Dip. Moore. 11,132.
Centrifugal Separating Apparatus. Spengler and Sommerschuh. 18,147.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in or Relating to the Recovery of Vapours given off by Volatile Liquids. H. Diamanti, 3, cité Trévise, Paris, and Charles Lambert, 3, rue Turbigo, Paris. British Patent, 5,019. March 1, 1907.

This invention consists in effecting the liquefaction of the vapours of the volatile liquids by contact with suitably arranged cold walls, whilst at the same time, in order to avoid re-volatilisation, the drops of liquid thus obtained are sheltered from the action of the surrounding air, the drops being collected immediately in a tube or a recipient of suitable shape kept at a very low temperature.

Process for the Manufacture of Peroxide of Potassium, or of a Mixture rich in Peroxide of Potassium. G. F. Jaubert, 155, Boulevard Malesherbes, Paris. British Patent, 7,641. March 30, 1907.

The inventor claims: (1.) A process for manufacturing pure peroxide of potassium, or a mixture rich in peroxide of potassium, consisting either in heating moderately under the influence of a slow admission of air, an alloy of potassium with a metal such as lead, zinc or sodium, or in transforming, in a liquid alloy of potassium and sodium, first of all the potassium into oxide of potassium by means of air at ordinary temperature and continuing its oxidation after the separation of this oxide. (2.) A method of carrying into practice the process in accordance with Claim (1), consisting, with alloys of potassium and sodium very rich in potassium, in converting the whole of the alloy into peroxide at as low a temperature as possible in order to oxidise first the potassium and then the sodium to the end of obtaining a mixture of the two different peroxides.

Improvements in Methods of and Apparatus for Refining Tin Electrolytically, particularly for Extracting Pure Tin from Alloys, Wastages, Residues, and the like, with the Extraction of the Foreign Metals. O. Steiner, Tannenstrasse, 113, Krefeld, Germany. British Patent, 10,230. May 2, 1907.

This invention relates to a method of refining crude tin electrolytically and extracting pure tin from alloys, etc., electrolytically, in an alkaline sulphur solution, and is characterised by the use of tin cathodes and homogeneously soldered contacts, and by the tension of the electrodes being kept under two-tenths of a volt by selecting suitable current density, concentration of lye and distance between the electrodes, and by adding flowers of sulphur as depolariser to the bath each time before it is newly charged with anodes, for the purpose of obtaining metallic bright, closely compact, tin deposits of perfect metallic character.

A New Recuperating Filter. M. Lamort, 18, Rue de Mogador, Paris. British Patent, 11,925. May 22, 1907.

The inventor claims: (1.) In a filtering apparatus, particularly for recuperating the fibres in the manufacture of paper, and wherein a liquid charged with solid substances to be separated and recuperated is distributed over a movable endless gauze and then detached therefrom, passing the endless gauze over a device which takes off the water drops retained by capillarity on its lower surface, and imparting to the said gauze an intermittent forward movement, producing thereby a sieving action, the solid substances retained on the gauze being then detached by any suitable means, and finally collected in a suitable receptacle; (2.) A filtering apparatus as claimed in Claim (1), wherein the forward intermittent movement is imparted to the filtering gauze by a drum, actuated by a belt which is fixed at the one end to a connecting rod reciprocated continuously by a crank, and at the other end to a spring which retracts the band each time the connecting rod makes its return movement, so that the drum, and consequently the roller and the endless gauze, are taken along only during the forward movement of the connecting rod.

Improvements in or Relating to the Treatment of Sulphide Ores containing Zinc. R. W. E. McIvor, Glengall Road, Millwall, and M. Fradd, Finsbury House, Blomfield Street, London, E.C. British Patent, 19,130. August 27, 1906.

The claims of this specification are:—(1.) The process of treating sulphide ores containing zinc, which consists in subjecting the ore to a sulphating roast to convert the zinc present into a mixture of zinc sulphate and zinc oxide, treating the whole product with a solution of calcium chloride, passing sulphurous acid into the mixture, and agitating it so as to precipitate sulphate and sulphite of calcium and obtain a solution of zinc chloride from which the zinc is afterwards precipitated by lime. (2.) The process of treating sulphide ores containing zinc, which consists in subjecting the ore to a sulphating roast to convert the zinc present into a mixture of zinc sulphate and zinc oxide, treating the whole product with a solution of calcium chloride so as to dissolve the zinc sulphate, forming a solution of zinc chloride and precipitating calcium sulphate, passing sulphurous acid gas through the mixture and agitating it so as to dissolve the zinc oxide as zinc bisulphite which is converted into zinc chloride, thus precipitating calcium sulphite, removing the zinc chloride solution by filtration, and precipitating zinc oxide therefrom by lime, thus reproducing the calcium chloride.

THE CAMPHOR SITUATION.

IN view of the report of the British Consul at Foochow on the Chinese camphor industry (see p. 265 of our last issue), the following comments from the *Oil, Paint and Drug Reporter* (New York), are of interest. Our contemporary observes that the camphor situation is exciting no small concern. It was recently announced that the manufacturers of pyroxyline products, who consumed over 75% of the camphor imported to the United States, were no longer to be dependent upon the domestic refiners for their supplies, and were to be accorded the privileges of purchasing their crude camphor from the London house of Samuel and Co., who, through the Formosa house of the same firm, are the selling agents for the Monopoly Bureau of Japan. This condition was brought about after investigation by two Japanese officials, who visited the United States for this purpose, and who reported to the Japanese Government on the situation, their recommendations resulting in the changed method of distribution referred to. A recent letter from one of these officials, communicated to our New York contemporary, states that the "camphor refiners who formerly were the principal customers of the Monopoly Bureau, have of late taken advantage of the inability of the Japanese Government to produce sufficient camphor, and the weakness of celluloid manufacturers, to buy as much as they possibly can in order to meet the rapidly increasing demands for their products, and have thus been gaining unfair profit to themselves, with the result that the former customers of the monopoly camphor have now compelled celluloid manufacturers to use substitutes for camphor on one hand, and on the other stimulated chemical inventions of synthetic camphor."

The Government of Japan has been working energetically to increase the production of camphor in Japan and Formosa, but has not been able to keep pace with the world's demands. The urgent calls for the gum attracted attention to the fields of South China, and the Japanese recommended to the Foochow Government the establishment of a monopoly system there, and even sent experts and skilled workmen to that country with a view of increasing production. For a time the Chinese monopoly flourished, but after one or two years it failed under alleged improper or incompetent management. When, however, the price of camphor began to soar in the markets of America and Europe, the Chinese took up the industry again with renewed vigour, and, according to as eminent an authority as Mr. Iwai, one of the Japanese Commissioners referred to above, the estimated present out-turn in China will reach between 20,000 to 30,000 piculs, or from 2,666,000 to 4,000,000 pounds. The Japanese production is only 6,700,000 pounds, so that China is now yielding a much more liberal percentage of the world's output than has hitherto been supposed. Mr. Iwai, however, expresses the fear that the recent stiff declines may have the affect of restricting the Chinese industry later on.

The contract which the Japanese have made with Samuel and Co. specifies among other things that 32% of the world's output goes to the United States, and of this proportion 80% is to be allotted to manufacturing consumers and 20% to refiners.

The manufacturers of pyroxyline materials have no cause to complain of the turn of affairs, but the refiners consider they have a grievance, and it is more than likely that they will make every effort and bring pressure to bear on the Japanese Government to restore the previous order of things. It does not seem likely from the tone of the letters received from that country that they will succeed, but the situation will bear close watching, as some modification of the new rule might be secured. Since the new regulations have been in force, however, and the refiners' market restricted, the evidences of competition have been apparent in the course of prices, which since last March have fallen from $1.24. to 85 cents per pound. The agreement, or whatever one might call it, has been broken, one refiner has broken loose, and in the scramble for trade has come the reduction of 39 cents a pound within the last five months.

The *Oil, Paint and Drug Reporter* concludes:—"A word or two at this time in regard to the distribution of synthetic camphor may not be inopportune. Manufacturing consumers claim that while they cannot use the chemical product for all purposes, yet it supplies a want for lower-grade material, and, as such, has a reasonable market value, but that it also has been held too high. It has been the custom of the producers to hold synthetic camphor some 10 or 15 cents under the market for the natural gum, which is considered too close a margin, especially when the price for the latter is high. Consumers would, they say, be much more liberal in their purchases of synthetic if the producer, instead of following the course of the market for natural camphor, would establish a steady price, allowing to themselves a fair profit. There is, moreover, great disinclination on part of customers to take the same chances as to values with the synthetic as they are compelled to take with the natural gum."

Answers to Correspondents.

We cannot undertake to reply to correspondents through the post. Those of our readers who have addressed queries to us should look in this column for a reply.

G. L. Co.—The blocks have been returned as requested.

L. O. C.—Thanks for your suggestion, which we are considering.

W. J. K.—Many thanks for letter, with information and suggestions.

G. H. & Co.—We have communicated your address to our correspondent.

Working Manager.—You will find all information respecting tests of gas liquor in "O'Connor's Gas Engineers' Pock t Book," the publishers of which are Messrs. Crosby Lockwood and Son, 7, Stationers' Hall Court, Ludgate Hill, London.

Fire.—On Tuesday last, a serious fire broke out on the premises of Messrs. Parke, Davis and Co., manufacturing chemists, of 111, Queen Victoria-street, E.C., considerable damage resulting.

Glenboig Union Fireclay Co.—The profits for the year ended August 31 were £29,327., including £2,914. brought forward A dividend of 10% and a bonus of 2½%, free of income tax, are recommended, adding £5,000. to the depreciation fund, and £3,000. to the reserve, and carrying forward £2,577.

The Sale of Turpentine.—On Tuesday last, at Stockport, an interesting case was heard by the local magistrates, in which a Stockport chemist was summoned for selling to the prejudice of the purchaser turpentine containing 10% of the lighter fractions of petroleum. The Medical Officer of Health for the borough stated that turpentine was a B.P. drug largely prescribed for heart and lung diseases, as a stimulant, and also for other purposes, and it was essential, therefore, that the drug should be pure. In examination the witness admitted that there was a distinction between oil of turpentine and ordinary common turpentine. Mr. W. Thomson, the Public Analyst for the borough, stated that common turpentine contained a large quantity of resin, while oil of turpentine, which was extracted from the common article, was without resin. He was not aware that crude turpentine was sold in shops. If he asked for turpentine from a chemist he would expect to be served with the oil and not the crude article. The solicitor for the defence argued that the article had to be sold as a drug before there could be a conviction under the Food and Drugs Act. Common turpentine was used for commercial and domestic purposes, and in this case the turpentine was not sold as a drug, but for commercial or domestic use. The magistrates were of opinion that in this case the turpentine was not sold as a drug, and the case was therefore dismissed.

Market Reports.

THE AMERICAN CHEMICAL MARKET.

New York, Sept. 10, 1907.

(Rate of Exchange, $4.86 = £1.)

Nitrate of soda is firm, and there is none offering on spot; prices are from $2.47½. to $2.50. Sulphate of ammonia remains quiet and can be bought at $3.07½. to $3.10. for spot, and $3.05. for future delivery. Grey muriate of ammonia for galvanising is unchanged at 6c.; white electrical is dull at 5¼c. Lump sal ammoniac remains as before, at 9½c. per lb. Lump carbonate of ammonia is also unchanged, with very little doing; prices range from 7¾c. to 7⅞c. per lb. Bleaching powders are sold at $1.30. to $1.35., according to brand. Sulphate of copper is still weaker, and can be had in a small way at 6½c. per lb. White powdered arsenic is firm, at 7¾c. to 7½c. per lb. for spot, and 7¼c. per lb. for future. Red Saxony arsenic is at prices previously reported. Calcined carbonate of potash, 80-85%, is rather firm at 3¾c. Hydrated carbonate of potash is also firm, at 4¾c. Caustic potash, 75%, is unchanged at 5¼c. per lb. Chlorates of potash and soda are at prices previously reported. Bichromate of potash is firm at 8⅛c. to 8¾c. per lb. Bichromate of soda is being sold at 7¼c. to 7½c. per lb. Oxalic acid is rather weak, at $8.45. to $8.50. per 100 lbs.

TAR AND AMMONIA PRODUCTS.

Friday.

Benzols quiet, with quotations given at 8¼d. for 90's, and 9d. for 50-90's. Crude tar, 15s. 6d. to 19s. 6d. per ton Thames, 1¼d. to 1⅜d. per gallon delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 26s. 6d. to 27s., f.o.b.; Gas Company, 29s.; East Coast, 25s. 6d. to 26s.; West Coast, 25s. to 26s. Refined naphthalene, £6. 10s. to £8. 10s. Toluol, 90%, 10d. to 10½d.; pure, 1s. 2d. Carbolic acid, crude, 50%, 1s. 5½d. to 1s. 5½d.; 60%, 1s. 8d.; 75%, 1s. 11½d. to 2s.; crystals, 39-40, 5⅝d.; 34-35, 5¼d. Cresylic, 95%, 1s. 1d. to 1s. 1¼d. Anthracene, 40 to 45% A, 1¼d. to 1¾d. Pyridin, 4s. to 4s. 3d. Sulphate of ammonia steady. Nearest values are:—Beckton, October-December shipment, £12. 1s. 3d., January-April, £12. 3s. 9d.; Beckton terms, £11. 12s. 6d.; London, £11. 15s.; Hull, £11. 15s.; Liverpool, £11. 17s. 6d.; Manchester, £11. 15s.; and Leith, £12., forward £12. 2s. 6d.

Nitrate of soda, ordinary, 11s. 3d., and refined 11s. 9d.; Liverpool ordinary 11s., and refined 11s. 1½d. Cargoes off coast or due, 11s. 1½d.; ditto for prompt shipment, 11s. 7½d.

THE LONDON METAL MARKETS.

Thursday.

Copper: Standard brands, £65. 10s. to £65. 15s. cash, and £65. 15s. to £66. three months. Tin: G.M. quality, £168. 10s. to £169. cash, and £165. 15s. to £166. 5s. three months; English, £170. Lead, soft foreign, £21. 10s. prompt, £21. 7s. 6d. September, £20. 5s. November, and £19. 15s. December; English, £21. 15s. to £22. Spelter, ordinary brands, £20. 15s. to £21., ex ship; hard, £17. 10s., f.o.b. Antimony, £43. to £45.; ore, £14.; Chinese crude, £31., c.i.f. for October-December shipment. Bismuth, 6s. 6d. Quicksilver, £7. 7s. 6d.; seconds, £7. 6s. 6d. Nickel, 1s. 10d. per lb. Aluminium, £155. to £160. Wölfram, 42s. 6d. to 45s.

FERTILISER MATERIALS.

Friday.

A rather better tone prevails in the market, and prices all round are well maintained.

Interest is being displayed in the purchase of East Indian bone meal for shipment, but shippers are firmer in their ideas, and an advance on £4. 17s. 6d. per ton, nett, c.i.f. terms Liverpool, is required. On spot, quotations are £5. 5s. to £5. 10s. per ton, according to quality, ex store.

Nitrate of soda is quiet but steady, at 11s. 1½d. per cwt. for ordinary, and 11s. 4½d. per cwt. for refined quality, ex store.

There is no change to report in mineral phosphates.

Miscellaneous nitrogenous material is in good request, and any parcels offering realise full prices.

MISCELLANEOUS CHEMICAL MARKET.

Thursday.

A good steady business continues to be done in all descriptions of heavy chemicals. A fair amount of business is also in progress for delivery over the coming year, and prices all round are firm. Bleaching powder remains at £4. 5s. per ton, f.o.r. and f.o.b. Chlorates, 3½d. The position of caustic soda is firm, and price is still without change at £9. 15s. for 70%, f.o.b. Liverpool. Ammonia alkali, 58%, £4. 10s., bags, f.o.r. Soda crystals, 60s. Saltcake, in bulk, 42s. 6d. per ton, f. .r. For acetates a steady demand is maintained for all descriptions. Acetate of lime, brown, is quoted £8. 10s., and grey, 80%, £12. 10s., c.i.f. Sugar of lead is again firmer owing to advance in the metal. Sulphate of copper is somewhat less active, and quotation is rather easier at £23. per ton. Prussiates are firm and in good request, potash at 6d., and soda at 3½d. Ammonia and ammonia salts continue in good request. White powdered arsenic is in better demand, and quotations for best brands still rule from £31. to £31. 10s., Garston.

LIVERPOOL DRYSALTERIES.

THURSDAY.

Quotations for Montreal potashes and pearl ash are nominal, with nothing offering. Bark steady, with little inquiry for Baltimore. Logwood and fustic quiet at recent quotations. Castor oil inactive, with spot values given at 3¼d. for second pressure French, and 3½d. per lb. for first pressure French and good seconds Calcutta. Cutch steady, but quiet at recent values. Gambier firm but quiet, at 19s. 0d. for store lots of block September-October shipment 18s. 9d., and November December 18s. 6d. per cwt. Cubes, No. 1, 29s. to 29s. 6d.; August-September shipment, 28s.; and October-November, 27s. 10½d. Shellac quiet on spot at recent quotations. Glucose firm, with spot quotations for American liquid, 43°, given at 12s. and 11s. 0d. for October-December; chips, 80°, for shipment 9s. and 8s. 9d., c.i.f., for 70°. American powdered starch on spot, 10s. 3d., and for shipment 9s. 9d. c.i.f. Cream of tartar, 98°, foreign powder, 81s.; 95° 79s. Citric acid: English, 1s. 10¼d.; foreign, 1s. 10d. Tartaric acid: English on spot, 11d. to 11¼d; foreign, 10¼d. to 10⅝d.

LIVERPOOL OIL AND COLOUR MARKET.

THURSDAY.

OILS.—Palm oil firm and in fair demand, sales including Benin on spot at £26. 10s., and for October shipment £27., with Lagos quiet at £29. 7s. 6d. per ton on spot, both in transit. Olive oil quiet with small stocks. Linseed oil firm, at 26s. to 26s. 6d. per cwt. for Liverpool makes in export casks. Cottonseed oil steady and in fair demand, at 28s. 6d. to 29s. per cwt. Rosin steady, with a fair business passing, and quotations for arrival parcels firm. Turpentine inactive, at 39s. per cwt. for spot parcels. Petroleum quiet at 6¾d. for Russian and Roumanian, and 7¼d. to 8¼d. for American refined oils. Petroleum spirit steady, at 1s. 0½d. to 1s. 3d. per gallon for spot American.

HULL PAINT, OIL, AND COLOUR REPORT.

THURSDAY.

OILS.—Markets generally are strong excepting turpentine, but as regards linseed an easier feeling is more current, and is largely dependent upon the crop from America, all figures and reports of the Argentine crop being unreliable. Amongst the principal imports here to date, as against the same period a year ago, are:—Wheat, 3,020,713 qrs., against 3,027,510 qrs.; flour, 155,067 cwts., against 264,482 cwts.; linseed, 584,338 qrs., against 412,756 qrs.; rapeseed, 83,702 qrs., against 84,478 qrs.; cottonseed, Egyptian, 131,204 tons, against 114,922 tons, other kinds 135,653 tons, against 103,645 tons; oilcake, 19,130 tons, against 30,317 tons; hemp, 99,364 cwts., against 123,800 cwts.; olive oil, 3,554 tuns, against 3,077 tuns; tar, 7,403 barrels, against 10,403 barrels. Amongst the weekly exports are:—Margarine, 1,113 cwts.; lard, 2,039 cwts.; sugar, 28,013 cwts.; glucose, 300 cwts.; wool, 38,900 lbs.; colours, 588 packages; hides, 518 cwts. Exports:—Oil, 10,101 cwts.; colours, 3,016 packages; chemicals, 2,489 packages. Linseed oil has improved by 5s. per ton, closing firm at 24s., naked, spot; October-December, 23s.; January-April, 22s.; boiled and refined, £1. to £1. 10s. per ton extra. Exports during the week:—11 tons America, 8 Belgium, 6 Germany, 9 India, 5 Norway; total, 39 tons. Linseed, La Plata, spot 44s.; September-October, 44s. 3d., buyers; December-January, 42s.; January-February, 41s. 9d. Refined cottonseed oil firm spot, easier forward, 25s. 9d. spot and month; October, 24s. 9d.; November-April, 22s. 1½d.; casks £1., and barrels £1. 7s. 6d. per ton extra. Exports during the week:—33 tons Germany, 27 tons Holland; total 60 tons. Cottonseed firm spot, sold at £7. 13s. 9d., ex lighter, and buyers thereat; September, new seed, sold £7. 7s. 0d.; November-January, £6. 17s. 6d. Bombay parcels, September-October, £5. 19s. 6d. bid, Hull; October-November, £6. 0s. 6d.; December-January, £5. 18s. 0d.; January-February, £5. 17s. 6d. Rapeseed, November-December, Jamba, 42s. 6d. Turpentine, spot, 38s. 9d.; October-December, 39s.; January-April, 40s.; Russian, 20s. 6d.; Assyrian, £16. Rosins unchanged. Olive oil, Levant, £40.

CAKES.—Linseed cakes steady, 95° pure, £7. 10s. to £7. 15s.; Canadian, £7. 10s.; Americans, £7. 7s. 6d. Oilcakes, £6. 7s. 6d. Cotton cakes firm, best £5 5s.; Bombay, 2s. 6d. per ton dearer, £4. 2s. 6d. Rape meal, £4.

TYNE CHEMICAL REPORT.

THURSDAY.

Chemicals continue in fairly steady demand, and prices unchanged. Caustic soda in good request at £9. 15s. for 70°, and £10. 10s. per ton for 76-77°. Soda crystals, locally, firm at £3. to £3. 2s. 6d. per ton, gross weights. Bleaching powder quiet, at £5. to £5. 5s. per ton. Sulphur scarce and firm, at £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77°, £10. 10s. per ton, nett; do., 70°, £9. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30°, £4. 17s. 6d. per ton, nett; do., 30°, £5. 2s. 6d. per ton, nett; do., 40°, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62°, £8. per ton, nett; carbonate of alumina, £29. 10s. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60°, £13. per ton, nett; do., crystals, 45-48°, £12. per ton, nett; strontium hydrate crystals, 90-95°, £8. 10s. per ton, nett; do., carbonate, 90-95°, £10. 15s. per ton, nett.

COALS.—Market is if anything a shade easier, and although colliery quotations for all classes of coal are firmly held there is considerable underselling on the part of second hands. Gas and coking coals are in steady demand, but bunker coals are now more plentiful. Coke rather quieter. To-day's prices:—Best Northumbrian steam, 15s. 9d. to 16s. per ton; second qualities, 14s. 3d. to 14s. 6d. per ton; small steam coals, 10s. to 11s. per ton; unscreened coals, 13s. to 13s. 6d. per ton; best gas coals, 15s. 6d. to 16s. 6d. per ton; Durham bunker coals, 13s. 9d. to 14s. 3d. per ton; coking coals, 15s. per ton; household coals, 16s. 6d. to 17s. 6d. per ton; foundry coke, 25s. per ton; gas coke, 20s. per ton.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, THURSDAY.

There is rather more movement amongst the calico printing works, for although the supplies of cotton are still a deterrent, some urgent orders have had to be got through anyhow. As a consequence, the call upon the drysalters for pigments has increased perceptibly, and the prices of these are firm. The ordinary heavy chemicals still come in for a fair daily business, at prices well maintained. Saltcake has advanced a fraction, say 40s. to 42s. 6d. Sulphate of copper has had a further fall. Sulphate of ammonia, Leith and Glasgow deliveries, prompt business, still shows hardly any change from the level of the past few weeks. Scotch mineral oils, solid paraffins, and paraffin spirit are for the most part in good deliveries for the season at prices as lately ruling.

Chief prices current are:—Alum (in lump), £5. 5s. to £6., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 12s. 6d. to £4. 17s. 6d., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £10. 10s.; 70-72°, £9. 15s.; 60-62°, £8. 15s.; and cream, 60-62°, £8. 15s., all nett, Liverpool; chlorate of potash, 3½d., nett, Glasgow; creosote (ordinary coal-tar and blast-furnace), 2¼d. to 2½d., naked, f.a.s. Glasgow; nitrate of soda, 11s. 1½d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2⅜d. to 2½d. per lb.; paraffin wax, 120° semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¾d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating), 865°, £5. 12s. 6d. to £5. 17s. 6d.; 885°, £6. 7s. 6d. to £7. 7s. 6d.; 890-895°, £7. 2s. 6d. to £8. 2s. 6d.; prussiate of potash, 5¾d. to 5⅞d. nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 40s.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £3. to £3. 2s. 6d.; sulphate of ammonia, £12. to £12. 1s. 3d., prompt f.o.b. Leith; sulphate of copper, £25. 5s., to £25 10s., less 5% Liverpool, prompt.

LATE ADVERTISEMENTS.

CHAMPION'S VINEGAR BREWERY, CITY-ROAD, E.C.

CLEARANCE SALE of the REMAINING PLANT and MACHINERY and the MATERIALS of the BUILDINGS, by order of Messrs. Champion and Slee, Limited, who are concentrating their business at their Tower Bridge Works:—

MESSRS. FULLER, HORSEY, SONS, AND CASSELL are instructed to SELL BY AUCTION, in Lots, on the PREMISES, as above, on TUESDAY and WEDNESDAY, OCTOBER 22 and 23, at 11 o'clock precisely each day.

THE REMAINING PLANT AND MACHINERY,

including hoisting tackle, malt cleaners, elevators and conveyers, millstones, grinding mill, malt rolls, boiling copper, hot and cold liquor and under backs, 30-quarter teak mash tun, coolers, two copper refrigerators; 30 fermenting vessels, acetifying, store, and other vats, vertical heater, pumps, edge runner mill, 12 stamp battery, sifting machines and mustard plant, copper stills and pans, silver worms and tubs and acetic acid plant, filling and capsuling machines, cast and wrought-iron tanks and pans, seven cranes, crabs, etc., filter press, deep-well and steam pumps, boilers, beam engine, 13 horizontal and vertical engines, two gas engines, saw bench and band saw, two "Bliss" presses, shearing machine, shafting and gearing, belting, copper, lead and iron piping, etc.

THE BUILDING MATERIALS

consist of about 40 tons lead, about 100 tons ironwork, 600 squares slates, etc., 500 loads timber, gates, and fencing, geometrical staircases, 5,000 yards paving and pitching, two chimney shafts, about 500 rods brickwork, etc., horses, harness, vans, and rolling stock, office furniture, etc

May be viewed by orders, and catalogues, when ready, had on the premises, or of MESSRS. FULLER, HORSEY, SONS, AND CASSELL,
11, Billiter Square, London, E.C.

MANAGER or Secretary.—Gentleman, aged 30, 15 years' experience with leading chemical merchants in London and technical training as well, desires responsible position. Good knowledge of company law and secretarial experience.—Box "1,517," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

QUALIFIED Chemist, with considerable manufacturing experience, rapid technical analyst, now disengaged, desires appointment.—"1,513," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

Notices.

All communications for the *Chemical Trade Journal* should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C.

Our Registered Telegraphic Addresses are:—

"Trepex, London."

"Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central.

Manchester: 3060.

Back Numbers of the Journal.—In future all back numbers will be charged at 6d. per copy, plus postage.

CURRENT TOPICS.

TRUSTS IN THE UNITED STATES.

THE decided attitude of the United States Government towards the great American "trusts" is arousing increased interest in the problem of large combinations and their relation to industrial development, while the enormous fines inflicted on the Standard Oil Company and its subsidiary concerns have shown that the crusade against the abuse of the "trust" system is to be pressed to a definite issue.

It is, of course, inevitable that many side issues have been raised which are of no interest to English commercial men, but the development of the American Government campaign against the huge "combines" in the various branches of trade will be followed with very great general interest by English manufacturers. We in this country are not unfamiliar with the amalgamation of businesses in the form of a combination or "trust," but it is needless to add that the operations of such bodies are in no way comparable with the autocratic domination of any particular trade such as exists in the United States.

The recent declaration of President Roosevelt, defining his attitude towards the trusts, is of special interest, even to English observers. He says:—"At intervals during the past few months, appeals have been made to me not to enforce the law against certain wrongdoers of great wealth, because to do so would interfere with the business prosperity of the country, under the effects of that kind of fright which, when it is sufficiently acute, we call panic. This appeal has been made to me even by men who ordinarily behave as decent citizens. One newspaper, which itself strongly advanced this view, gave prominence to a statement by a certain man of great wealth, to the effect that the so-called financial weakness was entirely due to the admitted intention of the President to punish large moneyed interests which had transgressed the law. I do not admit that this has been the main cause of any business troubles which we have had, but it is possible that it may have been a contributory cause. If so, so far as I am concerned, it must be accepted as a disagreeable but unavoidable feature in the course of the policy which, so long as I am President, will not be changed. It would not merely be wrong but infamous to fail to do all that can be done to secure the punishment of those wrongdoers whose deeds are peculiarly reprehensible because they are not committed under the stress of want. If a man does well he has nothing to fear from this Administration; but the corrupt politician, great or small, and the private citizen who transgresses the law, be he rich or poor, shall be brought before the impartial justice of the courts."

The methods of at least one of the great American trusts have been set forth at length in these columns in past years, and our readers will be quite familiar, from the

Digitized by Google

profuse reports to be found in the daily press, with the operations of the myriad of syndicates which, so we are told, exist in every industry in the States. The immediate bearing of the present campaign by the American Government is fairly evident, but the whole question of the concentration of capital is a still more interesting problem to the manufacturer, and the development of the situation in the States will be followed with the keenest attention, as, directly or indirectly, its effect on international competition, in chemicals as in other branches of commerce, is inevitable.

THE COPPER SITUATION.

The steady decline in the price of copper has given rise to various theories as to the real position of the market, and the comments in the trade Press, and also in various daily newspapers, are worthy of note. The *Electrical Review* observes that the reduction, after a long delay, of the price of electrolytic copper was a concession on the part of the producers, leading to the conclusion that they saw no prospect of longer maintaining the high prices. "On the other hand," continues our contemporary, "we hear constantly that the consumer is short, and that the rate of consumption has not diminished. One of the principal market circulars announces that the large producers in America and Europe have been holding stocks, and have accumulated a considerable quantity, being followed in this respect by the Japanese. The position of the opening months of the year appears, therefore, to be practically reversed. Whereas, until recently, the consumer was being forced to buy at rates enhanced by the activity of speculation, he now finds himself with a declining market apparently backed by stocks which have been allowed to accumulate."

The *Financial Times* observes that the recent decline, while it has apparently induced some of the smaller purchasers to reconsider their position, has not, however, so far caused the large consumers to abandon their previous attitude. The *Boston News Bureau* states that there are no negotiations in progress between the large producers and the large consumers. The big producers are not standing together by agreement, and neither are the large consumers. The *Electrical Review* concludes, therefore, that it is easy to understand the reluctance of the unsupported consumer to disturb a market which may, and often does, on very slight excuse, jump in either direction, with the chance of being held at a high price by the action of a few influential producers. Whichever side manages to effect a fresh combination the earlier will have command of the situation. Recent indications would point to the fact that the producer has the better facilities for, at any rate, temporary co-operation than the consumer. The policy of the latter is evidently, if anything like agreement is possible, to continue buying in small quantities during the period of depressed prices, and retiring from the market at once as soon as it shows an upward tendency. Continued retention of orders, followed by sudden activity when the price is supposed to have touched bottom, will naturally be followed by a sharp rise which may once more be artificially sustained.

The *Financier and Bullionist*, in a note on the situation, observes that according to the New York papers a syndicate has been formed, largely composed of copper consumers, for the purpose of taking over the major part of the accumulation that has been congesting the market. It is reported (presumably in the American papers) that consumers themselves do not favour an excessive fall in the price of copper at present, as the result might be a serious reaction on their own lines of industry.

The New York *Financial Chronicle* points out that in spite of continued reductions in price it cannot be said that buying has ensued. "The truth is that there appears to be, for the time, absolutely no demand for copper at any price. In these circumstances, the producing interests are curtailing production, and express a determination to suspend copper mining altogether if the present curtailment does not suffice to bring about an improvement in the situation." There have been rumours of the formation of a consumers' syndicate (evidently that referred to above) to buy up surplus stocks of copper; but, with the disastrous experience which attended the attempt of the Amalgamated Copper Company to maintain prices a few years ago, and the earlier failure of the Secretan Syndicate to "corner" copper, it seems unlikely that any responsible parties will attempt to repeat the experiment.

The *Ironmonger* observes that notwithstanding the cut to £70. made last week by the Amalgamated Copper Company, the business secured by the group is very poor. This (continues the *Ironmonger*) is not at all surprising, because the immediate cause of slackness in copper is not directly connected with prices; and, this being the case, no matter how drastic the reduction, consumers in the bulk will not come in. The position of the Manufacturing Copper Works reflects the great falling off in the demand for manufactured metal. Not so long ago these works were running day and night. Now they cannot be kept going right through the week, but are adopting a five-days' run. Copper wire for electrical purposes, which is of such immense importance so far as the maintenance of the market is concerned, is almost entirely neglected. It is suggested that this continual cutting down of prices is probably a bad policy; it will not help to stimulate buying, but will add greatly to the financial troubles of the holders of metal. If the price could be steadied for three months possibly the worst of the trouble would be over, and the trade would begin to return to normal conditions.

NITRATE OF SODA.

THE official returns of September shipments are not available at the time of writing, but private advices give the total to Europe as 83,000 tons, with 150,000 tons "loading," a somewhat wide discrepancy with the mid-monthly estimates at 75,300 and 103,000 tons respectively. Ships for season's dispatch are arriving in large numbers on the West Coast, while the change in the wind is bringing some cargoes into ports of call. Last month's European deliveries were only 58,920 tons, against 63,560 tons in September, 1906, making 1,090,010 tons in the nine months, against 1,090,240 tons in the corresponding period. Stocks at ports are 132,900 tons, compared with 87,510 tons a year ago, Hamburg, Antwerp and Dunkirk being all congested, while Rotterdam has passed its recent heavy imports up the Rhine. Liverpool has added another large cargo to its heavy stocks, yet the price there has been nominally raised 3d. per cwt. A feeble attempt made last week in Hamburg to follow suit was quickly abandoned, and business in all directions is extremely slow. Importers, having paid high prices, will naturally do their utmost to support the market, the course of which during the next few months will depend on the measure of success in the artificial restriction of shipments from Chili. In the meantime, consumers of nitrate of soda are content to await developments, and forward commitments have never been on so small a scale.

Potash Salts.—Some mystery seems to surround the potash position in Germany. On the one hand, as mentioned in our last week's issue, deliveries are reported to have recently been on an abnormally large scale; on the other hand, the syndicate has considered it necessary to issue a circular requesting the members to hasten the execution of contracts.

THE ENGINEERING AND MACHINERY EXHIBITION AT OLYMPIA.

THE second Engineering Exhibition at Olympia contains many exhibits which, although not of direct interest to the chemical trade, will still amply repay a visit of inspection. We hope to give a fairly complete description of some of the appliances of special interest to our readers in subsequent issues, but meantime we may mention a few interesting pieces of plant and apparatus.

The Pulsometer Engineering Co., Ltd., of Reading and London, have one of the most striking stands in the Exhibition—perhaps the most striking for its size. They show one of their No. 12 patent Pulsometer steam pumps which, although only 10 ft. 6 in. high, is capable of throwing the enormous quantity of 150,000 gallons per hour. In order to emphasise the great range of pumps made by the company two No. 1 Pulsometer pumps are arranged in close proximity to the No. 12. These little pumps, which are only 17 in. high, have an output of 1,000 gallons per hour. Every size of pump, from the largest to the smallest, will work suspended on a chain, and, requiring no fixing, can be put to work in the minimum of time. The Pulsometer Engineering Company have increased the height to which these pumps will deliver, and are now selling them to work on 150 feet vertical in single lifts. As two or more pumps can be placed in series, the range of lift reached by the "Pulsometer" is now very great.

Messrs. W. H. Bailey and Co., Ltd., of Salford, Manchester, exhibit a large variety of their specialities, consisting of air compressors, steam pumping engines for boiler feeding and general purposes, and boiler mountings and engine fittings of almost every description.

The "Köster" patent air compressor, of which two or three types are shown, is a machine which gives the highest volumetric and mechanical efficiencies. It has a mechanically operated piston valve for admitting air to the cylinders, and only one outlet valve, the action of which is controlled by the piston valve, so that it is allowed to open wide, and to seat itself noiselessly. Opening wide, it can be made small in diameter, leaving the whole of the cover of the cylinder and a great part of the cylinder jacket available for cooling. The wide opening of the valves enables the compressor to be run at high speeds, making it particularly suitable for being driven by the most economical type of steam or gas engine, or by electro motor. These compressors are made on the single and the multiple-stage combined inter-cooling systems. All parts are well proportioned, and wear and tear and the costs of upkeep are reduced to a minimum.

Another of Messrs. Bailey's exhibits to which attention may be called is the "Davidson" direct-acting steam pump. The feature of this pump is the range of speeds at which it can be driven, *viz.*, from 1 or 2 strokes to 200 or 300 strokes per minute. It is made with either pistons or rams for high-pressure boiler feeding, for working hydraulic presses, and for very high lifts in mines, and can be fitted with simple, compound, or triple-expansion steam cylinders.

The "Key-Ring" renewable valve seat, which is fitted in stop valves for high-pressure superheated steam, is also of interest. This valve seat allows for differences of expansion between the seat and the body, and can be easily removed and replaced. The principle of the "Key-Ring" is the adoption of a flexible metallic connection between the seat and the body, similar in construction to the well-known Ramsbottom piston ring. The seat of the ordinary type is screwed into a spring ring, which is sprung into a groove in the valve body. The seat can be removed and replaced with ease, it will expand freely in all directions, and will remain tight under all pressures and temperatures.

As showing the large range of goods made by this firm we may call attention to the Thurston patent recording oil-tester, and Bailey's patent hydraulic installation recorder. The former machine is designed for users of large quantities of oil, to enable tests to be made to demonstrate the most suitable oil for certain work. Many conditions have to be carefully taken into consideration in selecting oil for different kinds of work, and by the aid of this machine the necessary qualities can be found. The apparatus records on a diagram the behaviour of the oil during the test. The other exhibit referred to—the hydraulic installation recorder—is an instrument specially designed for use in connection with hydraulic power stations. It can be connected to any number of pumping engines, and records on a diagram the duties of these engines by giving a puncture for every 100 revolutions, and from this diagram the quantity of water delivered can be calculated. The recorder shown has been specially made for the new hydraulic power station at Falcon's Wharf, London.

Of valves for controlling steam, air or water, many interesting types are exhibited by Messrs. Bailey and Co. The "Foster" reducing valve is a spring-controlled valve which will open from any degree to full bore, according to the demand made upon it. This is accomplished by means of its differential spring arrangement, which maintains a constant pressure on the governing diaphragm, irrespective of the degree of compression of the spring. A passing reference may be made to the innumerable patterns of lubricators, steam gauges, water gauges for boilers, and other fittings shown by this well-known firm.

CEYLON TRADE IN 1906.

The total imports into Ceylon during 1906 were valued at Rs.112,789,269, as against Rs.108,325,000 in 1905; and the exports were valued at Rs.109,700,000 as against Rs.102,175,000 the previous year. Of the imports during 1906, the value from the United Kingdom was Rs.29,600,000; from British Colonies Rs.70,050,000, and from foreign countries Rs.12,525,000, whilst the exports to the United Kingdom were Rs.53,450,000, to the British Colonies Rs.20,525,000, and to foreign countries Rs.35,725,000. Among the imports were:—Chemical, dyeing and tanning materials valued at Rs.92,845. Raw manures, bone, fish, guano and others valued Rs.756,163. Sulphuric and other acids, Rs.27,059. Fuller's earth, Rs.46,626. Sulphate of Ammonia, Rs.68,852. Nitrate of potash, Rs.83,936. Sulphate of potash, Rs.127,568. Muriate of potash, Rs.25,860. Kainit, Rs.9,570. Basic, slag Rs.58,475. Superphosphate, Rs.52,765. Blood meal, Rs.84,639. Colours and paints, Rs.173,253. Perfumery, Rs.141,970. Soap, Rs.423,670.

Of the fertilisers imported, the United Kingdom and the colonies supplied Rs.2,075,000, and foreign countries (principally Germany and Belgium) Rs.709,000. The match trade has been in the hands of Germany, Japan, Austria, and Sweden to the value of Rs.207,180. Of perfumery and soap, Germany supplied Rs.51,168 and Rs.25,445 respectively, and France Rs.12,978 and Rs.1,237. Foreign nations are imitating the well-known brands of English makers, in the name, get-up of package, colour of label, etc. As regards exports from Ceylon, plumbago represented 701,845 cwts., valued at Rs.10,457,490. America, the United Kingdom, Germany, and Belgium being the principal buyers. Cocoanut oil represented 539,002 cwts., valued at Rs.9,545,725, and Citronella oil, 1,213,746 lbs., value Rs.1,204,764.

Note.—In Ceylon, 100 cents equal a rupee, which equals 1s. 4d.

THE REVENUE RETURNS.—The revenue returns for the past half-year show an increase of £883,490., as compared with the corresponding period of last year. A decrease was estimated in property and income tax of over a million sterling during the year, but so far there is an increase of £463,000. The second quarter of the financial year shows a net increase of £213,551.

BUSINESS CHANGES.—We are informed that the old-established firm of Hugh Wallace and Co., Ltd., have gone into voluntary liquidation and will shortly cease business. Under these circumstances, Mr. William T. Bruce, who has been with the firm for some 33 years, has decided to commence business on his own account, trading as W. T. Bruce and Co., 1, Lombard Court, E.C.

THE NEW AMMONIA-SODA WORKS AT PLUMBLEY.—An announcement was made some time ago respecting the discovery of a new salt-producing area at Plumbley, near Northwich, on land owned by Mr. J. H. Davies, of Manchester. Extensive examination and boring have proved that the brine supply is abundant, and we understand that the land has been sold to the Ammonia-Soda Company, with which firm are associated Mr. Arthur Chamberlain, Mr. A. Chamberlain, Jr., Mr. Ivan Levinstein, Mr. J. S. Nettlefold, Mr. A. T. Cocking, and others. The Ammonia-Soda Company are now proceeding with the erection of a large chemical works at Plumbley, and it is stated that the boring operations have proved even more successful than was anticipated. A large brine shaft has already been completed, and it is further stated that the works are expected to commence production in about twelve months from the present time.

COALITE.

THE claims of the specification covering the "Coalite" process are now published in the United States *Patent Journal*, and are as follows:—865,724. Fuel. Thomas Parker, London, England. Filed January 26, 1907. Serial No. 354,319. (1) The herein described process for the production of fuel from coal which consists in subjecting the coal in a closed retort to a comparatively low gas evolving temperature, maintaining it at this temperature while illuminating gas continues to be evolved, and cooling when illuminating gas ceases to be evolved and when the mass is substantially free of tarry components, so that the product shall be hard, of uniform character, homogeneous, and capable of withstanding stacking, handling, and carriage without further treatment.

(2) The herein described process for the production of fuel from coal which consists in subjecting the coal in a closed retort to a temperature of about 800° F., maintaining it at about this temperature while illuminating gas continues to be evolved, and then cooling and removing the fuel from the retort.

(3) The herein described process for the production of fuel from coal which consists in subjecting it in a closed retort under moderate pressure to a temperature of about 800° F., maintaining it at this temperature while illuminating gas continues to be evolved, and cooling and withdrawing the fuel when illuminating gas ceases to be evolved.

(4) The herein described process for the production of fuel from coal which consists in subjecting the coal in a closed retort to a temperature of about 800° F., maintaining it at about this temperature while illuminating gas continues to be evolved, and then suddenly arresting the heat by introduction of steam and removing the fuel from the retort.

Commenting on the flotation of British Coalite, Ltd., the *Investors' Guardian* observes that the flotation has been the subject of much discussion and comment in financial circles and of no little criticism in the Press. In these circumstances the address of the chairman of the company, Mr. A. G. Kitching, at the statutory meeting, is worthy of some consideration. Our financial contemporary says:—"The affairs of the company have been criticised on a number of different points, but Mr. Kitching had some reply to make to all the objections that had been raised on important matters. He pointed out in the first place that the directors were financially interested in the business like the shareholders, and that they believed it would be a commercial success. That it is an investment of a speculative character Mr. Kitching did not deny. The conditions of purchase from the inventor, Mr. Parker, he regards as honourable, fair, and reasonable, and he pointed out that Mr. Parker does not receive a farthing until the ordinary shareholders have received 6%. The contract with William Cory and Son, Ltd., was also defended as one of mutual advantage to both companies, and it was spoken of as a valuable asset to British Coalite, Ltd.

"'The company offered for subscription a million and a half ordinary shares of £1., and 750,000 ordinary shares were underwritten. The amount subscribed was £750,182. The underwriters had to take up some of the shares, and have already paid a very large sum in respect of those shares. There are about 3,500 shareholders on the list, and considering the condition of the money market when the prospectus was issued, and the strong attack made upon them by a 'large and influential interest' who feared the competition of British Coalite, Ltd., the chairman declared that it was a marvel to him that the shares were taken up to such an extent as they were. As only half the capital offered was subscribed the company cannot make the profits which were anticipated on a capital of £1,500,000.

"On the much discussed question of the patents Mr. Kitching was able to make a reassuring statement. The Official English Patent Office Examiner has not found a single patent that anticipated the invention, and the application for the English patent has been taken through every stage up to its publication, but acting under the advice of eminent counsel, the board has deferred the publication of the patent to the date allowed by the Patent Office. The most exhaustive searches have been made, and the board's advisers are able to give an absolute assurance that the English patent will be granted as a matter of course, 'no matter what opposition may be raised by interested parties against the grant.' As to the contention that the patent will be invalid and ineffective, all Mr. Kitching could do was to quote the opinion of experts and counsel to the contrary and to express his own opinion, for it is a matter which the future must prove. What Mr. Kitching could and did tell the shareholders was that in the United States, where the conditions are much more stringent than with us, the full patent had been granted and sealed, and that in Germany the patent had been allowed—that is not an absolutely full patent, the position in Germany being much the same as it is here.

"A considerable number of the stills in which coalite is manufactured are to be delivered at Barking almost immediately, and it is anticipated that the first unit will be ready for work by the end of November. As to the purchase price of the land at Barking, which has given rise to much comment, Mr. Kitching said the land was valued by Messrs. Fuller, Horsey, Sons and Cassell, and their estimate was that it was worth more than the company gave for it. The purchase price of the land at Wednesfield has also been the subject of criticism, because of the profit made by the Wednesfield Construction Company, Ltd., but an experienced colliery engineer has now advised the company that of the sixty acres forty can be worked for coal, and the principal Staffordshire thick seams lie immediately adjacent to the surface, and the coal can be easily worked. The land is estimated to yield over a million tons of coal.

"Lastly, Mr. Kitching has something to say of the merits of coalite, which is a hard, dense and smokeless fuel, and is not coke. Coke is difficult to ignite, requires a strong draught to keep it burning, and is not suitable for domestic grates. Coalite ignites easily and burns freely. It can be lighted and burnt under the same conditions as ordinary coal, and is absolutely smokeless. The profession of the chimney sweep is to be unknown with the use of coalite. Mr. Parker is endeavouring to cheapen and expedite the manufacture of coalite, and another piece of good news which Mr. Kitching had for the shareholders was that an important gas company had been in communication with the company with a view to erecting coalite plant close to its works, that they may purchase the gas from British Coalite, Ltd., at an agreed price, the Coalite Company to deal with the coalite and other bye-products."

The *Manchester Guardian* of Wednesday last published the following letter from a Manchester firm:—"We notice in your issue of this morning a description of the process by which it is proposed to produce coalite. We should be glad if any of your readers could inform us wherein lies the difference between the process described and that pursued by every gasworks in the country, the resulting residuum being hitherto called 'coke.' If it is answered that coalite is to be removed from the retort slightly earlier than is usually the case in gasworks, surely there is nothing to prevent these already-instituted works from emptying their retorts a little earlier or later, as they may think fit, should it be deemed desirable in order to satisfy any wants of their customers. Hitherto coke, a good saleable material, has been the residuum. Now it would appear, in the case of coalite, that gas is to be the residuum. How is this to be disposed of? Are we to have a competitor to our municipal undertakings? Such a thing is of course out of the question, so that the price obtained for the material itself, 'coalite'—that is, coal treated by the process mentioned—will have to bear almost the whole cost of its manufacture. How dear it would be under such circumstances we may easily imagine. We should be extremely glad if any of your readers would favour us with more light on the points we have mentioned."

Obituary.—The death is announced of *Mr. F. J. M. Page, B.Sc., A.R.S.M.* Mr. Page was an original member of the Society of Chemical Industry. He was formerly Lecturer in Chemistry and Physics at the London Hospital Medical College, and later became examiner in Chemistry and Physics to the Society of Apothecaries. He was joint author with Dr. A. P. Luff of a "Manual of Chemistry, Inorganic and Organic," which has passed through three editions. He was also the author of a work on elementary physics. Mr. Page was in his sixtieth year.

Increased Consumption of Mineral Manures in Russia.—On the occasion of the Congress of Zemstvos in Moscow, a report is being prepared on the disposition of the peasants towards mineral manures. Trials have been made by the Moscow Zemstvo in 803 peasants' lands. Many at first gave the idea a poor reception, but the satisfactory results have effected a revolution in the views of the peasants, who are now clamouring to have all the peasants' fields dressed with such a "miracle working powder," which has been found to work wonders; also on the fields where spring wheat was sown, because the wet weather had spoiled the chance for the winter-sown grain. As a consequence, the number of centres for the sale of mineral manure is to be largely increased for the coming season.

Our Book Shelf.

THE CHEMICAL TRADE DIRECTORY OF CHEMICAL MANUFACTURERS, MERCHANTS, BROKERS AND AGENTS, AND MAKERS OF CHEMICAL PLANT IN GREAT BRITAIN AND IRELAND. Third Edition. Pp. 336. London: Davis Bros., 265, Strand, W.C. 1907. 10s.

The third edition of the Chemical Trade Directory, although reduced in price by one-half, has lost nothing in usefulness. The handier form of production will commend itself to those who have occasion to use it frequently, while the addition of about 250 new names shows that its comprehensiveness has been increased. The Directory has been completely revised, and the work has been compressed in such form as to give greater information in less space than in the two former issues.

The classified lists forming the first part of the volume have been entirely re-cast, and in this classification the true alphabetical system has been adopted. The makers of Hydrochloric Acid, Muriatic Acid, and Spirits of Salt, for instance, are all classed as "Acid, Muriatic," with references to the cross-headings for the trade terms. Makers of Vitriol, again, will be found under the heading "Acid, Sulphuric," with a cross reference to the trade name for the article. In metallic and other salts the basic constituent is adopted as the key to classification—Sulphate of Copper, for example, being classified as Copper Sulphate; Sulphate of Quinine as Quinine Sulphate, etc. Acids are placed under the general heading, "Acids," with a sub-alphabetical position, easily found on reference. Compounds sold under a general trade name, such as Glauber's Salt, Sal Prunella, etc., will be found classified under their trade terms.

The list of Public Analysts has been omitted from this edition of the Directory, as the Institute of Chemistry now issue an official list, to which inquirers are referred.

The number of questions addressed to this *Journal* as to any particular class of chemical products, apparatus, or machinery is so large, and our acquaintance with the makers of such articles is also so intimate, that in introducing the third edition of the Directory to our readers we hope to present them with a reply to all such inquiries as may arise in the conduct of their business. While not claiming to have prepared a volume which is free from errors or omissions, we think that those for whose use it is intended will find the book in its new form not only a cheaper reference work, but also more comprehensive and more systematically arranged.

INDUSTRIAL ALCOHOL: ITS MANUFACTURE AND USES. By J. K. Brachvogel, M.E., with special chapters by C. J. Thatcher, Ph.D. Pp. 516. London: Crosby Lockwood and Son. New York: Munn and Company. 1907.

The new provisions respecting the use of alcohol for industrial purposes, and the amended excise regulations established by the Revenue Act of 1906, were the outcome of investigations made by a Departmental Committee appointed in 1905 by the then Chancellor of the Exchequer (Mr. Austen Chamberlain). The report of that Committee included a very careful summary of the bearing of this problem of cheap alcohol on the development of the anilin dye industry, and in view of the importance of the whole subject to the chemical trade the present volume is of special interest.

The work is based on Dr. Maercker's "Introduction to Distillation," as revised by Dr. Delbrück and Dr. Lange. The "Introduction" was designed for the use of students and practical distillers, and the present volume comprises practically the entire text of Dr. Maercker's "Introduction," but so extended, revised, and enlarged that Mr. Brachvogel's book constitutes an intermediate work between the "Introduction" and the "Handbook" of Dr. Maercker.

As pointed out by Mr. Brachvogel in his preface, the principal European source of industrial alcohol is the potato. Up to the present year this vegetable has not yet come into general utilisation for this purpose in the United States, where the sources of spirit are the various grains and certain saccharifierous raw materials such as the sugar beet and molasses. The volume, therefore, deals almost exclusively with the manufacture of spirit from potatoes and grain, the other raw materials being touched in a brief manner only.

The principle of the natural pure yeast culture has been developed mainly in Germany, where the science of fermentation has attained a remarkably high level, Dr. Delbrück, who is one of the foremost German fermentologists, having been closely identified with the development of the process. The treatise accordingly deals with this subject as thoroughly as possible, the best German practice being set forth in detail.

The introduction to the volume is devoted to a consideration of the industrial value of tax-free alcohol and its importance to American agricultural interests, together with a summary of the processes used in spirit manufacture. Part I. describes the formation and characteristics of starch, and the changes which it undergoes in manufacture. Part II. deals with the enzymes or ferments; Part III. with the products of fermentation; Part IV. with the farinaceous raw materials used in spirit manufacture (the potato, barley, rye, corn or maize, oats, wheat, rice, etc.); Part V. with the preparation of the malt, including a description of the washing machines, steeping vats, the arrangement of the malt house, etc. Part VI. describes the working of potatoes, with descriptions of the various types of steaming apparatus. Then follow Part VII., on washing processes and apparatus; VIII., fermenting the mash; IX., the preparation of artificial yeast in the distillery; X., fermentation in practice; XI., distillation and rectification; XII., the arrangement of the distillery; XIII., the spent wash; XIV., the denaturing of alcohol; XV., alcohol for the production of power; XVI., heating with alcohol; XVII., illumination with alcohol; and XVIII., statistics of alcohol production (covering the United States, Great Britain, Germany, France, and Belgium). An Appendix of 83 pages contains specifications for methyl alcohol and benzine submitted for approval as denaturing materials, and also information as to the regulations and instructions relating to denatured alcohol in the United States.

The work cannot fail to be of the greatest use to the practical distiller, dealing, as it does, in a comprehensive manner with the best German practice. The printing is clear, and the illustrations are well reproduced; while the importance of the subject will make the book specially interesting to the chemical manufacturer who requires cheap alcohol for his operations.

PRICE LIST OF ORGANIC AND INORGANIC CHEMICALS. Harrington Bros., Ltd., Cork.

SYLLABUS OF CLASSES AT THE SIR JOHN CASS TECHNICAL INSTITUTE, SESSION 1907-1908. Pp. 118. Issued from the Institute, Jewry-street, Aldgate, London, E.C.

SOCIETY OF CHEMICAL INDUSTRY: *Liverpool Section*.—The Hon. Secretary announces that the October meeting of the present Session will not be held.

TECHNICAL COLLEGE FOR ABERDEEN.—It is announced that Mr. Andrew Carnegie has given £10,000. towards the establishment of a technical college in Aberdeen.

CHANGE OF ADDRESS.—Messrs. Higginbottom and Co. inform us that their business, which has been carried on at 116, Portland-street, Manchester, for the past 28 years, will in future be conducted from their new offices, 21, Spring Gardens, Manchester.

EXPLOSION AT A TAR DISTILLERY.—An explosion occurred last week at the works of Messrs. Josiah Hardman and Co., Ltd., Nechells, Birmingham, while workmen were transferring tar from a still to the cooling chamber. The end of the still was blown out, but fortunately little damage resulted.

THE INCOME TAX.—It is announced that income tax payers who have failed to comply with the requirement as to forwarding declarations in time to be received on Saturday last, may obtain from the Collectors a special white form, for the purpose of declaring in brief that their income will not exceed £2,000., and that the whole or part of such income is earned. If this form is used, the signatory must undertake to make the necessary return of his income from all sources when called upon to do so.

Analytical Notes.

THE MAHLER-COOK CALORIMETRIC BOMB.

The Berthelot-Mahler bomb, in which the fuel is burnt in oxygen gas at 20 to 25 atmospheres pressure, is now generally recognised to be the only reliable apparatus for accurate measurements of the heat of combustion. The practice of testing the calorific value of fuels is rapidly extending, and it is becoming quite general, in placing fuel contracts, to specify that the coal shall have a specific minimum calorific value, in British thermal units, as measured in the Berthelot-Mahler calorimeter. Such tests are also carried out regularly in many works and power stations, to check and control the fuel supply. The chief difficulty which has prevented the more general adoption of these methods has been in procuring the necessary apparatus. With the advice of members of the staff of the Manchester University, Mr. Chas. W. Cook, of the University Engineering Works, Coupland-street, Manchester, for some time past has been constructing an improved type of bomb calorimeter which has already been adopted by a number of engineers, laboratories, and works. The complete apparatus is illustrated below, but a short account may be given of some of the special characteristics of the bomb.

The combustion vessel, of some 650 c.c. capacity, is constructed of mild open-hearth steel, its thickness and shape being carefully designed to ensure a high limit of safety. With the same object in view, the bomb is tested to over 200 atmospheres (3,000 lbs. per square inch), a matter of considerable importance, since in determining the heat value of oils or other quickly burning fuels the combustion is very rapid, and unexpectedly high pressures may be attained. The inside surface is coated with a special enamel, which satisfactorily protects the steel from corrosion.

For the convenience of fitting up and dismounting the apparatus the cover is provided with a special joint, which is held down by a powerful steel hexagon nut. The valve for the admission of the oxygen is made of a special alloy, which is practically incorrodible, and is of an improved form, perfectly gas-tight, and can be easily connected to the pressure tube conveying the oxygen.

The insulated ignition plug is the result of much experiment. It is somewhat unique, gas-tight at practically any pressure, and the electrical insulation is also perfect.

The holders for the crucible which contains the material to be tested, as well as the crucible itself, are made of solid platinum.

The stirring gear and the felt-lined double-jacketed copper calorimeter vessel will be seen in the illustration. In every detail of the construction an attempt has been made to attain the highest possible standard in quality.

The carrying out of tests with such a type of calorimeter is in reality quite a simple matter, and the concordance of the results obtained is greatly superior to that possible with any of the ordinary types of apparatus.

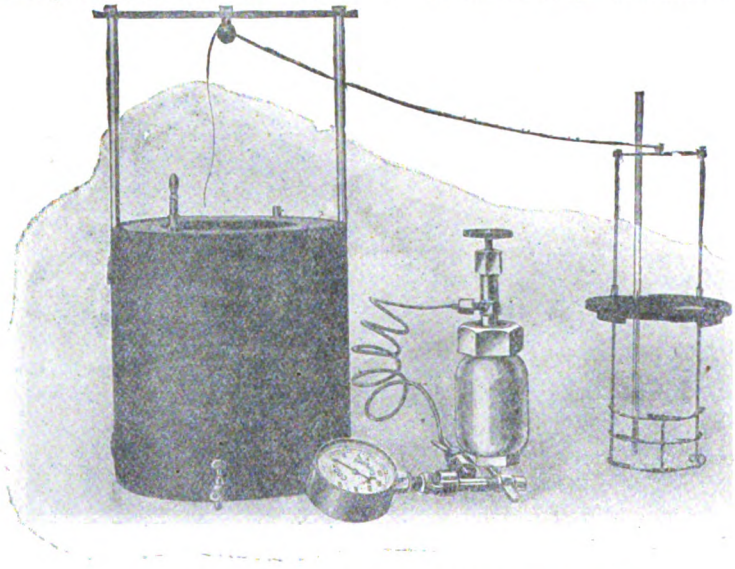

FIG 1.—THE MAHLER-COOK CALORIMETRIC BOMB.

ELECTRIC FURNACE REACTIONS UNDER HIGH GASEOUS PRESSURES.*

By R. S. Hutton and J. E. Petavel.

The paper gives an account of a detailed study of a number of electric furnace reactions. The object in view was to investigate the effect of wide variations in the physical conditions.

The experiments were carried out in an air-tight enclosure, and, by analysis and measurement of the gaseous as well as of the solid products, every reaction was followed in detail. A careful measurement of the total energy supplied to the furnace was also made, and the calculated yields per kilowatt hour are recorded in the appendix to the paper. Special attention was paid to the effect of the pressure and nature of the gaseous atmosphere in which the reaction was carried out

The principal processes studied are—the formation of calcium carbide, carborundum, and nitric acid, the direct reduction of alumina by carbon, and the fusion of quartz.

A full description is given of the two pressure furnaces in use, as also of the power plant, gas compressing plant, etc. The power employed in the case of the larger furnace was generally 10 to 15 K.W. The furnaces consist essentially of strong steel enclosures provided with the necessary valves, windows, and insulated electrode holders. Inside these pressure chambers any desired arrangement for arc or resistance heating could be mounted.

The currents used ranged up to 1,000 amperes, and special fittings were also provided for very high tensions (25,000 volts.) Working pressures up to 3,000 lbs. per square inch were frequently employed, the apparatus being also suitable for use as a vacuum furnace. The capacity of the larger enclosure was 20 litres, that of the smaller being about one-tenth of this.

Some preliminary experiments dealt with the electrical constants of carbon and metal arcs in air, hydrogen, carbonic acid, nitrogen, and coal gas, which are compared with similar values under ordinary atmospheric conditions. Tables and curves giving the relation between the E.M.F., current, and length of the arc are given. Marked differences are noticeable in the character of the discharge in neutral and oxidising atmospheres. The effect of pressure upon the rate of oxidation of heated metals is also considered.

The formation of calcium carbide is the first electric furnace reaction to be studied. A vertical smothered arc was used, the charge for each experiment amounting to about 10 kilogrammes of lime and carbon, an ingot of carbide weighing about 1 kilogramme being produced.

The experiments were carried out in an atmosphere (*a*) of carbon monoxide, (*b*) of coal gas, (*c*) of hydrogen at pressures ranging from 7 to 1,700 lbs. per square inch absolute. Among the conclusions arrived at the following may be quoted:—(1.) Contrary to the views usually held, the pressure of an atmosphere of carbon monoxide during the reaction does not appreciably decrease the yield. (2.) If the carbide is cooled in an atmosphere of carbon monoxide, a back reaction occurs at about the freezing point of the substance. The effect is, however, limited to the surface of the ingot, and when working on a large scale this does not seriously alter the weight of product obtained.

The fusion of quartz under pressure was next undertaken; the experiments were carried out in air and in hydrogen at pressures up to 2,500 lbs. per square inch; they showed *inter alia* a marked decrease in the vaporisation of the fused product, but no appreciable increase in its fluidity and transparency.

It is generally accepted that carborundum results from interaction of silica vapour and carbon. The diminished vaporisation of silica, noted above, accounts for the very limited formation of carborundum which occurs under pressure; the proportion of the amorphous variety was also much lower than is usually the case.

The difficult problem of the direct reduction of alumina by carbon resulted in a lengthy and detailed research. Briefly stated, the conclusions arrived at are:—(1.) That metallic aluminium can be produced by a purely thermal reaction. (2.) That the lowest temperature at which this reaction can take place coincides with the melting point of alumina. (3.) That the metal is first produced in the form of vapour. Under ordinary conditions, however, carburisation immediately occurs

* Abstract of a paper read before the Royal Society. Communicated by Professor A. Schuster, F.R.S.

Digitized by Google

by the interaction of the metal vapour with the carbon monoxide. To collect the pure metal, two precautions are found to be necessary: (1.) The carbon monoxide must be diluted and removed. (2.) The vaporisation of the metal must be limited by operation under high gaseous pressures.

In certain experiments quoted, a small quantity of aluminium (40-50 grammes) was collected, and the working of the process on a large scale is chiefly a matter of the arrangement and construction of the furnace.

The only gaseous reaction referred to in detail is the formation of oxides of nitrogen. Two distinct series of experiments were carried out: For the first, a high tension (25,000 volt) transformer was employed in conjunction with the smaller furnace. In the second series, a more powerful but lower tension arc discharge was spread out by a mechanical interrupter actuated by a small air turbine placed inside the larger furnace. Both series show an increase of efficiency attributable to pressure.

The paper is illustrated by some figures, and followed by an appendix giving a summary of the numerical results.

A NEW PRESSURE FILTER FOR LABORATORY USE.

While many of the filtering operations carried out on a manufacturing scale are performed under pressure, the use of filtration under pressure in laboratories is not by any means general, notwithstanding the numerous advantages of this method over filtration by vacuum, which latter is so largely employed in the laboratory. This state of things is no doubt due to the fact that the materials most frequently used for laboratory vessels, *viz.*, glass or porcelain, cannot be used for internal pressure without special precautions.

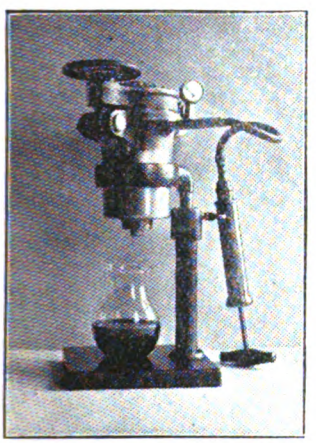

FIG. 2.—A NEW PRESSURE FILTER.

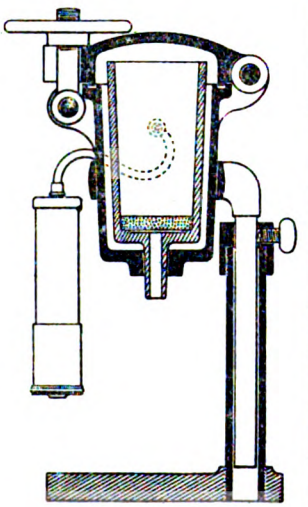

FIG. 3.—SECTION.

The use of glass or porcelain filter vessels is, however, made quite safe and convenient by the patented method of balancing the pressure as employed in the laboratory pressure filter which we illustrate in Figs. 2 and 3. As will be noticed in the section (Fig. 3,) this pressure filter consists of a small pressure vessel, mounted on an adjustable stand, and provided with a hinged cover which can be quickly closed by means of an eyebolt and screw with large hand-wheel. The filtering funnel, which may be of stoneware, porcelain, or glass, is placed in this vessel, and rests on a rubber ring (not shown in the illustration) round the outlet opening. The vessel is connected to a compressed-air main, if such is available, or the necessary pressure may be readily obtained by means of a bicycle pump. The filtering funnel is then surrounded by compressed air, and the pressure on it is practically balanced, as the bottom of the filter is provided with circular ridges supporting the filtering material, which transmits the pressure resting on the surface of the liquid. The filtering material is preferably a porous plate, such as the well-known Schuler's porous filter plates, which may be used for neutral, acid, alkaline, and corrosive liquors, even at high temperature. These filter plates are luted into the filter by some material appropriate to the liquor to be filtered, *e.g.*, a mixture of sulphur and graphite or asbestos-silicate cement for acid, and Portland cement for alkaline liquors. Where a permanent lute is not desired, the plates may simply be packed with a strand of asbestos yarn rammed in tightly.

The small filter shown in the illustration has a funnel with a capacity of about 200 c.c., and the outer vessel and cover are made of bronze. Larger filters on the same plan are made of cast iron, with stoneware funnels, having a capacity up to 1,500 c.c. and a filtering surface of about four inches diameter.

The advantages of filtering under pressure are, of course, well understood, but may be worth recapitulating here. Hot or volatile liquids may be filtered, while this is not possible with vacuum, and the same thing applies to liquors containing dissolved gases, such as sulphuretted hydrogen. Where contact with air is not admissible, inert gases, such as nitrogen or carbon dioxide, may be used. The filtered liquor is not concentrated by evaporation, as is generally the case with vacuum filtration, but retains its original specific gravity. The rate of filtration and the attainable thickness of solid matter on the filter are both much greater than with the small pressure acting on the vacuum filter.

This filter, which we think should prove a valuable piece of apparatus, both for laboratory work proper and for ascertaining the necessary filtering surface and the best working conditions for work on a manufacturing scale, is supplied by Messrs. S. Bornett and Co., Ltd., 19, St. Dunstan's Hill, London, E.C.

CHEMICALS IN CHINA.

TENG YUEH.

THE following table shows the total trade reported at the custom house at Teng Yueh and its branch offices for the last four years:—

Year.	Exchange. s.	d.	Value. Currency. Haikwan taels.	Value. Sterling. £
1906 ..	3	3½	1,397,877	230,067
1905 ..	3	0 1/13	1,679,999	258,461
1904 ..	2	10½	2,085,504	299,791
1903 ..	2	7½	1,715,653	225,179

The total trade for the year 1906, £230,067., is less by £28,394. than that reported in the previous year. The decrease represents the difference between a diminished import of £36,390. and an increased export of £7,996.

Of the total import of £185,643., goods to the value of £131,254. were sent inland under transit pass during the year, leaving a value of £54,389. to be accounted for in the neighbourhood of Teng Yueh. The distribution of the decrease in imports in 1906 was £14,357. in the transit trade and £22,033. in local consumption.

The local mining industries show increased exports for 1906. Mines exist in the province, but mining is not much encouraged, and, even if it were, the want of communication would prevent its development.

Orpiment does not come from Menghua itself, but from a place called Shih huang ch'ang on the borders of the Menghua and T'ai ho (Tali) districts, about 24 miles from Hsia kuan.

The following were amongst the articles imported into Teng Yueh during 1906-05:—

		1906. Quantity.	1906. Value.	1905. Quantity.	1905. Value.
Japanese matches	..gross,	43,725	£3,337	15,017	£1,028
American kerosene	..gallons,	68,735	£4,553	36,855	£2,326

The chief export article was:—

Orpiment	..lbs.	800,400	£6,026*	468,400	3,357*

* Approximately.

FOOCHOW.

The gross trade of Foochow for 1906 shows an increase of £222,271. The appreciated volume here recorded is only apparent when the figures are turned into sterling. If the calculation be made in Haikwan taels there is, on the contrary, a decrease of 418,911 taels. Similarly, when comparing the net values, the apparent increase of £123,148. in 1906 becomes a decrease of 753,552 taels. These discrepancies are due to the rise of the rate of exchange for the Haikwan tael from 3s. 0 1/16d. in 1905 to 3s. 3½d. in 1906. There was a decline in imports, both foreign and native, amounting to £118,893. in the one, and to £40,955. in the other. In exports, however, those to foreign countries increased by £266,341. and those to Chinese ports by £6,655.

Digitized by Google

The total value of metals imported was £107,113., a decrease of £22,740. compared with 1905. Copper (bars and slabs) contributed £49,868.; iron and mild steel (new and old), £10,768.; lead, in pigs and bars, £14,610.; and tin, in slabs, £36,028.

American kerosene increased from 868,040 gallons, valued at £19,298. in 1905, to 996,700 gallons, valued at £22,965. in 1906; Sumatra oil decreased from 2,200,500 gallons (£39,461.) to 1,679,399 gallons (£29,207.). Borneo oil was imported to the amount of 200,000 gallons (£3,357.). Of the Sumatra oil, 462,121 gallons were imported in bulk; all other oils were imported in tins. The Asiatic Petroleum Company is the only firm here having tank installations. The Standard Oil Company purpose erecting three tanks at Pagoda Anchorage with a combined capacity of over 2,000,000 gallons.

The total exports direct to foreign countries, including Hong Kong, show an increase of £266,341. over the 1905 total, while the exports to Chinese ports remain practically the same, being £787,755. as compared with £781,100.

Oils of all kinds (bean, camphor, etc.) advanced from £3,660. in 1905 to £18,161. in 1906.

The principal articles of import into Foochow during 1905 and 1906 were :—

	Quantity.			Increase or decrease in 1906, corresponding with	
	Average 1901 to 1905.	1905.	1906.	1905.	Average 5 years.

Kerosene Oil ....gals.	3,165,211 ..	3,099,690 ..	2,875,399	− 191,291 ..	− 289,812
Article of export :—					
Camphor .....cwts.	1,574 ..	4,505 ..	13,535	+ 8,730 ..	+ 11,961

SHASI.

The trade of Shasi in 1906 presents no features of interest to British merchants or manufacturers. The net value of the imports and exports was £246,403., the former amounting to £158,338. and the latter to £88,065., a considerable advance on the figures for the previous year.

The two principal articles of native produce exported from Shasi during 1902-06 were :—

	Cwts.				
	1902	1903	1904.	1905.	1906
Oil, wood ..	3,890	1,453	..	125	1,222
Tallow, vegetable..	6,496	12,912	5,999	2,993	9,819

TIENTSIN.

During 1906 the net trade of the port of Tientsin was :—Imports, £14,983,542.; exports, £3,592,082.; total, £18,575,624. In 1905 the figures were as follows :—Imports, £12,308,041.; exports, £2,217,045.; total, £14,525,086.

Copper ingots and slabs fell from £411,720. in 1905 to £104,028. in 1906. The mints in Tientsin, however, still turn out hundreds of thousands of copper pieces, no silver coins being, so far, regularly minted.

Aniline dyes and artificial indigo show an increase, their values for 1905 being £84,672. and £65,072. respectively, compared with £108,229. and £141,258. in 1906. Japanese matches have fallen off by 3,123,504 gross, and £62,002. in value.

Kerosene from America amounted to 6,832,190 gallons in 1905, but owing to the boycott and the subsequent disfavour of American merchandise this total fell to 5,067,599 gallons in 1906. An article so necessary to the Chinese now-a-days could not be completely boycotted, but much damage was done to the trade, and preference was given to kerosenes of other origin. The latter being, however, of inferior quality, could not entirely supplant the American oil. Russian oil, owing to the troubles in the Transcaucasian provinces, ceased to come altogether, and the void was filled by the two Asiatic products from Sumatra and Borneo. The former (chiefly Langkat) has increased with extraordinary rapidity, the import in 1905 being 6,820,927 gallons (£138,237.) and via Chinwangtao 626,770 gallons, making a total of 7,447,697 gallons, which rose in 1906 to 12,422,579 gallons (£194,906.). Borneo oil has also advanced, the import in 1905 being only 100,000 gallons (£2,522.). In 1906 it leapt up to 1,973,824 gallons (£27,238.).

In former years almost the whole import was in cases, but during 1906 the deliveries in this form have fallen very rapidly, and the oil has been shipped largely in bulk.

The principal articles of net import during 1906-05 were :—

	1906.		1905

The recovering of debts claimed to be due by Chinese subjects to British merchants is a constant source of worry and friction to the consular authorities. The delays experienced by the usual treaty part procedure, even when the facts are simple, are often very great. The British Consul at Tientsin has, owing to this state of things, had recourse to a system of preliminary investigation of claims before sending them to the native courts. The Chinese defendant is requested to attend at the Consulate, and, in this way, the case often assumes a different aspect, and the presentation of the claim to the Chinese is modified accordingly. The Chinese authorities are asked to fix a date for the hearing, when a British plaintiff may attend to give evidence, and a member of the Consulate staff be present to watch. This method is open, however, to objection in that it throws on the Consulate work which ought to fall on the investigating tribunal.

"The true remedy for this embarrassment," says the Tientsin Consul, "is without doubt in the institution of a special court for the trial of mixed civil suits. A court which should be—not a mixed court of the Shanghai type, which is not desirable to multiply, but a tribunal for the hearing of mixed cases—and especially mixed civil cases. Such a court should be presided over by a specially selected, well-paid, well-reputed, capable Chinese official, administering Chinese law according to principles and procedure which he understands, embodied in some not too elaborate set of rules for the conduct of his court. Even so, there would doubtless be many disappointments for foreign plaintiffs, especially where a case involved questions not only of fact, but difficult points of commercial law, which it is unlikely would be appreciated and treated as in a court of his own country. But the British merchant out here is not as a rule unreasonable, and knows that enterritoriality does not extend to bringing Chinese defendants into foreign court. I think it is quite probable that next year's trade report may have progress to record on this far from unimportant subject."

Continental Notes.

THE annual meeting of the Society of German Naturalists and Physicians was held from September 15 to 21, at Dresden, and reports of many of the papers read are given in the *Chemiker Zeitung* for the 18th and 21st. Before the Botanical Section, Dr. Hans Molisch read a series of three papers dealing with microscopy and ultra-microscopy. In one of these he discussed the probability of the existence of micro-organisms too small to be seen in the ordinary microscope, and he comes to the conclusion, on various grounds, that there are few, if any, such very minute bacteria. Colonies of bacteria are always resolvable by powerful modern microscopes, although, in some cases, the individual micro-organisms appear only as points. Organisms that are observed by the ultra-microscope can also always be seen in the field of the microscope. In those cases where plants suffer from diseases for which no bacteria can be detected, as the mosaic disease of tobacco, it is probable that the disease is not due to a bacterium, but to chemical change. There are, moreover, theoretical reasons for doubting the existence of organisms much smaller than those which have already been observed.

The other two papers deal with Brownian movements, that is to say, with the movements that can be observed in the case of substances that have molecules so large that their dimensions approach microscopic size. In the case of solutions of resin

Digitized by Google

and indiarubber it is not, however, necessary to use a microscope to observe the movements of the particles, for they can be seen by the naked eye if the solution be held at the proper angle, in direct sunlight. A similar movement can be observed, under the microscope, of the particles of smoke floating in the air.

In the Physical Section, E. Grimschl described a new mercury air pump, a modification of the Toepler pump, from which it differs in having connected to it a water-air pump, by means of which a receiver is maintained at a vacuum of a few millimetres. The mercury pump delivers into this vacuum, and the work is consequently greatly accelerated and reduced. Moreover, it is only necessary to lift the mercury reservoir through quite a short distance, instead of through the whole height of the mercury barometer each time.

In the Chemical Section, A. Frank described an ingenious technical method for the manufacture of hydrogen. This gas is now used on a large scale for filling balloons and flying machines, but if it could be obtained at a moderate price it could also be employed on a very large scale for metallurgical and other operations. At present it is prepared either by the action of acids or alkalies on metals, or by electrolysis, or by the action of calcium hydride. Frank, however, proposes to use, as his source of hydrogen, water gas, which, as a rule, contains about 50% of hydrogen, together with a considerable proportion of carbon monoxide, and smaller quantities of carbon dioxide, nitrogen, and oxygen. To remove these impurities he leads the gas over calcium cyanide heated to a moderate temperature in retorts. This absorbs the oxides of carbon with separation of graphite, as also the oxygen and nitrogen, the latter with the formation of cyanamide. The plant required for this process is simple: only a water-gas generator charged with coke, and a retort in which the carbide can be heated. For a fortress in which it was required to produce 2,000 cubic metres a day, one plant would be sufficient. A single passage over carbide was found enough to purify the hydrogen up to 99 to 99.7%. In order to economise the carbide, a process has been worked out for first separating the greater part of the impurities by compressing and cooling the gas. The carbon monoxide is thus liquefied, and the carbon dioxide solidifies and can be filtered off. The carbon monoxide obtained can be utilised as a source of power to perform the work of compression.

In a further communication, Frank recommends the use of cyanamide as an addition to explosives with the object of reducing the temperature of explosion. Various substances are at present used for this purpose, in different classes of explosives, for in practically all cases it is desirable to keep the temperature as low as possible without weakening the explosion. In the case of explosives used in coal mines the temperature must be kept low, to prevent danger of igniting fire damp, and in smokeless powders in order to diminish the erosive action on the bore. For these purposes Frank suggests the use of cyanamide, or dicyan-diamide, which he claims to have a strong cooling action and also a beneficial effect on the stability of the explosive. To overcome the objection that these substances are soluble in water, he is endeavouring to find a method for the manufacture of tricyan-triamide, $C_3N_6H_6$ (melamine), which shall give a good yield at a moderate cost.

L. Wöhler read a paper on a platinum product that is analogous to purple of Cassius. It is formed by the action of stannous chloride on solutions of platinum chloride, and the liquid takes different colorations according to the conditions; other reducing agents may be used instead of stannous chloride.

Escalera Silver Lead Mining Co., Ltd.—Registration has been made of the issue, on August 27, of £4,560. debentures, part of series created Jan. 30, 1907, to secure £15,000., charged on the company's undertaking and property, present and future, subject as to a certain portion thereof to an indenture dated September 26, 1906. No trustees. Previously issued of same series, £4,130.

Explosives in Refuse.—At the Manchester Corporation Refuse Destructor Works a collection of rifle cartridges has been found amongst the rubbish which was being destroyed. The greater portion of the cartridges were unspent, and included Dum-Dum bullets and cartridges of the Lee-Metford and Martini-Henry patterns. Another danger which is experienced in the destruction of refuse is the number of "Sparklets" which are found. When heated, these cartridges of compressed gas explode and shoot out of the furnace with sufficient force to cause serious injury to the men in charge of the apparatus.

Indian Notes.

THE Mysore Government is establishing a mycological and entomological laboratory to study plant diseases and insect pests in the Mysore Province.

India will be officially represented at the Franco-British Exhibition to be held in London next year, and £10,000. is being spent to bring Indian manufactures and arts to the notice of the British public.

In dealing with India the native peculiarities have to be considered. Each Presidency is distinct, even in language, manners, and customs. Some British manufacturers appear to act as if all the Presidencies were the same.

The value of the imports into India, during the month of July, compared with the corresponding months in 1906 and 1905, show a remarkable development, viz.:— Chemicals, drugs, narcotics, etc., 1905, Rs.90,14,989; 1906, Rs.9,644,828; 1907, Rs.11,399,900; Mineral and other oils, 1905, Rs.9,694,545; 1906, Rs.9,957,890; 1907, Rs.12,258,659.

Jute affords shelter to numerous insects, and remedies are sought. The most noxious to jute are (1) the indigo catterpillar; (2) the jute semi-looper; (3) the small green semi-looping caterpillar; and (4) the jute weevil. The area under jute in India is 2,941,203 acres.

In some parts the young crops of indigo have suffered great damage from locusts.

Market movements (Calcutta, 5th September) are reported as under:—

Borax.—Good demand for export, but sales limited, owing to light stocks and small production. Quotations Rs.14.8 to Rs.15.8 per bazaar maund, weight, loose, prompt delivery.

Saltpetre.—Very little doing. Nominal market rates Rs.8.0 to Rs.8.14 for Furrackabad refined, and Rs.7.12 to Rs.7.14 for ordinary 5% refraction qualities, per factory maund, weights, loose. Stocks of lower refraction qualities are small, while those of higher refraction grades are fair. Shippers generally are holding off.

Shellac.—Little doing. Quotations, T.N. in diamond, Rs.72.0. Forward positions are for the moment neglected. Last month's shipment totalled 16,000 chests.

Beeswax.—The season is closed. Stocks and supplies very small. Available qualities are not very durable. Quotations, Rs.75.0 to Rs.80.0 for local refined kinds, and Rs.65.0 to Rs. 75.0 for raw, per bazaar maund.

Castor-oil Cake.—Little business has been doing, but sellers continue firm. Prices, Rs.6.0 for average, and Rs.6.2 for picked quality per bag of two maunds, f.o.b., prompt shipment. Offerings are low.

Bone Meal.—A fair demand exists, and stocks are very moderate. Prices, Rs.72.0 for New Zealand quality, Rs.68.0 to Rs. 69.0 for usual standard of steamed quality, and Rs.61.0 to Rs.61.8 for usual standard of unsteamed quality, per ton of 20 cwts., f.o.b., for near and early shipments.

Bone-dust.—Quotations, Rs.50.0 and Rs.52.0 per ton, f.o.b., for unsteamed and steamed qualities respectively for prompt and forward deliveries, usual analysis. Offerings of all grades are very moderate.

Castor Oil.—Business small, but sellers are firm, and prices for fine qualities have advanced. Prices are Rs.12.1 to Rs.14.0 for ordinary qualities, weight, loose. For shipment, Rs.19.8½ for fair firsts, Rs.14.8½ for good seconds, and Rs.13.8½ for thirds in cases, per bazaar maund, weight, f.o.b., for near and early shipments. Offerings continue limited.

Cocoanut Oil.—Stocks are accumulating, and the market is lower. Quotations, Rs.20.8½ to Rs.22.12½ per bazaar maund, weight, f.o.b., in cases, for prompt and near forward deliveries.

Salt.—The market closed easy. Local stocks held in maund weights were: ex Liverpool 628,946, Hamburg 458,657, Aden 352,324, Saliff 183,439, Phocee 155,037, Spanish 173,788, Port Said 133,595, and Bombay 80,279. Quotations per maund were: Liverpool Rs.46.0 to Rs.50.0, Hamburg Rs.48.0, Aden Rs.42.0 to Rs.59.0, Saliff Rs.46.0 to Rs.70.0, Phocee Rs.61.0, Spanish Rs.45.0 to Rs.67.0, Port Said Rs.47.0 to Rs.61.0, and Rs.50.0. Since the reduction in the salt duty, the consumption of salt in India in the four months, April, May, June and July, has gone up 2,400,000 maunds.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improved Process for Extracting Tin from Iron-containing Tin Products such as Residues, Slag, Ashes, Scraps, Soot and the Like. Dr. H. Brandenburg, Moorenring, 29, Kempen-on-Rhine, Germany. British Patent 22,033. October 5, 1906.

According to this invention the waste products are smelted with silicate of tin, which is either prepared for the purpose of any well-known process or obtained from the slags produced during the extraction of tin by old processes, the smelting taking place preferably in the presence of a basic flux. When the waste products, and more particularly tin ore containing large quantities of iron, are melted with silicate of tin, or with a slag containing a silicate of tin, the reaction takes place in such manner that the tin of the waste products treated and the tin contained in the slag or in the silicate in combination with the silica appears in metallic state, whilst the iron is combined with the silica. Any oxide or dioxide of tin that may be mechanically dissolved in the slag reacts in a similar manner. In this way, tin free from iron is obtained, partly consisting of the tin of the raw material, and partly of the tin of prepared silicate of tin referred to above, or of the oxide or dioxide of tin dissolved in the slag.

Improvements Relating to the Separation of Gases from their Mixtures and particularly the Separation of the Constituents of Atmospheric Air. Société l'Air Liquide and René Jacques Lévy, both of Rue St. Lazare, Paris. British Patent, 3,302. February 9, 1907.

This invention has reference to a process of the kind described in Specification No. 5 649 of 1903, for obtaining the separated gases in a pure condition. According to this prior process, liquid air is separated into oxygen and nitrogen by a method of rectification, a portion of the gaseous nitrogen resulting from this rectification is reliquefied, and the reliquefied nitrogen so obtained is utilised for completing the rectification. These main features are again found in the present specification, which consists in certain improvements in this prior process.

According to this later invention, which may be used in conjunction with or in substitution for the previous process, the whole or part of the gaseous nitrogen resulting from the separation effected under pressure is reliquefied whilst still under pressure by causing it to vaporise the liquid oxygen resulting from the separation and existing at a lower pressure than that at which the separation is effected. This modification of the prior process is advantageous because, assuming the pressure at which the separation takes place to be the same in each case, this novel feature enables the quantity of gas reliquefied to be raised to its maximum, and the ultimate separation to be more complete.

A Process for Recovering Chromic Acid from Solutions of Sulphate of Chromium, in an Electrolytical Manner. Chemishe Fabric Buchau, 1, Carlstrasse, Magdeburg, Prussia. British Patent, 9,636 April 25, 1907.

This invention relates to a process for the oxidation of solutions of sulphate of chromium to chromic acid, and consists in dispensing with separation of the anode and cathode solutions and avoiding reduction of the chromic acid by hydrogen formed at the cathode, by the addition of sulphate or acetate of an alkali, or a mixture of these.

Improvements in the Manufacture and Production of Colouring Matter Lakes. Badische Anilin and Soda Fabric, Ludwigshafen-on-the-Rhine. British Patent, 10,363. May 3 1907.

The invention claims:—(1.) The manufacture of colouring matter lakes by converting an azo colouring matter, obtainable by combining either amido-azo-benzene, or amido-azo-toluene, with 1-naphthol-4-sulphonic acid, into an insoluble salt thereof with a single metal either in the presence of a substratum, or not. (2.) The manufacture of colouring matter lakes as described in the foregoing example. (3.) As new articles of manufacture colouring matter lakes which can be obtained according to the foregoing claiming clauses.

Improvements in the Manufacture of Soap. A. F. Thompson, 12, Frognal Parade, Hampstead, London, N.W. British Patent, 18,925. Aug. 24, 1907.

The invention relates to the manufacture of that class of soap described, for example, in Specification No. 492 of 1867, in which two or more soaps are combined by inlaying or inletting for the purpose of obtaining a distinctive result whilst retaining the particular quality, perfume or appearance of each. The present invention consists in forming one or more cruciform recesses in a bar or cake of soap having certain characteristics of colour and perfume, for example, and inserting into such recess or recesses one or more portions of soap having certain different characteristics, thereby maintaining such characteristics separate and distinct.

Manganese in India.—The *Manchester Guardian* says:—"The manganese industry in India continues to make remarkable progress, and efforts are now being set on foot to erect smelting machinery on a large scale in Mysore, which may be regarded as the centre of the industry. The present ruler of Mysore is keenly alive to the possibilities of his State, and has recently ordered very extensive geological and mineralogical surveys to be carried out, in the hope of locating further deposits of this metal. A drawback to the industry at the moment is the considerable distance that coal has to be brought and its consequent dearness, and to this is attributed the fact that smelters have not before been erected. Pressure is being brought to bear on the Indian Government, however, to consent to place Mysore in quicker and more direct communication with the nearest coal fields, and it is hoped that this will meet with success. Those who are responsible for the development of the industry are not without hope of soonor or later locating coal in Mysore itself."

CHEMICALS, ETC., IN RUSSIA.

IN his report on the Trade and Commerce of Riga, during 1906, just issued by the Foreign Office, Mr. Consul Woodhouse states that in spite of the disturbed state of the country the trade of Riga for the past year left little to be desired.

The following table indicates the position of the United Kingdom and other countries with regard to the imports into Riga during 1904-05 :—

Country.	Per Cent. 1904.	1905.
United Kingdom	46.3	38
Germany	34.6	45.6
Denmark	3.5	4.6
Netherlands	5.8	4.7
Belgium	3.6	2.9
Other countries	6.2	4.2

The exports from Riga in 1906 were in advance of those of any previous year, and exceeded the shipments of 1905—a record year—by 20%. Ten years ago the total value of the export, under the most favourable circumstances, did not exceed, £7,000,000. Now they reach £16,588,400. The extension of railway communication and the increased facilities for transport —especially of produce from the eastern provinces of Siberia —have largely contributed to the commercial activity of the port of Riga.

The linseed crop in these provinces was satisfactory, and, consequently, there was increased export of this article. It amounted to £32,315 tons, against 29,339 tons in 1905.

The total exports of linseed from the northern and southern parts of Russia in the years 1904-06 are given below :—

Port.	1904 Tons.	1905. Tons.	1906. Tons.
Riga	16,225	29,339	32,315
Libau	9,839	13,672	11,401
Windau	94	114	102
Pernau	2,106	2,141	4,241
St. Petersburg	14,476	27,016	28,873
Reval	2,420	4,253	5,430
Black Sea ports	7,889	7,397	4,111

The total export of linseed from Russia is put down at 115,857 tons.

Riga's export of oil cake is increasing. Within the five years' period 1896-1900 about 43,200 tons per annum have been exported. Last years' export amounted to 75,900 tons, chiefly consisting of linseed cake.

The following were amongst the articles of export from Riga during 1904-06 :—

		1904.	1905.	1906.
Linseed	tons	16,225	29,339	32,315
Tar and turpentine ..	,,	1,443	1,871	1,236
Oils—				
Linseed	,,	53	27	32
Olconaptha	,,	9,665	8,038	8,130
Petroleum	,,	18	68	189
Oilcake..	,,	69,840	60,544	75,900
Pyrites (for Pernau) ..	,,	11,241	13,876	21,354
Lead	,,	3,743	6,000	2,470
Metal ore	,,	12,980	11,500	17,000
Olive oil	,,	285	182	345
Resin	,,	4,810	7,245	4,032
Salt	,,	272	250	350
Tanning materials ..	,,	2,930	3,223	5,562
The imports included :—				
Chalk	tons	61,357	34,100	20,000
Chemical manure (superphosphate	,,	37,705	30,500	42,416
Copra	,,	5,144	10,975	10,254
Drugs	,,	5,000	5,150	7,358

LIBAU.

The shipment of linseed continued, and the quality was better than before. Quantities were shipped to Stettin. The Plata and Calcutta seed is the cheaper, though the Baltic seed is the superior in oil giving qualities.

WINDAU.

The Vice-Consul at Windau reports that trade at that port suffered a decrease during 1906 of £774,403. in exports and £257,960. in imports compared with the previous year. This decline was due entirely to the transit trade, as the timber export trade—the trade proper of Windau—shows an increase of 50% over 1905.

Linseed is not a very important item in the export, but it was fairly well maintained. Oilcake suffered also from the prevailing depression and scanty harvest, and the export dropped from £10,888. in 1905 to £10,423.

PERNAU.

In 1906 8,803 quarters of crushing linseed were shipped as against 6,430 qrs. in 1905. The balance of the arrivals was sent to Riga.

Of iron pyrites, 21,354 tons (17,957 tons Westphalian and 3,397 tons Spanish) were imported against 13,876 tons Westphalian in 1905. Of cork-wood, 289 tons, against 246 tons, and of chemical manure, 3,040 tons against 2,170 tons were imported in 1906 and 1905 respectively.

RUSSIAN CHEMICAL MARKETS.

THE chemical market report from Riga states that for the past month there has been a strengthening of the position of lemon salt, which, during the past three months, has made progress to the extent of 10 roubles (£1.) per pood, having risen to 50-52r. Besides the local and other causes peculiar to the season, the firmness of the markets abroad has also assisted in causing the advance. During the summer there has been a weakening in the position of Russian turpentine, which has lost value, and is quoted at 3r. to 3r. 10c., as against 3r. to 3r. 30-50c. Some of the principal quotations are:—Nitric acid (36° B.), 3r. 50c. to 4r.; borax crystals, 4r. 45-70c.; white lead, 4r. 80c. to 5r. 20c.; sulphate of copper, 6r. 75c. to 7r.; wood spirit (95-96%), 6r. 50c. to 7r.; superphosphates (13-14%), 52-56c.; acetic acid (30%), 2r.-2r. 50c.; bichromate of potash, 8r. 50-75c.

Suggested Technical and Commercial Library for Manchester.—On Wednesday week, an important deputation from the Manchester Chamber of Commerce waited upon the Free Libraries Committee to make representations in favour of a more generous provision of technical and commercial books and periodicals in the Free Reference Library of the city. Mr. E. H. Langdon, the President of the Chamber of Commerce, who introduced the deputation, said that they had the support of many societies interested in chemistry, electrical and general engineering, etc. Mr. Ivan Levinstein urged the Libraries Committee to establish a comprehensive technical library in Manchester; such a provision, he said, would be a valuable addition to the School of Technology. Dr. Hutton, of the Manchester University, supported the recommendation, and representatives of the Engineering and Chemical Sections of the Chamber also expressed their views.

Postal Changes.—On the 1st inst. the Post Office commenced the issue of reply-paid coupon stamps, at the price of 2½d. each, for the purpose of prepaying replies from any post office within the Postal Union. The addressee, on presenting the coupon, will receive in exchange a stamp of the value of 2½d. for the reply letter.

Market Reports.

THE AMERICAN CHEMICAL MARKET.

NEW YORK, September 17, 1907.

(Rate of Exchange, $4.855 = £1.)

Nitrate of soda is firmer, and shows more activity; spot parcels are quoted at $2.35. to $2.40. per 100 lbs., and futures $2.40. to $2.45. Sulphate of ammonia has declined somewhat, and more business is being reported at $3.02. to $3.05. per 100 lbs., for immediate delivery, with futures at about the same price. Grey muriate of ammonia is moving along rather slowly, and principally on contract; it is quoted to-day at 6c. per lb. White electrical sal ammoniac, 5¾c. to 6c. per lb., and lump, at 9¼c. Lump carbonate of ammonia rather dull, most of the deliveries being on contract; prices, however, are well maintained at 7⅝c. to 7⅞c. per lb. Bleaching powders are rather dull on spot, but contract deliveries are heavy; spot is quoted at $1.30. Sulphate of copper is weak, but on account of the unsettled condition of the metal, prices are ranging anywhere from 6¼c. to 7c. per lb. White powdered arsenic is firm; spot parcels in car-load lots are bringing 7⅛c., while immediate shipments from abroad are quoted at 7c. per lb. Red Saxony arsenic remains unchanged. Calcined carbonate of potash is rather scarce on spot, on account of heavy deliveries on contract, and prices therefore are well maintained at 4c. to 4½c. per lb. for the 80-85%, and 4¾c. to 5¼c. for the 96-98%; the hydrated is rather dull at present, and is quoted at 4¾c. to 5c. per lb. Caustic potash, although selling rather fairly on contract, has shown no improvement for spot orders; prices are about the same, 5¼c. to 5¾c. per lb. Chlorate of potash and soda are moving along briskly, chiefly on contracts, however, at prices ranging from 9¼c. to 9½c. per lb. for the potash, and 8¼c. per lb., f.o.b., works, in car-load lots, for the soda. Bichromate of potash is now quoted at 8¾c., and soda at 7¼c. per lb., both selling rather freely at these figures. Oxalic acid is weak; spot parcels are offered at 8¼c., with no sales reported.

TAR AND AMMONIA PRODUCTS.

Friday.

Benzols firm, and quotations are given at 9d. for 90's, and 9d. to 9¼d. for 50-90's. Crude tar, 15s. 6d. to 19s. 6d. per ton, Thames; 1½d. to 1⅝d. per gallon, delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 26s. to 26s. 6d., f.o.b.; Gas Company, 29s.; East Coast, 25s. to 25s. 6d.; West Coast, 24s. 6d. to 25s. 6d. Refined naphthalene, £6. 10s. to £8. 10s. Toluol, 90%, 10d. to 10½d.; pure, 1s. 2d. Carbolic acid, crude, 50%, 1s. 5½d. to 1s. 5¾d.; 60%, 1s. 8½d.; 75%, 1s. 11¾d. to 2s.; crystals, 39-40, 5½d.; 34-35, 5¼d. Cresylic, 95%, 1s. 1d. to 1s. 1½d. Anthracene, 40 to 45 per cent. A, 1½d. to 1¾d. Pyridin, 4s. to 4s. 3d.

Sulphate of ammonia steady. Nearest values are:—Beckton, October-December shipment, £12. 2s. 6d.; and January-April, £12. 5s.; Beckton terms, £11. 12s. 6d.; London, £11. 13s. 9d. to £11. 15s.; Hull, £11. 15s. to £11. 16s. 3d.; Liverpool, £11. 17s. 6d. to £11. 18s. 9d.; Manchester, £11. 15s.; Leith, £12. to £12. 2s. 6d., and January-April, £12. 5s.

Nitrate of soda, ordinary, 11s. 3d.; refined, 11s. 9d. Liverpool ordinary, 11s. 3d.; refined, 11s. 4½d. Official quotations:—Cargoes, off coast or due, 11s. 1½d.; ditto, for prompt shipment, 11s. 7½d.

FERTILISER MATERIALS.

Friday.

Steadiness in all markets for manure material is the prevailing feature, and generally there is rather a better demand.

Shippers of East Indian bone meal having declined bids of £4. 17s. 6d. per ton for good lines, have now advanced their price to £5. per ton, nett, c.i.f. terms Liverpool, but so far this

Digitized by Google

price has not been reported as paid. On spot, quotations remain £5. 5s. to £5. 10s. per ton, according to quality, ex store.

Nitrate of soda is still a quiet market, but prices remain steady at 11s. 1½d. per cwt. for 95%, and 11s. 4½d. per cwt. for refined quality, ex store.

For mineral phosphates of the various grades, values remain very steady for all delivery positions.

THE LONDON METAL MARKETS.

THURSDAY.

Copper: Standard brands, £62. to £62. 5s. cash, and £62. to £62. 5s. three months. Tin: G.M. quality, £156. 10s. to £157. cash, and £154. 10s. to £155. three months; English, £158. to £160. Lead: Soft foreign, prompt, £21.; October shipment, £20. 10s.; November, £19. 12s. 6d.; December, £19. 5s.; English, £21. 10s. Spelter, ordinary brands, prompt, £21.; forward, £21. ex ship; hard, £18., f.o.b. Antimony, £43. to £45.; ore, £14. Bismuth, 6s. 6d. Quicksilver, £7. 7s. 6d.; seconds, £7. 6s. 6d. Nickel, 1s. 10d. per lb. Aluminium, £150. Wolfram, 40s. to 42s. 6d.

MISCELLANEOUS CHEMICAL MARKET.

THURSDAY.

There is a fairly steady and good demand for all descriptions of chemicals, and with the prospect of higher costs of manufacture, due to the advances in fuel and other materials, there is a general firmness in values, with advances quoted and paid in several descriptions for deliveries over 1908. Caustic soda has been advanced 10s. per ton for this and next year's delivery, which makes the price now for 70%, £10. 5s. per ton; 74%, £10. 15s., and 77%, £11. per ton, f.o.b. Liverpool. Bleaching powder stands at £4. 7s. 6d. to £4. 12s. 6d. per ton f.o.r. Alkali, 58%, is unchanged at £4. 10s. f.o.r., and the same price holds good for 1908. Saltcake, in bulk, is firm at 42s. 6d. per ton f.o.r Sulphate of copper stands at £23. to £23. 10s. per ton for next Spring delivery. Chlorates unchanged at 3½d. per lb. Grey acetate of lime is steady, both prompt and future delivery, at £12. 10s. c.i.f. Acetate of soda rather dearer at £17. 10s. Brown sugar of lead, £26. 10s. Caustic potash, 88-90%, £24. 10s. c.i.f. Manchester: Carbonate of potash, 90%, £18. 10s. There is continued good demand for muriate of ammonia at £24. 10s. Prussiates are steady at 3⅝d. to 5⅝d. per lb.

LIVERPOOL OIL AND COLOUR MARKET.

THURSDAY.

OILS.—Palm oil firm, sales including Benin at £27. 15s. for November-December shipment, and Lagos, £30. 10s. to £31. per ton. Linseed oil quiet at 26s. 3d. to 27s., for Liverpool makes in export casks. Cottonseed oil steady at 28s. 6d. to 29s. for Liverpool refined in export barrels. Rosin in good demand. Tallow quiet, at 31s. for South American beef, and 31s. 6d., c.i.f., for South American mutton. Petroleum quiet, at 6¾d. for Russian and Roumanian, and 7¼d. to 8¼d. for American refined oils. Petroleum spirit in fair demand, at 1s. 0½d. to 1s. 3d. per gallon.

COLOURS.—Red lead, English, £21. 10s., white, £22. 10s. to £22. 15s.; emerald green, 1s. per lb.; Brunswick green, 16s. to 45s. per ton; venetian red, lump, 7s. 6d., powder, 5s. to 6s. 6d. per cwt.; vermilion, English, 2s. 4d., China, 3s. per lb.; Prussian blue, 1s. 10d. to 2s. 6d. per lb., Brunswick, 28s. to 34s. per cwt.

LIVERPOOL DRYSALTERIES.

THURSDAY.

Montreal potashes and pearl ash nominal. Bark steady. Logwood and fustic quiet at recent quotations. Castor oil steadily held at 3½d. for first pressure French; 3¼d. for second pressure French; 3½d. for good seconds Calcutta, and 3⅜d. for Calcutta shipment on to January next. Cutch steady. Gambier firm, at 29s. 6d. to 30s., for store lots of cubes; 28s. 1½d. for September-October and October-November shipment; 28s. 3d. for November-December; block quiet at 21s. 6d. Glucose: American liquid, 43%, 12s. 6d. and 12s. for October-December shipment. American powdered starch, 10s. 9d. on spot, and 10s. 3d., c.i.f., for shipment; pearl, 10s. 3d. on spot, and 9s. 9d., c.i.f., for shipment. Shellac quiet at 155s. for fair T.N. orange on spot. Cream of tartar, 98% foreign powder, 81s.; 98%, 79s. Citric acid: English, 1s. 10d.; foreign, 1s. 9¾d. Tartaric acid: English, 11d. to 11¼d., on spot; foreign, 10¾d. to 10⅞d.

HULL PAINT, OIL, AND COLOUR REPORT.

THURSDAY.

OILS.—Linseed oil on the week has not maintained its strong position, and closes lower and quieter; the shipments of seed from America have been heavy, and the arrivals here have been fair, and the general promise of supplies all round are good, excepting from Russia. Imports here for the week were:—10,654 qrs., making a total of 594,992 qrs., against 457,220 qrs. last year. Of cottonseed the imports were 4,603 tons; total since January 1st, 271,460 tons, against 218,830 tons last year. Other imports have been to date:—Wheat 3,150,546 qrs., against 3,055,603 qrs.; flour 157,397 cwts., against 280,610 cwts.; rapeseed 89,459 qrs., against 86,174 qrs.; oilcake 20,150 tons, against 31,459 tons; hemp 100,144 cwts., against 124,350 cwts.; olive oil 3,554 tuns, against 3,077 tuns; tar 7,468 brls., against 10,514 brls. Amongst the weekly imports are:—Lard, 2,089 cwts.; margarine 4,550 cwts.; sugar, 16,534 cwts.; glucose, 1,173 cwts.; colours, 2,032 pkgs.; hides, 540 cwts.; wool, 150,776. Exports:—Oil, 10,019 cwts.; colours, 1,934 pkgs.; chemicals, 2,314 pkgs. Linseed oil closes easy; naked, spot, 24s.; October-December, 22s. 9d.; January-April, 23s.; boiled and refined, £1. to £1. 10s. per ton extra. Exports during the week:—10 tons Austria, 2 Belgium, 1 Denmark, 5 Norway, 6 Turkey; total, 24 tons. Linseed: La Plata, spot, 43s. 9d.; September-October, 44s.; October-November, 44s. 1½d.; December-January sold at 42s.; January-February is 41s. 9d. Refined cottonseed oil, after improving considerably, closes easier; naked, spot, 26s. 9d.; October, 25s. 5d.; November-April, 23s. 1½d.; casks £1., and barrels £1. 7s. 6d. per ton extra. Exports during the week:—6 tons Denmark, 20 France, 44 Germany, 36 Holland, 7 Italy, 128 Sweden; total, 240 tons. Cottonseed easier; spot, £7. 15s. to £7. 16s. 3d., ex store; September, new seed sold at £7. 10s.; October, £7. 13s.; November-January, £7. accepted; Bombay, September-October, £6. Rapeseed, Jamba, 42s. 6d., November-December. Turpentine firm; spot, 39s. 6d.; November-December, 40s. 6d.; January-April, 41s. 6d.; May-June, 40s. 3d. Russian ditto, 20s. 3d. spot. Assyrian, 16s. Olive oil, Levant, £39. to £40. per tun. Castor oil, November-December, 1sts, 30s. 6d.; 2nds, 29s. 6d.; January-March, 6d. per cwt. less.

TYNE CHEMICAL REPORT.

THURSDAY.

Market steady, the chief feature being the advance of 10s. per ton in the price of caustic soda for prompt and forward delivery, manufacturers no doubt feel the effect of the high prices now current for coals and other raw materials. Quotations now are: 76-77%, £11.; and 70%, £10. 5s. per ton. Bleaching powder quiet at £5. 5s. per ton. Soda crystals in fair demand at £3. to £3. 2s. 6d. per ton gross weights. Sulphur scarce at £5. to £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £10. 10s. per ton, nett; do., 70%, £9. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £29. 10s. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—Continue fairly steady, and with a good arrival of steamers, business has been somewhat brisker. Bunker coals are plentiful and a shade easier in price. Coke is quiet. To-day's quotations:—Best Northumbrian steam, 15s. 9d. to 16s. 3d. per ton; second qualities, 15s. per ton; small steam coals, 10s. 6d. to 11s. per ton; unscreened coals, 13s. 3d. per ton; best gas coals, 16s. to 17s. per ton; Durham bunkers, 13s. to 14s. per ton; best coking coals, 15s.; household coals, 16s. 6d. to 17s. 6d. per ton; foundry coke, 25s. per ton; gas coke, 20s. per ton.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, THURSDAY.

The spot position for sulphate of ammonia, Leith and Glasgow deliveries, remains practically unchanged, value being about the same, and movement but moderate as before. With regard to forward business, there is nothing on report as having been carried through; the disposition to buy is rather more evident, but sellers are in the mood to hold off a little. Sulphate of copper continues in a constantly shifting condition, with large reductions as the rule, following the uneasiness of the metal. In the section of the ordinary chemicals, the chief feature is the advance in all strengths of caustic soda. The other lines are as before, steady of movement, at current rates. Business in mineral oils and paraffins, home makes, continues very good, at same figures, with the exception of 865°, lubricant, which is scarce and dearer.

Chief prices current are:—Alum (in lump), £5. 5s. to £6., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 12s. 6d. to £4. 17s. 6d., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3½d., nett, Glasgow; creosote (ordinary coal-tar and blast-furnace), 2¼d. to 2½d., naked, f.a.s. Glasgow; nitrate of soda, 11s. 1½d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2¾d. to 2½d. per lb.; paraffin wax, 120° semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¾d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating), 865°, £5. 15s. to £6.; 885°, £6. 7s. 6d. to £7. 7s. 6d.; 890-895°, £7. 2s. 6d. to £8. 2s. 6d.; prussiate of potash, 5¾d. to 5⅞d. nett, f.a.s. Glasgow; salammoniac, first and second white, £42 and £40., less 2½% any port; saltcake, 40s.; to 42s. 6d. soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £3. to £3. 2s. 6d.; sulphate of ammonia, £12. to £12. 1s. 3d., prompt f.o.b. Leith; sulphate of copper, £22 10., , to £23 less 5% Liverpool, prompt.

New Companies.

Artificial Diamond Co., Ltd.—Capital, £10,000., in £1. shares. This company has been formed to take over and amalgamate the businesses of imitation diamond merchants carried on in Great Britain and various towns in Europe and Asia by Messrs. Goldsoll, Kaplan and I. and W. Blumenthal, and to adopt an agreement with F. J. Goldsoll and others. No initial public issue. The first directors are F. J. Goldsoll (chairman), N. S. Kaplan and W. Blumenthal (all permanent). The two last-named are managing directors. Qualification, £100. shares or stock. Registered office, 96, Oxford-street, W.

Brundholme Mining Syndicate, Ltd.—Capital £1,000., in £1. shares. This syndicate has been formed to acquire any mines, mining rights and metalliferous land in Cumberland or elsewhere, to enter into an agreement or "take note" with W. T. Crosse, for leave to search for lead ore, blende, copper ore and other minerals in and under certain lands, etc. No initial public issue. The first directors are J. W. Pattinson, J. S. Quirk, W. H. Borlase, Dr. R. J. Hutchinson, J.P., and J. Kidd. Qualification, £50.

Cleanall, Ltd.—Capital £1,000., in £1. shares. This company has been formed to adopt an agreement with V. Talbot, and to carry on the business of manufacturers of soap and other cleansing materials, etc. No initial public issue. The first directors are V. Talbot and G. Talbot. Registered office, 17, St. Christopher-place, Wigmore-street, W.

Nicotine Extraction Syndicate, Ltd.—Capital £5,000., in 4,900 ordinary shares of £1. each, and 2,000 deferred shares of 1s. each. This syndicate has been formed to acquire, sell, and exploit patents for the extraction of nicotine from tobacco. No initial public issue. Registered office, 8, Old Jewry, E.C.

Karak Rubber Co., Ltd.—Capital £50,000. in £1. shares. This company has been formed to acquire lands or other immovable property in the Malay Peninsular, India, Ceylon, the East Indies, or adjacent parts of Asia, to grow, treat, cure, manufacture, prepare for market, and deal in indiarubber, guttapercha, balata and other gums and natural products of any kind, etc. Minimum cash subscription, 10% of the shares offered to the public. The first directors are A. Bethune, F. W. Barber, R. K. Magor and C. T. Sidgwick. Qualification, one share. Remuneration, £50. each per annum and 5% of the profits available for distribution, divided. Registered office, 138, Leadenhall-street, E.C.

Kalsite, Ltd.—Capital £10,000., in £1. shares. This company has been formed to adopt an agreement with the International Finance and Development Corporation, Ltd., for the acquisition of an invention and patent rights, relating to a building composition, and to carry on the business of manufacturers of and dealers and workers in cement, lime, gypsum, plaster, whiting, clay, gravel, sand, artificial stone and builders' requisites, etc. No initial public issue. The subscribers are to appoint the first directors. Qualification, any shares or stock. Remuneration, £100. each per annum (chairman, £150.) Registered office, 15, George-street, Mansion House, E.C.

Lilita Nitrate Co., Ltd.—Capital £100,000., in £1. shares. This company has been formed to acquire the lands and nitrate grounds in the Department of Taltal, Chili, known as Terrenos Lily, and to adopt an agreement with the Nitrate Securities Trust, Ltd. Minimum cash subscription, 2,000 shares. The first directors are F. F. C. Herzog, C. H. Williams, A. C. Lowe and A. F. B. James. Qualification, £250. Remuneration, £250. each per annum (chairman, £350.) Registered office, 10, Lime-street, E.C.

Pacific Oilfields, Ltd—Capital £250,000., in £1. shares. This company has been formed to acquire about 5,876 acres of land in the Counties of Santa Barbara and San Luis, Obispo, California, and to adopt an agreement with the Balfour-Guthrie Investment Co. (incorporated in California), and to carry on the business of producers, refiners, storers, suppliers and distributors of petroleum and its products, etc. Minimum cash subscription, 10% of the shares offered to the public. The first directors are R. B. Forman, A. B. Williamson, T. Royden, C. H. Moore and W. Mackenzie. Qualification, £1,000. Remuneration, £200. each per annum (£100. extra for the chairman). Registered by Rawle, Johnstone and Co., 1, Bedford Row, W.C.

Risicol, Ltd.—Capital £10,000., in £1. shares (4,000 preference). This company has been formed to carry on the business of importers and manufacturers of and dealers in pharmaceutical, medicinal, chemical, industrial and other preparations, compounds, cements, oils, paints, varnishes, drugs, acids, powders, proprietary articles, etc., and to adopt an agreement with R. Demuth. No initial public issue. The first directors are W. E. Whineray, H. C. Forrest, F. Goswin, and R. Dumuth. Qualification, £100.

S. Kenyon, Ltd.—Capital, £3,000., in £1. shares (2,000 preference). This company has been formed to take over the business of an oil and varnish manufacturer, formerly carried on by S. Kenyon, of 10, Winwick-street, Warrington. No initial public issue. Registered without articles of association. H. Hutcheson is the first director. Registered office, 10, Winwick-street, Warrington.

Solidite Fire Proofing Co., Ltd.—Capital £10,000., in 8,000 ordinary shares of £1. each, and 40,000 deferred shares of 1s. each. This company has been formed to acquire and turn to account patents and inventions for the construction of fireproof and other floorings, walls and ceilings, etc. No initial public issue. Table "A" mainly applies. Qualification, 100 deferred shares. Registered office, 199, Piccadilly, W.

Washall-Millene Co., Ltd.—Capital £3,000., in £1. shares. This company has been formed to take over the business of soap manufacturers and merchants, carried on at Farnley, Leeds, as W. M. Turner and Co., Ltd., and the Venera Soap Co., and to adopt an agreement with J. T. Oldfield and G. F. Oldfield. No initial public issue. The first directors are G. F. Oldfield and J. T. Oldfield. Qualification, £250. Registered office, Farnley, Leeds.

William Jackson, Ltd.—Capital £8,000., in £1. shares (4,000 preference.) PRICES CURRENT.

FRIDAY, October 4, 1907.

PREPARED BY MESSRS. HIGGINBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified. The price in different localities may vary.

		£	s.	d.
Acids :—				
Acetic 25% and 40%	per cwt.	9/-	&	13/-

NOTICE.

Correspondents will please note that our Manchester address now is

Barton House,
66, Deansgate.

Notices.

All communications for the *Chemical Trade Journal* should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C.

Our Registered Telegraphic Addresses are:—

"Trepex, London."
"Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central.
Manchester: 3060.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*—payable in advance—including postage to any part of the world, are as follows:—

Yearly (52 numbers) ..... **12s. 6d.**
Half-Yearly (26 numbers) ..... **6s. 6d.**
Quarterly (13 numbers) ..... **3s. 6d.**

Back Numbers of the Journal.—In future all back numbers will be charged at 6d. per copy, plus postage.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than **Tuesday morning.**

Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To Be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

30 Words and under ..... 2s. 6d. per insertion.
Each additional 6 words ..... 0s. 6d. ,,

Advertisements of Situations Wanted are inserted at the following rates when cash is sent with order:—

24 Words and under ..... 1s. 0d. per insertion.
Each additional 6 words ..... 0s. 3d. ,,

Advertisers would oblige by writing advertisements and letters of instructions on separate sheets of paper.

Trade Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

Advertisements intended for insertion in the current week's issue should reach the office by Thursday morning at the latest.

CURRENT TOPICS.

THE NEW AUSTRALIAN TARIFF.

ELSEWHERE in this issue will be found the first part of a special abstract of the new Australian tariff proposals, so far as they affect the chemical and allied trades. The reception of the new tariff in this country has been a curious one. Manufacturers who anticipated large concessions in favour of British traders have been greatly disappointed, and, as will be seen from the figures themselves, the import duties on manufactured goods will, in future, constitute a very serious barrier to trade with the Australian Commonwealth.

British manufacturers are by no means alone in their concern at the increased tariff. We notice that the French Chamber of Commerce at Sydney has transmitted an emphatic denunciation of the new tariff to the French authorities at home. It is pointed out that the import duties are increased in enormous proportions, ranging from 25% to 80%; that on most manufactured articles from France the new duties are levied, even on products considered as raw material, and on goods necessary to industry, such as cream of tartar and tartaric acid; and, further, that the effect of the new tariff will be to build against French trade with Australia a tariff wall well-nigh impenetrable to external trade. The fact that the rates on British manufactures are slightly less than on foreign goods does not affect the situation in any material degree, and there can be no doubt that the tariff, unless considerably amended during its passage through the Commonwealth Parliament, will seriously diminish the volume of imports, both British and foreign, into Australia.

NITRATE OF SODA.

The September shipments of nitrate to Europe were 81,490 tons, and the quantity "loading" on October 1 was no less than 190,000 tons, compared with the official mid-monthly estimate of 102,900 tons. Although the imports were 18,680 tons less than in September, 1906, and the demand practically *nil*, the port deliveries are given as only 4,640 tons less than last year, and 10,980 tons *more* than in 1905. The "visible supply" comes out at 406,910 tons, compared with 383,080 tons a year ago, European stocks being 132,900 tons against 87,510 tons at September 30, 1906. Arrivals have been more numerous since the beginning of the month, the consequence being that the market weakness reported in our last issue has become more accentuated.

The leading Hamburg trade circular states that "business with inland consumers has for weeks past been at a standstill, and few transactions have taken place in refined nitrate, as only immediate requirements are filled." Prices are accordingly nominal in all positions, and speculative holders are anxious sellers without finding buyers. The

Digitized by Google

cargo which arrived at Plymouth for orders on July 30 is still there eating its head off on demurrage; the stubborn owners, who might have got about 10s. 8d. per cwt., cost and freight, would now have to accept 10s. 3d., or less. As was to be expected, on account of the national holidays in Chili last month, the output of nitrate was smaller than in August, the estimate being 139,914 tons, against 160,959 tons; the shrinkage of 21,045 tons is, it must be confessed, somewhat startling, comparing as it does with one of 11,698 tons between the same two months last year; the output capacity has since enormously increased, while the available labour has certainly not diminished. Notwithstanding this paradoxical result, stocks on the West Coast have risen to the unprecedented total of 585,000 tons, against 555,000 tons a year ago, and nitrate for prompt shipment has fallen to 8s. 10d. (nominal) per quintal, f.o.b. At this time last year it was in strong demand at 9s. 7½d. Telegraphic advices received as we go to press state that the market is flat, with a lower tendency all round.

The general position, which is becoming interesting, will be reviewed at an early date.

THE AMATEUR IN SCIENCE.

At the opening meeting of the new session of the Manchester Literary and Philosophical Society, last week, Professor H. B. Dixon, M.A., F.R.S., the newly elected president, devoted his inaugural address to a consideration of some of the work recently done in chemical science, and especially that on the properties and reactions of gases at high temperatures. Reference was made to the work on radio-activity, with which was intimately associated the name of Professor E. Rutherford, whom they most warmly welcomed in their midst that evening as a candidate for membership; the brilliant work of Messrs. Barlow and Pope, by which the volency of the chemical atom had been connected in a definite manner with its volume in crystalline structures; and the researches of Professor Perkin on the formation and stability of various carbon rings, more particularly those on the camphor and terpene series, which were crowned by the discovery of processes for the synthetical preparation of camphor and of terpene in the laboratory. The speaker then dealt at greater length with the work in which he was most interested personally, and with which many of his own researches were connected, viz., the propagation of the explosion wave in gases; the direct determination of the specific heat of carbonic acid gas; the temperature of the ignition points of gases, and the redetermination of the atomic weight of chlorine. In the latter part of the address, the President made a few remarks on some matters more directly concerning the society and its proceedings. "Our membership," he said, "is not so large as it once was, and I have heard more than once in the last ten-years dismal forebodings of imminent decay. We may have been too conservative towards new ideas; we may have been too slow to meet the changing conditions of the city's life; we may have leaned too much to philosophy and too little to literature, but I am convinced that as a scientific society there is nothing vitally wrong with us. Those who have been connected with this society for many years cannot help noticing the gradual change which has come over our *personnel*. One of the oldest and most devoted members, the late Dr. Schunck, in his farewell letter to the society, deplored the increase of the professional element and the disappearance of the amateur. I would respectfully join in that regret.

"I suppose, as the sciences become more specialised, and as measurements become more refined and the instruments needed more costly, the amateur may feel that he cannot keep pace with those who devote their lives professionally to such studies in institutions equipped at the public expense or at that of the pious founder. There is some reason for this feeling; but I think there is none for another feeling which I believe exists—that professional men of science are jealous of the amateur, and by a conspiracy of silence or contempt seek to obscure his merits and so maintain their own prestige. Does not the amateur bring to our discussions a freshness of ideas which more than compensates for any possible defect of critical judgment? I know that I am very grateful for ideas received in this meeting-room, and I feel sure that many of our members feel similar gratitude. I would, then, plead for the cultivation of the amateur. There is another connected danger which I have heard threatens us. The society is being swallowed up by the University. Speaking as a member of that University, I would only ask, 'Why should we?' We surely have enough lecturing to satisfy our professorial zeal; we are not ambitious to re-start evening classes—unpaid. I think I speak for all my colleagues when I say that we come here because this society knows no distinction among its members, who meet on a perfectly equal footing, whether professors or manufacturers, professional men or students, because criticism is informal and open to all; because it is advantageous that we should have mutual interchange of experience and ideas—especially between men of the laboratory and men of the works; and because it is our pride to maintain as best we may the tradition of this spot, hallowed by the fame of those achievements that know no wane."

GOLD PRODUCTION IN RUSSIA.

The quantity of gold smelted in Russia in the first six months of 1907 is tabulated in *Soloto y Platina* as follows:

Laboratory (Treasury).	Slimes.			Alloys.			Pure.		
	Poods.	Funt.	Sol.	Poods.	Funt.	Sol.	Poods.	Funt.	Sol.
Blagoveschtchensk	233	19	64	227	14	84	Not given

Nikolaieff (Russo-Chinese) Bank. Up to March only	3	28	68	3	22	90	Not given		

September Trade Returns.—The Board of Trade Returns for September show an increase of £281,441. in the imports during September, the figures for the month being £45,341,276., against £45,059,835. in September, 1906. The total exports during September were £35,156,320., against £30,525,153. in the corresponding month of last year, an increase of £4,631,167. Our monthly tables and summary will appear next week.

Photography at the Polytechnic.—Special courses of instruction in photography have been arranged in connection with the Polytechnic, Regent-street, W., during the forthcoming session, which opens on Tuesday next, the 15th inst. The syllabus contains many features of interest. Instruction will be given in tri-colour work, the control of gradation, presswork, screen negatives (the apparatus for which, we notice, is supplied by Messrs. John J. Griffin and Son, Ltd., of Kingsway), bromide enlarging, portrait operating, re-touching, finishing, photo-engraving, etc.

Germany's Method of Promoting Trade in Foreign Countries.—United States Consul General Richard Guenther writes from Frankfort that the German Government is being heartily endorsed for sending experts to foreign countries to study trade conditions. At the convention of the Associated German Machine Builders the following resolution was adopted:—"This Association has noticed with great interest the recently published report of the commission of experts sent by the Imperial German Government to Roumania in order to study trade conditions of that country. This Association thanks the Imperial Minister for taking up this course of sending abroad experts for the purpose of benefiting German industries, and it prays that the Government continue this course." German trade papers in publishing the foregoing resolution also comment favourably upon this governmental move, and recommend that the Federal legislature annually vote grants for providing for the sending abroad of commissions of this kind.

THE NEW AUSTRALIAN TARIFF.

We give below a special abstract of those portions of the new tariff proposals of the Australian Commonwealth which are of interest to our readers. These proposals were introduced by the Federal Treasurer in the Commonwealth House of Representatives on August 8, and take effect from the date of introduction.

The proposed tariff provides for preferential rates on certain goods, the produce or manufacture of the United Kingdom, imported into the Commonwealth. The Australian representative in London points out that the tariff has yet to be considered by the Commonwealth Parliament, and that the present printed schedule cannot be accepted as final, as considerable alterations may be made during its progress through Parliament. Our abstract is prepared from a supplement to the *Board of Trade Journal* containing the full text of the tariff.

Tariff Items.	Old Rates. (British and Foreign Goods).	New Rates	
		General Tariff.	Tariff on Goods the Produce or Manufacture of the United Kingdom.
Amylic alcohol and fusel oil per gallon	14s.	14s.	14s.
Collodion .. .. per gallon	3s.	3s.	3s.
Spirits denaturated, or to be denaturated in accordance with departmental by-laws prior to delivery; and being not less than 65 o.p. .. per gallon	1s.	1s.	1s.
Sulphuric ether and other ethers, n.e.i. :—			
(*a*) Containing 5% and more of proof spirit, per proof gal.	14s.	14s.	14s.
(*b*) Containing less than 5% of proof spirit	Free	Free	Free
Glucose .. .. .. per cwt.	8s.	8s.	8s.
Invert sugar and invert syrup, including brewers' priming sugars .. .. per cwt.	10s.	6s.	6s.
Candles, tapers, and night lights :			
(*a*) Paraffine wax, wholly or in part .. .. .. per lb.	1d.	2½d.	2d.
(*b*) N.E.I. .. .. per lb.	1d.	1½d.	1d.
Stearine, paraffin wax, beeswax, and Japanese or vegetable wax per lb.	½d.	1d.	1d.
Canambria and ceresine per lb.	½d.	1d.	1d.
Mixed or compounded waxes, liquid or solid .. .. per lb.	Not tariffed.	1d.	1d.
Egg albumen, dry .. per lb.	6d. per doz.	2s.6d.	2s.6d.
Linseed .. .. per cental	2s.	2s.	2s.
Linseed for the manufacture of oil and cake under departmental by-laws	Free	Free	Free
Linseed meal .. per cental	4s.	4s.	4s.
Linseed cake & oil cake per cental	1s.	1s.	1s.
Matches and vestas of all kinds—			
(*a*) In boxes containing 100 or less of matches or vestas per gross of boxes	6d. per gross of boxes (each box containing 100 matches or vestas or part thereof)	1s.9d.	3s.9d.
(*b*) In boxes containing over 100 but not exceeding 200 matches or vestas per gross of boxes		3s.6d.	3s.
(*c*) For each additional 100, or portion of 100 matches or vestas per box, an additional duty .. per gross of boxes		1s.9d.	1s.6d.
(*d*) When in boxes with matter thereon advertising any commodity other than the matches contained therein, in addition to the duties set out in (*a*), (*b*), (*c*) above per gross of boxes		7d.	6d.

Tariff Items	Old Rates. (British and Foreign Goods.)	New Rates.	
		General Rates.	Tariff on Goods the Produce or Manufacture of the United Kingdom.
Copra	Free	Free	Free
Anatto, liquid and solid, in packages over 1 lb.	Free	Free	Free
Isinglass—			
(*a*) In sheets	Free	Free	Free
(*b*) N.E.I. .. .. ad. val.		15%	15%
Salt—			
(*a*) Brown or dark red rock..	Free	Free	Free
(*b*) N.E.I., including pink rock per ton	12s. 6d. per ton	20s.	20s.
Soap .. .. ad val.	Perfumed &c., 3d. per lb. Other kinds ½d. per lb.	25%	25%
Sparklets, for making aerated waters	Free	Free	Free
Starch, and dextrine .. per lb.	2d.	2½d.	2d.
Bags for salt, gypsum & manure	Not tariffed		
Lead, sheet and piping per ton	Free	50s.	50s.
Crucibles	Free	Free	Free

ELECTRICAL POWER FROM BLAST FURNACES.

THE provision of cheap electrical energy, from whatever source it may be derived, is a subject of great interest to manufacturers. In a paper read before the autumn meeting of the Iron and Steel Institute, held on September 23rd and 24th, at Vienna, Mr. B. H. Thwaite dealt with "The Economic Distribution of Electric Power from Blast Furnaces."

Mr. Thwaite observed that until recently, blast furnaces, where associated with steelworks and rolling mills, had never derived the full chain of possible benefits, owing to the fact that heavy rolling mills could not be electrically harnessed. The successful solution of this problem—due to the enterprise of Continental electrical firms—was a fact of great economic significance.

Before the date of the actual proof that waste gas from blast furnaces could be directly converted into power with an expenditure of seven to eight thousand British thermal units per indicated H.P., the waste of energy involved was a matter of indifference, as the waste of heat approximately balanced the supply; but now that it was known how valuable this gas had become, the waste of fuel was inexcusable. Unlike the blast furnace, the rolling mill may or may not remain steadily employed. During a non-operating period the blast furnace gas is set free or blown into the air. This waste of fuel may be cut down almost entirely by the application of the pooling system, which involves the displacement of steam by gas power. The objection advanced against this gas power electrification is the heavy expenditure it involves, and, unless removed as reduced, will confine the advantages of application to firms of immense financial resources. If, however, it can be shown that it is possible to reduce the capital investment to the amount necessary to provide the equipment of the new rolls with electric motors, as distinct from the electric generators, and that such an investment would be financially justified, the objection would be considered as of no deterrent consequence.

The basis of the programme is to pool the waste furnace gases from all the furnaces of an iron-making district independently of their ownership. The energy (electrically transformed) would be transmitted to a central distributing and transforming station, where the current would be transformed to the voltage required to satisfy different customers.

The first call on this power would, of course, be the satisfaction of the internal demands of the iron and steelworks, the balance of power remaining being available for external distribution over a wide area of yearly increasing extent. The proposed pooling programme would be provided by a separate joint-stock electric power organisation, except that a proportion of the output would be preferentially allocated to the satisfaction of the power demands of the iron and steelworks from which the gases were drawn. The balance could be transmitted to any group of customers whose power demands justified the cost of distributing mains, but a more appropriate field of demand for an all-the-year supply would be the satisfaction of the electric energy requirements of the many profitable electro-chemical and electro-fusion processes described by the author in a former paper. Amongst these processes are the production of high-class steel, special alloys, and carbides (silicon and calcium).

As an example of the kind of power demands that would be found in an average field of industrial operations, the following would represent a German district for which the pooling system was outlined:—For the coalmines in the district, 1,300 E.H.P.; chemical (metallurgical) requirements, 2,500; electro-chemical requirements, 1,500; works and town electric lighting, 500. In large districts, the power-driving requirements of the factories would provide a demand running into thousands of horse-power; by the pooling system, also, the tall stacks of furnaces would become centres from which would radiate the benefits of the cheap power, and the advantages would be reciprocated.

The flexible demand for power—the aim of the power organisation—would be appropriate for the intermittent periods of mill idleness. Another argument in favour of the pooling policy would be the fact that some four to five thousand kilowatts of energy was the minimum demand of many of the most desirable of the electro-chemical and other operations, so that in a single works it was impossible to secure this output of electric energy; whereas, by pooling the available power from several works, this power could be obtained with little change from existing conditions. The following table gives an impression of the power available from several works in a district, without any change of plant and operations, to secure the fullest possible economy of the waste gas:—

	Kilowatts available for external services.
District A, one furnace always available.. ..	1,490
District B, two furnaces	2,700
District C, one furnace	1,700
Total available	5,890

The axiom that unity is power could hardly be more appropriately demonstrated than by the pooling of the power from the furnaces of several works, which, individually, would be too small to justify the establishment of a central distributing station and its associated transmission mains.

The advantages of the pooling policy would depend largely on the individual circumstances of different works. During about 23% of the total hours of one week, the mills would be standing and the power waste during this idle period would be available. The change in the Board of Trade's attitude towards electrical transmission makes the pooling policy more economically desirable in England than it would have been when the Government department insisted that the electric main should be placed underground. Transmission by aerial cables means a reduction in cost—compared to underground transmission—of one-fifth. The following comparison, between the original proposition of 1892 and the state of affairs to-day, may be quoted as an example of the progress in power-generation and transmission systems:—

Year.	Unit power of gas engine.	Thermal efficiency.	Electric generators.	Pressure of transmission line.	Economic distance.
	Brake Horse-power.	Per cent.	Kilowatts.	Volts.	Miles.
1892....	300	20	1 500	20,000	100
1907....	3,000	30	10 000	88,000	250

The harnessing of the gas engine to the blast furnace resulted in the almost immediate increase of its unit power-capacity proportions. The author was prepared to design a 2,000 indicated horse-power single unit multiple cylinder blast furnace gas engine in 1899. The fly-wheel type of electric alternating current generators of immense capacity assisted in the gas engine increased power-unit evolution. The foregoing tabulated improvements all pointed in the direction of the policy of pooling or concentration of the power output. The pooling policy would eventually displace steam by gas-electric power for blowing and other furnace requirements, for driving the rolls in the mills, and for satisfying the general power requirements, and would lead to the suppression of all preventable wastes in the use of furnace gases.

To recapitulate the advantages of pooling. It would facilitate the electrification of the rolling mills by reducing cost of plant; it would secure an increase in the proportion of the furnace power gas; it would secure an all-round benefit to the iron-master and the power consumer, and tend to promote the establishment of new electrical industries; further, it would financially justify expenditure in apparatus and on technical changes to secure the fullest possible economy in the use of furnace gas in the works. With the exception of water-power, no other system of power generation is so economical to the ironmaster as the gas engine which, in association with a high-class generating machine, can develop the hours of a kilowatt year for 66s. 8d., assuming that no charge is made for furnace gas.

Nitrate Statistics.—The Permanent Nitrate Committee, in their public statistical circular for October, state the shipments of nitrate of soda as follows:—(1.) Total exports to Europe, September, 1,802,700 quintals. (2.) Imports, Europe, September, 52,880 tons. (3.) Deliveries, Europe, September, 58,920 tons. (4.) Visible supply, Europe, 1st October: Stocks and afloat, 406,910 tons.

Silicate Co., Ltd.—Registration has been made of two debentures dated September 17, 1907, to secure £1,000. and £1,600. respectively, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: F. Greaves, Molyneux, Wetherell, Hemel Hempstead, and A. Fielding, Stoke-on-Trent.

THE INDIGO MARKET.

THE United States Consul-General at Rotterdam, in discussing the course of the Dutch market, states that 1906 witnessed a strong rise in prices for Java indigo. The year's crop was a limited one, but, owing to most buyers only wishing to buy on sample, which can be done in the Dutch market, the demand was good. For the best quality "warm process of manufacture," $1.20 per half-kilo. was on one occasion paid. The first-hand supply was entirely sold off, while the lots which were still to be had from the second-hand supply could be disposed of at very profitable prices. The quality was good in 1906, and the assortment, considering the small offers, satisfactory. As the lots bought were exclusively destined for purposes for which the article could not be replaced, little or nothing was heard in 1906 of the artificial product; but even for these special purposes the lots bought on the market did not suffice; hence the arrivals of the new crop are awaited with great interest.

The indigo crop acreage in the East Indies has come to a standstill. Although the management of some plantations have deemed it best to stop the cultivation, others have, on the other hand, again commenced to plant. At present, 35 plantation enterprises produce indigo. The arrivals, sales, and supplies in cases during the last two years, compared with those of ten years ago, were as follows:—

Year.	Rotterdam.			Amsterdam.		
	Imports.	Sales and transit.	Supply December 31st.	Imports.	Sales and transit.	Supply. December 31st.
1897	4,062	3,211	2,165	5,180	4.774	1,576
1905	1,154	2,468	378	893	1 431	327
1906	610	988	..	425	752	..

After the small crop of Bengal indigo was sold in January at Calcutta at augmented prices, the article was for a long time influenced by reports that the next crop would be larger again owing to an increase of the cultivation. During the summer large inundations occurred, and owing thereto the crop did not amount to 40,000 maunds (maund = 82.14 pounds), as originally estimated, but to only 24,000 maunds, while the 1906-7 crop is estimated at about 28,000 maunds. The consumers, who had waited long before purchasing, bought in the fall in London, where lots could be regularly disposed of at increased prices and where the supply is now small. The December prices at Calcutta were for the good to the fine qualities of Bengal and Tirhoot indigo from 140 to 170 rupees per maund, which is equal to 80 cents to $1. per one-half kilo (1.1) pound delivered in Europe. The crops in British India in maunds were: In 1906, 24,000; 1905, 20,000; 1904, 35,000; 1903, 58,000; 1902, 43,100; 1901, 85,100; 1900, 111,700.

CINCHONA BARK.

WHILE the demand for cinchona was at the beginning of 1906 far from favourable, during the year the course of the market was better than expected. The great supply with which the year commenced was, with what was imported into Holland during the year from Java, mostly sold at satisfactory prices, and at the last two auctions the value of the unit was augmented by more than 1 Dutch cent ($0.004). The extraordinary large sales were due to the fact that consumers were in need of quinine. Nobody had confidence in the tendency of the market in 1905. It was felt that a change had to come, and everyone therefore bought as little as possible. When the fixed price limit was discontinued, quinine orders came in lively, and in the January auction of 1906 the bark could be sold at reasonable prices. A second cause, according to a United States Consular report, was that the Amsterdam quinine factory had retired from the convention and commenced to hold quinine sales. Quinine prices retrograded to a figure unheard of before. The first auction held in January opened with an average unit price of 1.6 cents, against 1.9 cents in the last auction of 1905. The price fluctuated during the year and closed at 1.72 cents. In 1906 there arrived 6,346 packages of Government and 68,141 packages of private cultivation, against 5,758 and 84,642 packages respectively, in 1905. In auction and otherwise were sold 93,049 packages (88,519 bales and 453 cases), weighing together 18,794,197 pounds, containing, according to analysis, 1,023,931 pounds of sulphate of quinine, while the figures for 1905 were 13,420,656 pounds of cinchona bark and 680,277 pounds of sulphate of quinine, and in 1904, 16,856,019 and 814,392 pounds, respectively.

From the cinchona bark sold in auction, 15,863,225 pounds were factory bark, containing 918,559 pounds quinine, and 2,386,058 pounds were pharmaceutical bark, containing 73,949 pounds of quinine. The average unit value was for factory bark, 1.724 cents per one-half kilo, against 2.885 cents in 1905 and 2.6 cents in 1904. The following quantities of the several kinds of cinchona bark were sold at auctions:

Description.	Cinchona bark.		Sulphate of quinine.	
	Government crop. Pounds.	Private crop. Pounds.	Government. Pounds.	Private Pounds.
Ledgeriana ..	1,447,008	11,097,260	—	—
Hybrides ..	—	3,289,110	—	825,524
Officinalis ..	11,517	14,817	93,036	—
Schuhkraft ..	3,502	—	—	—
Succirubra ..	248,813	2,137,245	7,075	66,873
	1,710,840	16,538,432	100,111	892,397

The cinchona bark shipments from Java were, from December 1, 1905, to November 30, 1906, 14,403,100 pounds, against 15,807,000 pounds in the previous twelve months. The first-hand supply of Java cinchona bark was at the end of the year: Government crop, 5,575 packages, and private crop, 15,061 packages. The prices of the Amsterdam quinine factory retrograded slowly from $6.80. and $8. to $4.90. and $6. per kilo (2.2 pounds) and were, at the end of the year, $6.10. per kilo for *Ed. II.* and $7.20. for *Ed. IV.* The Amsterdam quinine factory marketed in 12 auctions, in 1906, various lots of *Sulfas chinine Pharm. Germ. Ed. IV.* of which the *Ed. II.* was mostly sold easily, except in the auction of December 28, when the lots offered were not granted the highest bidder.

Continental Notes.

IN the *Chemiker-Zeitung* for September 25, F. E. Polzenlusz gives the results of investigations concerning the absorption of nitrogen by calcium carbide, and the manner in which the reaction is accelerated by the presence of other substances, such as calcium chloride. He finds that the only calcium compounds that are able to assist the absorption are those that contain no oxygen and have a comparatively low melting-point, and consequently are partly dissociated during the ignition. Other halogen compounds, such as those of the alkalies and iron, only act by forming a certain proportion of the corresponding calcium salt. He considers it probable that the calcium of the halogen salt first forms nitride, and that this is afterwards converted into cyanamide.

In the same issue, P. Philosophoff describes a method for the analysis of electrolytic chlorine, chloride of lime, and bleaching liquor. The chlorine is first determined in the gaseous mixture by absorption with metallic mercury, and the carbon dioxide is then estimated in the usual way by measuring the diminution of volume on treating with caustic potash. The method is very rapid and satisfactory.

A. Ricevuto gives the results of an analysis of the metal used for the construction of the pans of the Hartmann and Benker concentrating plant for sulphuric acid. This is stated to be an alloy of iron and manganese, but the author finds that it is an alloy of iron and silica, containing 9.24% Si, 0.526% P, and 0.80% S. It is very little attacked by boiling 92% sulphuric acid. It also resists the action of nitric acid fairly well, but is somewhat affected by hydrochloric acid.

The recent improvements effected in colour photography by the brothers Lumiére form the subject of a communication by Dr. G. Hauberrisser. The advantage of the process is that only one plate is required, instead of three, as in the three-colour process. These auto-chromatic plates are prepared by first laying on them a layer of starch granules, some of which are coloured green, some blue, violet, and some red. The granules must be equal in size, and must cover the glass without lying one over the other, an object which is accomplished by pressing. Any interspaces that still remain are filled with a black powder. This starch layer is protected with a coat of varnish, and then a very thin panchromatic silver bromide emulsion is applied. The plate is exposed with the glass side towards the lens, and in order to correct the greater sensitiveness of the silver bromide

Digitized by Google

to violet and ultra-violet rays a special yellow screen is used. This plate is developed and treated with special solutions, so as to convert the negative into a positive. When finished, the natural colours are seen in all their brilliancy, and the plate can be used as a transparency or a lantern slide. It has not yet been found possible to make satisfactory prints on paper. It is very important that the time of exposure of the plate be correct.

In the same issue of the *Chemiker-Zeitung*, and the next one, for September 28, Dr. A. Salmony treats of the manufacture of white lead by the Bischof process, as carried out at Brimsdown. Although he admits the ingenuity and comparative healthiness of this method of manufacture, he does not consider that it can be made remunerative. He gives details of the various stages of the process: the conversion of the pig lead into oxide, the reduction of the higher oxides to Pb_2O, the hydrating of the oxide, its conversion into basic oxide by means of carbon dioxide, and the grinding of the white lead with oil. Diagrams are given of some of the plant employed.

In the issue of September 28 there is also a note by A. Steinmetz, on the production of acetic acid. In view of the high price of acetate of lime, he recommends its preparation from maize malt. This is subjected to fermentation, and the alcoholic liquid thus obtained is converted into vinegar in the usual way by acetic fermentation; this is then neutralised with lime, and any unconverted alcohol is distilled off. The recovered alcohol is returned into the process, and the acetate of lime solution is evaporated to dryness. The product obtained is very superior to the ordinary grey acetate of commerce, as it is free from empyreumatic substances, and contains 90 to 95% of calcium acetate, according to the purity of the lime used. The acetic acid is then made by distilling with sulphuric acid. The author claims that under present conditions this process is considerably cheaper than manufacturing from commercial grey acetate.

In the issue of October 2, Dr. Anton Seyda discusses the present state of modern chemical cleaning and its hygienic importance. The use of benzine and benzol for cleaning articles of clothing has led to the creation of an important industry, and this has been further helped by the discovery of a soap readily soluble in the benzine. The addition of this greatly increases its solvent power, and has the further advantage that it decreases the danger of fire through electrification.

GRAPHITE PRODUCTION.

ONE of the United States Consuls in Canada says:—One of the most important electrical industries at Niagara Falls, Ontario, manufactures graphite from anthracite coal and petroleum coke, and converts into graphite the forms of raw carbon used in electric furnace work, where high temperature is required, and for electrolytic work, such as the manufacture of caustic soda, bleaching powder, etc. The raw materials used consist of anthracite coal, glass sand, foundry coke and sawdust, all of which are imported from the United States, except the sawdust.

The furnaces used for the conversion of the coal are in the form of long, narrow troughs, built of fire brick and lined with some suitable refractory or insulating material. In this case the sand, coke, and sawdust are used for insulating, by mixing them together in the proper proportions. At the end of each trough is a terminal built of carbon rods, to which is connected the cables conveying the current. The trough is filled with anthracite coal, in which is embedded a carbon rod to make electrical connection between the terminals, as the coal is a poor conductor of electricity. The temperature to which the coal is raised before conversion into graphite is very high—approximately 7,500° F.—a temperature at which all bodies except carbon are vaporised and driven off.

The graphite can be made practically chemically pure, but for ordinary commercial purposes such a high degree of purity is unnecessary, but it is possible to so regulate the operation that a degree of uniformity of purity is attained which is not possible to secure in the production of natural graphites. When the furnace has cooled sufficiently the graphite is removed, but it is not yet in commercial form and has to be ground to powder and finally separated into the sizes necessary for the various uses to which graphite is put.

During the year 1906 upward of 454,311 pounds of graphite were manufactured, the greater part of which was exported to the United States. The demand in Canada, though steadily growing, has not warranted the construction of a complete grinding factory such as would be necessary to make all the forms and grades ordinarily required in the trade. This graphite is not a mined product, and in comparison with the production thereof the quantity mined in Canada is surprisingly small, the report for 1905 showing that only 541 short tons were mined, valued at $17,032., while the value of artificial graphite for 1906 was $21,579.

WOLFRAM.

[FROM A MINING CORRESPONDENT.]

THE Carrock Mines, near Mungrisedale, Cumberland, have been sold to the Cumbrian Mining Co., Ltd. The same company have acquired several other old mines on the Caldbeck Fells, which have been repeatedly worked by a number of companies, chiefly for lead, blende, and copper. The Carrock Fell Mines are now raising wolfram, and also scheelite. The ore was tried some years ago by Mushet, the inventor of the Mushet or self-hardening steel. The demand for wolfram and scheelite is increasing, and the Tasmanian mines are now exporting larger quantities to the Continent and elsewhere. Discoveries are also reported on the Tugela, Rhodesia, and in New South Wales. Nova Scotia, Cobalt (Canada), and Minnesota are also producing the ores. Meantime the demand is ahead of supplies.

Cornwall and Devonshire are being explored, and in both counties valuable deposits are probable. The Cornish mines have produced the ores associated with tin, but until the last ten years steel manufacturers and other consumers were sceptical as to the benefits of the self-hardening steels. Mushet considered himself hardly dealt with by the Sheffield steel workers. His inspection and experiments with the Carrock ores were not satisfactory, and it is very probable that the analysis was misrepresented. At any rate, Mushet wrote adversely as to its phosphoric contents, which he considered prohibited its use. The more recent analysis is stated to show a very rich ore, free from phosphorus and sulphur, and remarkably high in acid. The new company are putting down plant to deal with the ore, which is found in the quartz.

Carrock Fell is partly Gabbro and Syenite, and upon the Fell 27 metallic and non-metallic ores are found. The district has been mined for hundreds of years, but until recently the ores of wolfram were unworked. In the Eskdale range prospecting for wolfram is in hand, and rich ores are stated to have been found. The deposition is erratic, and, like plumbago, there is frequently no "leads" or "strings," or other indications, the vein often "nipping out" and the ground being completely barren.

THE VAL DE TRAVERS ASPHALTE PAVING CO. announce an interim dividend at the rate of 5% per annum (6d. per share) for the six months ended June 30.

THE ANTIMONY MARKET.—A correspondent of the *Glasgow Herald* says:—"A smart turn for the better has become manifest in the market for antimony, the value of which was in recent months severely depressed. The price of English refined, which at one period stood at £35., has recovered to about £45. per ton. The improvement in the demand has been pretty general, exception made perhaps of the United States, whose stocks are credibly still plentiful. Should demands from that quarter develop to any notable extent this would of course help a further recovery, while the present price may be regarded as comparatively low. The chief inquiry lately has been for Germany, especially Hamburg, which is rather peculiar, since merchants there who months ago nursed stocks acquired at very high prices lost a good deal of money owing to the adverse course of the market. Crude antimony has risen to a corresponding extent, being now worth about £30., while offers from Japan and elsewhere are restricted. So far as Europe is concerned there is now no more question of unwieldy supplies, although Hamburg is again holding fair quantities both of crude and ores. English regulus is in fact scarce and now not offered under £45. by the chief refiners. Certain dealers who were so keen in depressing the market in the summer now appear to be rather short. Last year the price touched £125., so that the big drop has undoubtedly checked production, at least where low grade ores were treated in South America. Consumption as in some other metals may be more restricted than last year, but it is believed that during the late depression consumers' reserve stocks were allowed to run very low, which would now make for an increasing demand on the rise. There is a great scarcity of raw material, which is partly responsible for the recovering tendency, good ore, running 50%, being held for £14. per ton."

Reports of Companies.

ASSOCIATED PORTLAND CEMENT MANUFACTURERS, LTD.

Presiding at the annual meeting of shareholders, held on the 27th ult., Mr. E. A. White said that the use of cement had increased, partly in consequence of the disasters in America. This had had a double effect. Not only had a larger amount of cement been shipped from this country, but the shipments to America from Europe had somewhat diminished the competition which British cement encountered in the markets of the world. He wished he could say that the home trade had been equally stimulated, but that was not the case. The building trade in this country was diminishing, but two directors had been to Canada and the United States, and opened up new business. Another director had been to Egypt, with good results, and another had gone to live permanently on the Pacific coast. The gross profits for the past year were £403,524., and this, after deduction of £138,619. for repairs and renewals, left a sum larger by £28,000. than last year. The directors had come to the conclusion that the strengthening of reserves was the clear duty of the company, and this course they urged on the shareholders as being in their best interests. They had a net sum of £180,092. to deal with, after depreciations and reserve, and proposed, after paying the final preference dividend, to carry forward £36,208., which was £23,656. more than last year. There was reason to expect a return of the past keen competition, and it was well to be prepared. All cement users and makers were prepared for higher prices.

The report was adopted.

CENTRAL CHILI COPPER COMPANY, LTD.

The report states that during the period under review, while high prices have ruled for copper, the company has been obliged to contend against rising prices in coal and coke, and for practically all the other commodities employed in its business. Exceptional difficulties have confronted the management owing to the continual scarcity and high price of labour. It was anticipated that this situation would be relieved by the despatch in December last to the property of some 300 Spanish miners. This experiment has not, however, yielded satisfactory results owing to the desertion of many of the miners, who were attracted to the nitrate fields in the north of Chile, where the economic conditions permit of paying a higher rate of wage than is possible at the company's properties. The Chilian Government is fully alive to the necessity of encouraging immigration, and there is reason to believe that the company's requirements in the near future will, at least, be partially met by miners recruited and brought to Chili at the expense of the Government. The profit for mining and smelting has, notwithstanding these adverse conditions, amounted to £32,467. Of this sum, after making provision for depreciation, interest on debentures, London expenses, etc., £24,202. has been carried forward to the accounts of the current year, and on May 31 there was paid a dividend, on account, of 5%, or 1s. per share, amounting to £15,623. The directors propose to carry the available balance of £8,578. forward. During 1906 just over 43,000 tons of ore were smelted for a return of regulus containing 1,857 tons of fine copper. The gold and silver recovered during the year were valued at £7,118. As in past years a large proportion of the copper produced was derived from ores purchased from the neighbouring mines at prices varying in proportion to the London prices for standard copper. The properties yielded 19,000 tons of ore of 3.86% copper, while there were purchased 24,200 tons of ore containing 7.42% copper. The quantity and grade of ore from the company's own mines and of the ores purchased having amounted to about the same as in 1905, the increased profit for 1906 has resulted partly from the higher price of copper which has ruled during the year, and partly from a more efficient management at Panulcillo. The realisable assets of the company on December 31, 1906, represented by stocks, debts due to the company, cash in hand and at bankers, and copper sold but not yet cashed, amounted to just over £100,000. Of the original debenture issue of £25,682. there now remains undrawn only £8,075., the whole of which it is anticipated will be paid off early next year, thus leaving the company free from encumbrance and in a position to apply its net earnings to the payment of regular dividends. None of the unissued shares which were under option have been called, and the options have now expired, while the issued capital remains at 312,468 shares.

FOLDAL COPPER AND SULPHUR COMPANY.

The report from January 27, 1906 (the date of registration) to February 28 last, states that the company has been engaged in equipping and developing the property. The ropeway, which is 21 miles in length and is capable of conveying 120,000 tons a year without being unduly worked, has been completed. The harnessing of the waterfall and the erection of the electric plant have been carried out, and the installation has worked satisfactorily. On account of the requirements of the buyers of the class of ore produced at the mine, who are mostly manufacturers of sulphuric acid, it is necessary to arrange contracts a long time before delivery, and during the past year the directors have given their careful attention to this matter, so that contracts have been arranged on satisfactory terms for almost the whole production of 1907, a considerable part of 1908, and some of the production of the following two or three years. With regard to the progress which has been made since February 28, the following particulars are given in the report :—Produced to date, approximately, 31,000 tons; shipped to date, approximately, 27,000 tons. The average of ore shipped, as per agreed assays to August 31, is :—Copper, 2.09%; sulphur, 48.12%. During the year a considerable amount of unexpected outlay had to be met, so that the directors some time ago realised that the working capital which was guaranteed and paid up was not sufficient, and they therefore issued a further 10,000 of the preferred ordinary shares at par, giving the option to the subscribers to call up to 30,000 of the remaining preferred ordinary shares at any time before February 28, 1909, at par.

NORTH BROKEN HILL MINING COMPANY.

For the six months ended June 30 last, the accounts of this company show a profit balance of £59,740. The directors have written off £16,224. for depreciation, and during the half-year two dividends were paid amounting to £42,000. The liquid assets of the company stand at £61,050. The mill treated 53,433 tons of ore, producing 9,327 tons of concentrates, the recovery of metal being, lead 75%, silver 54.6%, and zinc 9.2%

RIO TINTO CO., LTD.

The interim report states that the deliveries of pyrites in the United Kingdom have this year again been rather below those of former years; the Continental consumption is, however, higher than that of 1905 or 1906. The copper content of pyrites shipped to all markets has been about the same, while the consumption of non-cupreous sulphur ore is in excess of the previous year. The great and unprecedented drought in Spain has been a very serious anxiety to the board, and it was only by taking extraordinary measures that the company was able to continue all its operations. An additional reservoir is in course of construction. The output of copper, of course, suffered somewhat from the scarcity of water, though much less than might have been expected, and it is now hoped the year's output of fine copper at the mines will not fall short of 1906 by more than from one to two thousand tons. The board have no adverse news to convey to the shareholders regarding mining or other operations, all of which are in a satisfactory state. The price of copper was very high during the first few months of the year. In May and June, however, a crisis in financial affairs in America disorganised business generally, and consumers have since then not been purchasing as freely as formerly, a severe fall in the price of copper being the consequence. This company's output is, however, fairly well sold in advance, and the fall in the price of the metal will probably in itself have the effect of preventing any general over-production in the future. The directors now declare, out of the estimated profits of the year, a dividend for the six months ended June 30 of 2s. 6d. per share, less tax, on the preference shares, and an interim dividend of 47s. 6d. per share, free of tax, on the ordinary shares, both payable on November 1.

DIVIDENDS.

The British Aluminium Company announce an interim dividend of 3½%.

Salar del Carmen Nitrate Co.—The directors have declared an interim dividend of 20s. per share on account of profits for the current year.

The Neuchatel Asphalte Co. declare an interim dividend on the ordinary shares of 3s. per share, free of income tax.

California Oilfields, Ltd.—An interim dividend of 15%, payable (free of tax) 15th October, is announced.

Our Book Shelf.

Denatured or Industrial Alcohol. By R. F. Herrick. Pp. 516. New York: John Wiley and Sons. London: Chapman and Hall, Ltd. 1907.

The subject of industrial alcohol is evidently attracting serious attention in the United States. In our last issue we noticed Mr. Brachvogel's work, in which he deals very fully with the German practice. Mr. Herrick's book, now before us, also presents an exhaustive summary of the present position as regards alcohol for industrial purposes and the methods of manufacture. In his preface, Mr. Herrick refers to the scarcity of literature dealing with this branch of technology; the publication of the present volume, together with that reviewed in our last issue, will to some extent remove this difficulty.

During 1906, the United States Congress passed regulations permitting the general use of tax-free domestic alcohol, suitably denatured, for industrial purposes (light, heat, and power production). This enactment, which took effect on January 1st, 1907, has created a widespead interest in the subject. Mr. Herrick represented the American Chemical Society and the Society of Chemical Industry (through their New England Sections) at the so-called "Free Alcohol" Congressional hearings, held at Washington last year. During these investigations much valuable evidence was given, and this is dealt with in the present volume. The author has also drawn freely upon the Report of the British Departmental Committee on Industrial Alcohol, issued in 1905.

The author has had the assistance of various well-known chemists in the preparation of portions of the work, and, as many aspects of the subject require treatment by specialists, this co-operation adds additional interest and value to the volume under review.

In Chapter I. the composition, history, and use of denatured alcohol is considered. Chapter II. treats of the manufacture of alcohol generally, and includes descriptions of the raw materials; their composition and preparation for fermentation; malting; the fermentation proper; theoretical *versus* practical yields of alcohol; the micro-organisms; the use of moulds in saccharification; the fermentation period; wild and "disease" yeasts; the control of the fermentation operations; and the conditions favourable to alcoholic fermentation. Chapter III. deals with the distillation and rectification of alcohol; and Chapter IV. with alcoholometry. This latter section, containing 46 pages, is of special interest. The determination of alcohol by the alcoholometer and by distillation is described, and also the detection and determination of ethyl and methyl alcohols in mixtures by means of the immersion refractometer, together with the determination of methyl alcohol in denatured alcohol by the same instrument. Alcohol tables are given, and also tests for the detection of acteone, methyl alcohol, and ethyl alcohol. In this chapter is illustrated a small hot-air motor for laboratory purposes, driven by denatured alcohol. Chapter V. deals with the cost of alcohol and of alcohol-distilling plants. The calculation of the cost of alcohol from different raw materials is dealt with at some length. Other subjects discussed in this chapter are the by-products obtained in the distillation process; fusel oil; the value of the spent wash; the manufacture of ethyl alcohol from sawdust; ethyl chloride as a refrigerant; and the cost of buildings and plant for distillation, with a plan of a distillery for distilling alcohol from corn, etc. Chapter VI. is devoted to the question of alcohol as an illuminant, and in Chapter VII. the fuel value of alcohol is compared with other liquid fuels. Alcohol as a source of power is treated of in Chapter VIII., and this section, consisting of 50 pages, is of special interest at the present time, when substitutes for petrol are being sought for use in connection with motor vehicles. Chapter IX. contains details of the laws and regulations for denatured alcohol in the United States and other countries; while in Chapter X. the author reviews the question as to the possibilities of industrial alcohol in America. The appendix of over 120 pages contains the text of various United States regulations; amendments to the Act of Congress already referred to; the text of the Report of the British Departmental Committee of 1905, with extracts from the minutes of evidence; an abstract from the British Revenue Act, 1906; a bibliography; and a list of patents referring to the manufacture of alcohol.

The work is a valuable contribution to the technology of the subject, and will form a useful addition to the library of the technical chemist.

The Twentieth Century Book of Recipes, Formulas, and Processes. Edited by Gardner D. Hiscox, M.E. Pp. 787. London: Crosby Lockwood and Son. New York: The Norman W. Henley Publishing Co. 1907. 12s. 6d. net.

Collections of recipes are so familiar to the technical reviewer that he is apt to look with suspicion on any new compilation. The Editor of the present collection pertinently observes in his preface that an ideal work of this character would include only formulas and recipes which have been carefully tested, and all chemists will agree with him in this dictum. He goes on to add, however, that this precedure is impracticable, as the cost of carrying out chemical and technological tests of several thousand processes places such a course out of the question. The next best method is the selection of recipes from trustworthy sources, and this system has been adopted in the preparation of the present volume. The book contains nearly 10,000 selected recipes, formulas, and processes for use in the laboratory, the workshop, and for domestic purposes. It is above the level of many such compilations, and covers a very wide range of subjects.

Trade Notes.

The Fall in the Price of Platinum.—Advices received in St. Petersburg from Ekaterinburg show that platinum has again given way in price. It is now quoted there at 20 kopecks reduction per solotnik, or about 6 roubles to 6r. 20c. per solotnik.

Cornish Mines Association, Ld.—Capital £20,000., in 19,900 preference shares of £1. each, and 2,000 deferred shares of 1s. each. This company has been formed for objects as indicated by the title.

Portland Cement.—The Lower Elbe Cement Manufacturers' Syndicate announces an advance in selling prices for next year's deliveries of 30pf. per barrel, equal to 2.56m., or 2s. 6d. per ton. It is to be hoped that English manufacturers may be able to follow suit, thereby improving their present purely philanthropic position. The Hanover Portland Cement Company pays a dividend of 15% for the year ending June 30, against 10% for the corresponding period.

Fuel Oil on Mexican Railways.—The Mexican Central Railway is now taking 4,000 barrels of fuel oil daily from the Mexican Petroleum Company. The cost is $1.10. a barrel, or a total of $4,400. daily. The Mexican Central is steadily increasing the number of oil-burning engines in service, and within the next few months the road will be taking much more fuel oil than at present. All new engines purchased by the Mexican Central are equipped for burning oil, and engines are being constantly remodelled in the general shops at Aguascalientes. Oil-burning engines will be soon placed in service on the Chihuahua and Guadalajara divisions of the Central. Storage tanks are being prepared at Guadalajara, Yurecuaro, Zapotlan, and La Vega, and delivery tanks are now being erected.

Motor Fuels.—In a recent volume of American Consular reports, Consul Halstead, of Birmingham, observes that amongst substitutes for petrol are mentioned crude petroleum, paraffin, shale oil, benzol, alcohol, and acetylene, some of which are said to give better results in connection with another hydrocarbon. Both paraffin and crude petroleum are unsatisfactory, the former because it is difficult to start a paraffin engine from the cold, the latter because of its heaviness. Shale oil is difficult to obtain, but gives good results. Alcohol and acetylene have been combined experimentally for motor-fuel purposes with some degree of success, but the difficulty is in ascertaining what should be the relative proportions of the two ingredients. This combination cannot become commercially useful in the United Kingdom for motor purposes until alcohol can be produced much more cheaply. The high Inland Revenue tax now keeps up the price of alcohol, though it can be produced very cheaply from many substances of little value. If alcohol alone were used for internal combustion engines, the design of such engines would have to be changed to ensure complete combustion. The difficulty in starting an engine from alcohol from the cold can be overcome by using either a vaporiser or a burner, or a small quantity of petrol in the initial stages. Benzol is regarded as the alternative fuel most likely to aid in the solution of the question. It is thought that it can be manufactured in sufficient quantities and sold at a fair price if the demand arises for it. It is more powerful than petrol, and experiments made with it are said to have been most encouraging.

Analytical Notes.

A METHOD OF ESTIMATING CAUSTIC LIME BY THE USE OF A SUGAR SOLUTION.*

By James Hendrick, B.Sc., F.I.C.

Methods of estimating rapidly and accurately the caustic lime in burnt limes and other substances are not given in the ordinary text-books, and do not appear to be in common use. In the past, analyses of lime have generally been "complete" analyses, in which the caustic lime has been determined by estimating the total lime and certain other constituents of the sample, and assuming that the lime which is left after subtracting from the total what has been calculated to be present in certain compounds is caustic lime. This direct method is liable to great inaccuracy. For instance, a considerable amount of lime is sometimes present as silicate in burnt limes. It appears to be common to include such lime in the caustic lime. It is probable that estimations of caustic lime in this way are generally in excess of the truth, especially in the case of impure limes prepared from limestones which contain a considerable percentage of fine siliceous matter. In any case, such a complete analysis is usually not wanted, and is time-consuming and troublesome. In recent years, ground lime has come greatly into use for agricultural purposes. The purchasers of this do not require a complete analysis, but only an estimation of the caustic lime, hence it is largely sold on a caustic lime basis. It is quite common for sellers—in Scotland, at any rate—to give a guarantee that ground lime contains a certain percentage of "caustic lime" or "calcium oxide." In view of the provisions of the Fertiliser and Feeding Stuffs Act, 1906, it is necessary for agricultural analysts to be prepared to estimate caustic lime.

The amount of calcium oxide present in a mixture of the oxide with calcium carbonate can be estimated by direct titration with standard hydrochloric or nitric acid, using phenolphthalein or phenacetolin as indicator (Sutton, "Volumetric Analysis," eighth edition, p. 75). In the case of commercial limes this method is rendered only approximately accurate by the presence of magnesia, of phosphates, and of iron and aluminium oxides, which render the end-point indefinite. With experience, an approximate estimation can be made in this way which is probably as accurate as those made by the complete analysis method, and, like it, errs on the side of excess. This method has been used to a large extent in comparison with the one to be described (see Table V.).

Methods in which solutions of ammonium nitrate are used to extract caustic lime are employed to some extent on the Continent. G. Berju and W. Kosinenko (*Landw. Versuchs. Stationen*, 1904, 60, 419) investigated these, and suggested some improvements. One great defect is that a solution of ammonium nitrate dissolves calcium carbonate to a certain extent. Another is that the lime cannot be estimated volumetrically directly after extraction, but must be precipitated as oxalate.

It occurred to me that the lime might be extracted by a solution of ordinary sugar, and directly titrated in such a solution by standard acid. After I had commenced work on these lines it was pointed out to me that a method similar in principle had already been published by W. E. Stone and F. C. Scheuch (*Journ. Amer. Chem. Soc.*, 1894, 16, 721; *Analyst*, 1895, 20, 19). I have, however, as the result of my experiments, made certain alterations in the procedure of Stone and Scheuch, which materially enhance the value of the process.

The solubility of calcium carbonate, crystalline and amorphous, in a sugar solution was first determined, and it was found that neither was more soluble in a cold neutral sugar solution than in distilled water. A neutral solution of ordinary white loaf-sugar (10 grammes to 100 c.c.) was used in this investigation.

In my experiments with pure lime and carbonate of lime, Iceland spar, and what was purchased as pure precipitated carbonate of lime, were used. The Iceland spar was practically pure calcium carbonate, but the precipitated carbonate, after drying, contained only 98.9% of calcium carbonate. Lime and mixtures of lime and carbonate were prepared by heating these substances over the blowpipe. The amount of caustic lime present was estimated from the loss of weight after ignition, and by complete titration with standard acid and methyl orange.

The solubility of calcium oxide in presence of calcium carbonate was studied. For each gram of the original carbonate of lime taken, 100 c.c. of a 10% solution of sugar was used. After the carbonate had been ignited, it was shaken with the sugar solution for at least four hours in a Wagner rotary shaker. It was then rapidly filtered and titrated with standard acid. The results are shown in Table I.

In the case of Iceland spar, the agreement between the estimated and found calcium oxide is as close as could be expected. In all caustic lime estimations, unless special precautions are adopted to exclude carbon dioxide, there is a small loss due to the formation of carbonate. For the purpose in view, such minute losses are of no consequence, as they will in any case be less than those which are liable to occur in the commercial handling of the lime.

With precipitated lime the agreement is not so good, differences occurring which are by no means negligible. It was found that the "pure" precipitated lime contained about 1% of silica, which, on ignition, enters into combination with a part of the lime, and prevents its solution in the sugar. This helps to explain what takes place in the case of commercial limes, which often contain considerable percentages of silica.

Table I.—*Iceland Spar.*

Calculated from loss of weight: Calcium carbonate. Gramme.	Calcium Oxide. Gramme.	Found by titration of Sugar solution: Calcium oxide. Gramme.
1.000	0	Mere trace.
0.777	0.189	0.187
0.301	0.451	0.488
0.020	0.549	0.547
0.010	0.555	0.557
Precipitated Calcium Carbonate.		
1.000	0	Mere trace.
0.534	0.341	0.325
0.044	0.535	0.517

Strength of Sugar Solution.—The effect of the concentration of the sugar solution was investigated. For this purpose a high-grade commercial lime, of which a complete analysis had been made, was used. In each case 5 grammes of lime and 500 c.c. of the sugar solution were taken. The solutions were shaken side by side for four hours. The results are given in Table II.

Table II.

Strength of sugar solution	100 c.c. required N/1 HCl.	Calcium Oxide.
5 per cent.	24.5 c.c.	0.6860
10 ,, ...	29.5 ,, ...	0.8260
20 ,, ...	29.6 ,, ...	0.8288
30 ,, ...	29.7 ,, ...	0.8316

The figures show that whilst 5% of sugar is too low a concentration, there is little difference in the results obtained from the stronger solutions.

Amount of Shaking Necessary.—In the method described by Stone and Scheuch it is recommended that the lime be shaken with the sugar solution for twenty minutes. I have not found this sufficient for complete extraction. Experiments were made with two samples of commercial lime, one of high quality and the other of poor quality. These were finely powdered and shaken with a 10% sugar solution, 100 c.c. per gramme of lime, for different lengths of time, as shown in Table III.

Table III.

Time of shaking.	High-quality lime. 100 c.c. required N/1 HCl.	High-quality lime. Per cent. CaO.	Low-quality lime 100 c.c. required N/1 HCl.	Low-quality lime Per cent. CaO.
½ hour	.. 29.8 c.c.	.. 83.44	.. 21.2 c.c.	.. 59.36
1 ,,	.. 30.3 ,,	.. 84.84	.. 21.7 ,,	.. 60.76
2 hours	.. 30.8 ,,	.. 86.24	.. 22.0 ,,	.. 61.60
4 ,,	.. 31.0 ,,	.. 86.80	.. 22.3 ,,	.. 62.44
6 ,,	.. 31.0 ,,	.. 86.80	.. 22.3 ,,	.. 62.44

The results show that about four hours' shaking is necessary. The shaking machine was driven at about 50 or 60 revolutions a minute. If the limes are at all coarse and lumpy, it has been found that four hours' shaking is not sufficient. At the same time, no special precaution was taken to grind very finely, and they were certainly not ground to an impalpable powder.

It is most important that the shaking should be started immediately after the lime and sugar solutions are mixed. If they are allowed to stand the lime soon forms a cake of sucrate, and it is then almost impossible to obtain complete extraction. There were many erratic results obtained in some of our earlier experiments owing to this cause. The high-quality lime used in the time experiment mentioned above was allowed to stand till it had caked and then shaken. The effect of the caking is shown in Table IV.

* A paper read before the Society of Public Analysts.—From the *Analyst*.

Digitized by Google

Table IV.

Time of shaking.	100 c.c required standard HCl.
½ hour	22.2 c.c.
1 ,,	25.2 ,,
2 hours	27.0 ,,
4 ,,	28.2 ,,

Even after four hours' shaking there was less lime extracted than in half an hour when the shaking was commenced at once. If 2 c.c. of alcohol per gramme of lime is placed in the flask before adding the lime and sugar solution the formation of a cake is prevented.

Effect of Magnesia.—A sample of crystallised magnesium carbonate of the composition—MgO, 31.1%; CO_2, 31.5%; and water, 37.1% was used. It was free from lime, sulphates, chlorides, and nitrates. Five grammes of the finely powdered carbonate were shaken for four hours with 500 c.c. of a 10% sugar solution, and filtered; 100 c.c. required for neutralisation hydrochloric acid equal to 0.0866 gramme $MgCO_3$, equal to 0.0412 gramme MgO. The shaking was continued in another portion for six hours, but exactly the same amount of acid was required for neutralisation. Magnesium carbonate in this form appears to be dissolved to a considerable extent by the sugar solution. A portion of the carbonate ignited to oxide was shaken with a similar sugar solution for four hours. The sugar solution was used at the rate of 100 c.c. per gramme of the original carbonate taken. It required for neutralisation only 0.3 c.c. N/1 HCl per 100 c.c., equal to 0.0059 gramme MgO, or 0.0123 gramme $MgCO_3$. The oxide, therefore, is almost insoluble in sugar solution. A similar result was found by Stone and Scheuch.

It is generally assumed that all the magnesia in burnt limes is present in the form of oxides. If this be so, the small percentage present in ordinary lime will not affect the result to any appreciable extent.

This method, therefore, furnishes a rapid means of estimating caustic lime in such substances as burnt limes, which contain carbonate of lime, magnesia, and other substances. It is more accurate than the method of direct titration, which is interfered with by the presence of magnesia and carbonate, and gives high results, and is also more accurate, as well as much less troublesome, than the method of complete analysis.

The process which I use in carrying out the sugar method for ordinary burnt limes is as follows:

In a 500 c.c. flask is placed 10 c.c. of alcohol. Five grammes of the powdered lime are rapidly weighed and added. The flask is filled to the mark with 10% sugar solution, and at once placed on the shaker, and shaken for at least four hours. A portion is then rapidly filtered into a 100-c.c. flask, and titrated with standard hydrochloric acid, using methyl orange as indicator. When the residue readily settles clear after the shaking, as is often the case, the solution can be poured off directly into the 100-c.c. flask. Table V gives the results of some typical estimations of lime by this method in comparison with direct titration.

Table V.

Caustic lime. By direct titration.	Caustic lime. By sugar extraction.	Total lime.	Total magnesia.	Total silicon.
49.5	48.8	—	—	—
57.5	54.7	71.9	1.6	14.8
67.2	66.0	76.5	5.5	5.5
75.5	75.5	—	—	—
79.1	78.3	—	—	—
84.9	82.4	88.0	5.1	2.4
86.8	85.2	90.1	2.2	1.2

It will be seen that in every case but one the direct titration gives higher results than extraction by sugar. In four of these limes complete analyses were made, and the total lime, magnesia, and silica found are also given in the table for comparison.

When the caustic lime was calculated from the complete analysis, it was always found to be higher than that given by the sugar method, and generally also higher than that found by direct titration. In the case of low quality limes which contain a considerable percentage of silica, it is not unusual to find that the caustic lime estimated from the complete analysis is from 5 to 10% higher than that found by the sugar method, unless it is assumed that a considerable part of the lime was combined with silica and this amount deducted.

I have to thank Mr. F. S. Marr, B.Sc., for assistance in carrying out this investigation. Most of the routine experimental work was performed by him.

THE CAMPHOR SITUATION.

In recent issues (*C.T.J.*, No. 1,061 p. 265, and No. 1,062 p. 288), we published some notes on the camphor situation. The latest volume of United States Consular reports contains further contributions to the subject, of which the following is an abstract.

Camphor in Formosa is manufactured only from trees of about fifty years of age. Recent investigations have shown that the supply of trees will, at the present rate of cutting, become exhausted in less than fifty years. Owing to lack of roads and the presence of savage tribes, much of the camphor forest is inaccessible for exploitation. In the Daito Prefecture alone there are enough trees to produce 40,000,000 lbs. of crude camphor. A few years ago a Japanese company took 1,000 coolies into this district to exploit the camphor forests, but 33% of its labour was incapacitated through the contraction of fevers. Most of the camphor comes from trees in the Toen province. The Camphor Bureau expects to produce 5,000,000 kin (6,667,000 lbs.) of crude camphor, and about half that amount of camphor oil during the present year. Formosa at present produces about 75% of the world's supply of camphor, the remainder coming from Japan and China.

On the organisation of the camphor monopoly in 1899, the Formosan Government adopted a system of afforestation which, it is hoped, will guarantee to the island a constant supply of raw materials. The Camphor Bureau has three methods of afforestation: Government replanting; replanting by schools, villages, and agricultural societies, and replanting by private concerns. Furthermore, the Bureau registers certain of the seed-producing trees and prohibits their being cut down, thus preserving a good supply of seeds. Since 1900 the Government has planted about 3,000,000 young trees, and will add another 500,000 during the present year. After that they expect to plant 750,000 each year. Trees in the mountainous districts are not allowed to be used for production for a period of fifty years. Those in the lowlands are planted close together in rows, so that, in ten years, they can be utilised for crude camphor.

Of the two varieties—the camphor-producing tree and the camphor-oil producing—the former is the more valuable, as the latter only produces 0.49% of its weight in camphor. The afforestation of camphor in Formosa is flourishing, reports from Japan estimating the number of trees planted during the past ten years at 8,000,000.

Crude camphor is manufactured from the wood by the simple process of distillation. Chips of camphor wood are placed in a clay-plastered retort which rests upon a circular wooden rim of a water pan. This water pan sets over a fire. Connected with the retort at some distance away are the crystallisation and cooling boxes in which the camphor vapour passes, is cooled, and crystallised. The camphor thus crystallised is dark in appearance and is known as crude camphor. These stills or stoves are erected as close to the supply of the raw material as is possible; hence, throughout the camphor-producing districts there are found many of these stoves. The products of the different stoves are not uniform in quality. There are two grades of camphor, known as "B" and "BB." The "B" grade, exported to the American market, is rated crude camphor, containing a higher percentage of oil and water than the "BB" grade, which more nearly approaches a refined camphor. The "BB" grade differs from properly refined camphor in that it is not clarified. Owing to the fact that the Monopoly Bureau's plant was partially destroyed by fire a few months ago, it has been impossible to produce the "BB" grade, and consumers are obliged to take the "B" grade product until the plant is repaired. The crude camphor which is not exported to foreign markets is sent, along with the camphor oil, to the Kobe refineries, where refining is completed. Although the "BB" grade is rated by the American customs examiners as a refined camphor, yet the Camphor Bureau in Formosa terms it crude camphor, for the reason that a clarifying process is necessary to the completion of the refining.

Formosa holds a monopoly upon the production and sale of camphor. Although 1,600,000 lbs. were exported in 1906 from China, yet the Formosan industry fears no competition from that source. About 70% of the world's camphor is used in the manufacture of celluloid; the Formosan Camphor Bureau has instructed its agents to supply the celluloid manufacturers first. The Monopoly Bureau regulates the prices to be made to foreign purchasers; the present price of the "B" grade camphor is $69.50. U.S.A. gold, for 133⅓ lbs., f.o.b. New York. This is considerably higher than the price of five years ago, but there will probably be no advances in the future.

Digitized by Google

The following are the official statistics of the Japanese camphor industry for the last three years, a kin being 1.325 pounds avoirdupois, and a yen 49.8 cents :—

Year.	Camphor.	Camphor oil.
	Kin.	*Kin.*
1904	—	3,434,689
1905	4,102,362	3,417,531
1906 (estimated)	4,185,906	3,484,387

About 90% of the whole production is exported to foreign markets to be wrought upon and distributed. The value of the commodity imported into Japan during the past six years in the form of celluloid (sheet and rod) is as follows :—

Year.	Yen.	Year.	Yen.
1901	383,516	1904	253,643
1902	275,939	1905	496,865
1903	339,499	1906	818,122

The productive capacity of Japan is stated as follows :—

	Camphor	Camphor oil.
	Kin.	*Kin.*
Formosa	32,000,000 ..	22,360,000
Japan proper	32,235,000 ..	34,290,000

The Monopoly Bureau is now encouraging the cultivation of camphor trees, with a view to maintaining the productive power in the staple commodity. A Japanese newspaper states that the Tokio Government has on foot a project for the extensive planting of forests of camphor trees. The demand for camphor increases, having now reached over 10,500,000 pounds annually, and it will not be long until it reaches 13,0000,000 pounds, says the Japanese authority.

CHINA.

It is only in the past few years that China has taken to the production of camphor. During 1906, 1,467,000 lbs. were exported. The exports were :—From Fuchau, 1,515,867 lbs. ; Santuao, 15,600 lbs. ; Wuchow, 41,800 lbs. ; total 1,573,320 lbs. These exports went to Hong Kong, whence they were re-exported to Europe and America. The prices in Fuchau varied from $134. to $170., Mexican, per 133⅓ lbs. The trees in the Futsin Province are very scattered, and, in spite of reckless cutting, a goodly number still remain. Of the possibilities of the Chekiang, Kuansung, and Kuangsi Provinces but little is known ; ; nevertheless, the camphor industry in China has made remarkable progress during the past few years. Consul S. L. Gracey, of Fuchau, makes the following report on the trade.

Camphor is being exploited by the Chinese, Japanese, and British, who are ruthlessly cutting down the trees as fast as they can be bought from the owners. There are no camphor forests in this district, but there are great numbers of trees scattered all over the northern part of the Province. New rules have recently been issued by the Viceroy, in which it is proposed to impose a provincial tax of 76 cents on every 133⅓ lbs. of camphor produced, and 28 cents on each 100 lbs. of camphor oil, which it is calculated will produce a revenue of from $8,300. to $11,450., which sum is to be expended in planting and cultivating new trees. Some provision of this kind is absolutely necessary, else the camphor product here will soon be a thing of the past. Five young trees are to be planted for every tree cut down. As the Viceroy says, " Camphor trees cannot produce camphor unless they are several tens or hundreds of years old," it will be seen that as a fact the product will soon cease, as a long interval must elapse between the destruction of the existing trees and the growth of the new trees to a state fit to be cut. There are about twenty distilleries now in operation near Fuchau, and many more up the country where the trees are grown. Of exports the greatest increase has been in the shipment of camphor from Fuchau, as the following table will show :—

	Camphor.		Campho oil.	
Years.	Pounds.	Gold value.	Pounds.	Gold value.
1904	161,333	$47,102	167,333	$10,305
1905	538,267	223,954	221,733	14,855
1906	1,516,600	932,793	425,200	42,078

FRANCE.

Consul W. H. Hunt observes that the growth of the celluloid industry has caused the formation of companies to manufacture camphor artificially. After many experiments the chemist Kindt obtained, by the action of hydrochloric acid on essence of turpentine, a crystallised product which he took for camphor, and gave the name of artificial camphor, although this product has but little practical uses. Synthetic camphor, on the other hand, is found in the market, and is well adapted to the manufacture of celluloid. Natural camphor is called " Japan camphor," 90% of which comes from Formosa. Japan's production of camphor is about 3,000,000 to 4,000,000 kilos. (kilo 2⅕ lbs.) Of this fully 1,000,000 kilos. are exported to Germany and delivered at $109. per 220 lbs.

The outlook on trade, though good, is not without disadvantages. The first is the high price of essence of turpentine and its derivatives. For the last six years the prices have gone up from $13. to $20. per 100 kilos., and they continue to rise. The second consists in the fact that the celluloid industry is endeavouring to do without camphor by substituting for it casein. In any case it is certain that if the Japanese Government finds that synthetic camphor is becoming a serious competitor, and consequently compromising the market for the natural article, it will lower the price of camphor (the margin allows it) even below the cost price of the foreign manufacturers.

UNITED STATES.

The Secretary of the Department of Agriculture, in a recent address delivered before the Americus Club, of Pittsburg, stated that the United States were successfully experimenting in the production of camphor. For years the Department had been distributing camphor-tree seed, and thousands of trees were now growing throughout the South and in the Pacific coast States. Two years ago a serious effort was made to develop the manufacture of camphor from these trees. By improvements in manufacturing processes satisfactory results had been accomplished, and a large manufacturing concern was now building up a camphor grove of 2,000 acres in Florida, from which it hoped to make its camphor. This firm used more than $500,000. worth of camphor every year.

Answers to Correspondents.

We cannot undertake to reply to correspondents through the post. Those of our readers who have addressed queries to us should look in this column for a reply.

A. & H.—Your query has been replied to by post.

S. B. & Co., Ltd.—The blocks have been returned.

H. W. & Co.—You would notice a reference to the change in our last week's issue.

S. & Co., Ltd.—We have written you by post respecting the points you mention.

G. L. & Co., Ltd.—The four blocks are duly to hand. We expect to publish the article next week.

J. N. & Sons, Ltd.—We are looking into this matter, and hope to be able to refer you to the foreign journals respecting which you inquire.

J. P. & Co.—We are not acquainted with any firm who make a speciality of the plant you mention. We will, however, try to secure the desired information.

A. D.—Any of the firms specified under " Acid, Carbolic," in the Chemical Trade Directory will be able to supply you with the products respecting which you inquire.

P. Le M. & Co.—We scarcely think it is possible for you to secure complete information. The names given are often those of transit agents, and not of the actual importers. The " Chemical Trade Directory," published at this office, will help you.

A. C. E.—We think you will find all the information you require in Sutton's " Volumetric Analysis," published by J. and A. Churchill, New Burlington-st., London, and Abady's " Gas Analyst's Manual " (E. and F. N. Spon, Ltd.), 125, Strand, London, W.C.

B. & Co., Ltd.—Full particulars, both as to weight and value, are always given in our export lists when such appear in the Customs returns ; when the value only is stated, the reason is that this is the only available information. We are looking into the matter of exports of carbonate of ammonia, and hope to secure a more satisfactory classification.

The Patent List.

This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of G. Keville Davis, who reports professionally upon the value of Chemical Patents.

APPLICATIONS FOR BRITISH LETTERS PATENT.

Cleansing Material. H. Robb, W. A. Mullen, and A. Garnett. 21,043. September 23.

Refining Crude Petroleum, etc. W. McMullen. 21,060. September 23.

Dry Concentration of Ores. H. M. Sutton, W. L. Steele, and E. G. Steele 21,063. September 23.

Extracting Metals from Ores by a Wet Process. J. Moeller. 21,066, 21,067. September 23.

Fuel Gas from Mineral Carbonates. C. H. Ryder. 21 078. September 23.

Steam Superheaters. E. H. Foster. 21,093, 21,094, 21,095. September 23.

Regulating Temperature of Superheated Steam. E. H. Foster. 21,096. September 23.

Steam Superheaters. L. B. Nutting. 21,097. September 23.

Colouring Matters of the Gallo-Cyanide Series. G. B. Ellis. 21,109. September 23.

Explosive Oil. H. J. Haddan. 21,116. September 23.

Explosive Oils Containing Nitro-Glycerine. H. J. Haddan. 21,117. September 23.

Gas-producing Apparatus. G. Marcoonet. 21,124. September 23.

Consuming Smoke. G. H. Biddles. 21,129. September 24

Sulphuric Acid. F. G. Cottrell. 21,147. September 24.

Separating Solid Granular Materials from the Containing Liquid. E. Bennis, A. W. Bennis, and T. Scott-King. 21,204. September 24.

Ozonising Apparatus. J. T. Szek. 21,211. September 24.

Cyanamides and Nitrides from Nitrogen and Carbides of Metals. G. Bredig and W. Fraepkel. 21,215. September 24.

Boron. British Thomson-Houston Co., Ltd. 21,224. September 24.

Fire-resisting Material. J. Bearn and P. Spence and Sons, Ltd. 21,239. September 25.

Filtering Device for Laboratory Work. J. Hudig. 21,279. September 25.

Nozzles for Bunsen Burners. A Lines. 21,315. September 26.

Packing Materials for Reaction Chambers, etc. H. Petersen. 21,346. September 26.

Diazo Compounds. A. R. Fiechter. 21 366. September 26.

Centrifugal Machines. A. L. Adams. 21,388. September 26.

Recovery of Metallic Tin. O. J. Steinhart and J L. T. Vogel. 21,401. September 26

Conveyers. D. Campbell, R. B J. Binnie, and W. Reid. 21,425. September 27.

Distilling Tar, etc. W. Welsh and J. Duffy. 21,427. September 27.

Sulphuric Acid Manufacture. L. P. Basset. 21,475. September 27.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 8d. *in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery-lane, W.C.*

1906.

Hydro-oxygen Gas Apparatus. Lang and Smith. 16,351.

Treatment of Zinc Residues. Macivor and Fradd. 21,440.

Separation of Zinc from Ores or Compounds. Sulman. 21,672.

Evaporating Apparatus. Grossmann. 23,606.

Anthracene Series Compounds. Johnson (Badische Anilin and Soda Fabrik) 29,750.

1907.

4-Nitro-2-Chlorodiphenylamine and its Derivatives. Bloxam (Akt.-Ges. für Anilin-Fabrikation). 1,946.

Tanning Extracts. Stewart. 5,438.

Furnace Smoke Consumers. Johnson. 6,335.

Waterproof Paints. Plönnis. 6,755.

Pulverising or Grinding Mills. Fuller. 7,143.

Electrodes for Resistance Furnaces. Rochling, Schoenawa, and Rodenhauser. 11,917.

Purifying Gases from Pyrites Burners. Eschellmann and Gesellschaft Der Tentelewschen Chemischen Fabrik. 12,213.

Steam Generators for Gas Producers. Ransford (Pierson and Firm of J. and O. G. Pierson). 14,531.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in and relating to the Extraction of Metals from Ores. J. J. C. Fernau, c/o G. Fernau and Son, 21, Wool Exchange, London, E.C., and of Nelson, British Columbia. British Patent, 24,905. November 6, 1906.

The claims of this specification are :—(1.) A process for separating metals from sulphide ores, consisting in reducing the ore in a bath of a suitable molten metal circulating between the heating and work chambers, and subsequently isolating the reduced metal by distallation, precipitation, or other method depending on the character of the metal. (2.) A process for separating zinc from its ores, consisting in reducing zinc blende in a bath of molten iron circulating between the heating and work chambers, the work chamber having a relatively inert atmosphere and recovering the zinc volatilised during the reaction by condensation. (3.) A process for separating zinc and lead from zinc blende and like ores, consisting in reducing the blende in a bath of molten iron circulating between the heating and work chambers, the work chamber having a relatively inert atmosphere, recovering the zinc volatilised during the reaction by condensation and the lead by precipitation. (4.) The improved process for the extraction of metals from ore. (5.) An apparatus for carrying out processes of the type indicated, in which molten iron from a furnace or other source is caused to circulate through an air-tight chamber and separate metal from ore introduced therein, the volatile products arising from the reaction of the molten metal and the ore being conducted through a mass of incandescent carbon and afterwards condensed. (6.) In apparatus of the type indicated, means for circulating molten metal between the work chamber and the heating chamber. (7.) Improved apparatus, substantially as described with reference to the drawings accompanying the specification.

Process for Calcining the Raw Material for Manufacturing Cement. Carl Hocke, Gr. Bäckerstrasse 6, Hamburg. British Patent, 27,059 November 28, 1906.

The inventor claims :—(1.) Process for calcining, in kilns or shaft furnaces, raw material for cement, in which the raw material is supplied to the furnace intimately mixed with finely divided combustible, the mixture being in the wet condition characterised by such a quantity of water being supplied on the press to the raw material during the production of blocks of the same, that said blocks on being thrown into the furnace lose their shape again and subside into a cake filling up the whole cross-sectional area of the furnace. (2.) Process for calcining in kilns or shaft furnaces raw material for cement in which the raw material is supplied to the furnace intimately mixed with finely divided combustible, the mixture being in the wet condition and in which cement slurry obtained by the wet preparative process is for the purpose of being supplied to the furnace without being preliminarily dried, thickened by the addition of half-burnt cement, characterised by said half-burnt cement being added in a finely ground condition, so that the slurry with this addition and with the requisite amount of combustible can be supplied to the furnace in a dough-like condition.

Improved Process for Obtaining Metallic Zinc and Apparatus therefor. W. P. Thompson, 6, Lord-street, Liverpool (communicated by G. Mojana, 37, Via Manzoni, Milan. British Patent, 28,575. December 14, 1906.

The inventor observes that it has been proposed to submit refractory sulphides to the action of jets or sprays of chlorine or of chlorine and hydrocarbon vapour at a high temperature, and afterwards to that of liquid metals, so as to extract the precious metals therefrom ; also to purify solutions containing chloride of zinc by means of zinc oxide ; also to electrolyse chloride of sodium and treat certain ores at a high temperature with both its constituents to obtain aluminium or other metal whose chloride is less exothermic than that of sodium. By the present invention, however, the zinciferous substance is acted upon by gaseous chlorine in the presence of porous carbon in certain determined conditions whereby the zinc contained can be almost totally transformed into a soluble compound (chloride) which is separated out by lixiviation, and after which the solution may be subjected to electrolysis to separate out the metallic zinc.

The process may thus also be applied to calcined and uncalcined calamine, blende, smithsonite, zinc ashes, concentrates, and tailings. For this purpose, charcoal, or coke obtained from the distillation of coal, peat, lignite, and wood, is used, and is broken into small particles. It must be intimately mixed with the zinciferous substances and preferably wetted a little before mixing. The temperature must generally be above 75° C. Chlorine is at first absorbed in considerable quantity, the absorption then grows less rapid, and becomes very slow. During the operation carbonic acid, oxide of carbon, and the chlorine not absorbed are given off from the mass. For this reason the apparatus for working the process has been so designed as to compel the gases given off from the mass, which has been almost completely treated, to pass through another mass only slightly treated. Chlorine is thus all absorbed and the gases are set free in the atmosphere. According to circumstances it is well to inject together with the chlorine (but only at intervals) a jet of steam. A sheet of drawings shows the apparatus employed.

RUSSIAN CHEMICAL MARKETS.

THE chemicals market at Kieff has remained quiet all through the summer months. The demand has been quite normal, except as to disinfectants, which have lately been more widely inquired for owing to the cholera epidemic.

Spirit is in short supply at Odessa, where prices consequently rule firm, but the situation is weaker for future deliveries.

A chemical report from Warsaw, whilst observing that no decided change is to be recorded in the market, adds that it is generally noted that in a series of items there is a slight tendency to weaken.

Market Reports.

TAR AND AMMONIA PRODUCTS.

FRIDAY.

Benzols quiet, at 9d. for 90's, and 8¾d. for 50-90's. Crude tar, 15s. 6d. to 19s. 6d. per ton, Thames; 1½d. to 1⅝d. per gallon, delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Solvent naphtha, 90-190%, 1s. 1½d. to 1s. 2d.; 90-160%, 1s. 2d.; 95-160%, 1s. 3d. to 1s. 3½d. Refined naphthalene, £6. 10s. to £8. 10s. Toluol, 90%, 10d. to 10½d.; pure, 1s. 8½d. Carbolic acid, crude, 50%, 1s. 5½d. to 1s. 5¾d.; 60%, 1s. 8d.; 75%, 1s. 11¾d. to 2s.; crystals, 39-40, 5⅝d.; 34-35, 5½d. Cresylic 95%, 1s. 1d. to 1s. 1½d. Anthracene, 40 to 45 per cent. A, 1½d. to 1¾d. Pyridin, 4s. to 4s. 3d.

Sulphate of ammonia steady. Nearest values are:—Beckton, October-December shipment, £12. 2s. 6d.; and January-April, £12. 5s.; Beckton terms, £11. 12s. 6d.; London, £11. 13s. 9d. to £11. 15s.; Hull, £11. 15s. to £11. 10s. 3d.; Liverpool, £11. 17s. 6d. to £11. 18s. 9d.; Manchester, £11. 15s.; Leith, £12. to £12. 2s. 6d.; January-April, £12. 5s.

Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 9d. Liverpool ordinary, 11s. 3d., and refined, 11s. 4½d. Official quotations:—Cargoes, off coast or due, 11s. 1½d.; ditto, for prompt shipment, 11s. 5½d.

FERTILISER MATERIALS.

FRIDAY.

The tone of the market, both for phosphatic and ammoniacal material continues very firm, and for the latter an advance in price has been realised.

For shipment, East Indian bone meal is very firmly held, at £5. per ton, nett cash, c.i.f. Liverpool; whilst the quotations on spot remain £5. 5s. to £5. 10s. per ton, according to quality, ex store.

Nitrate of soda is quiet but steady, at 11s. 3d. per cwt., for 95% quality, and 11s. 6d. per cwt. for refined, on spot.

There is no change to report in mineral phosphates, the quotations for all grades being fully maintained in all positions.

The demand for miscellaneous nitrogenous manure material continues very good, all available parcels being readily taken up at full prices.

THE LONDON METAL MARKETS.

THURSDAY.

Copper: Standard brands, £62. to £62. 5s. cash, and £61. to £61. 5s. three months. Tin: G.M. quality, £149. to £149. 10s. cash, and £146. 5s. to £146. 15s. three months; English, £151. Lead: Soft foreign, prompt £20. 7s. 6d., and November shipment, £19. 10s.; English, £21. Spelter, ordinary brands, £21. 15s. to £21. 17s. 6d.; hard, £18. 10s. f.o.b. Antimony, £43. to £45.; ore, £14. Bismuth, 6s. 6d. Quicksilver, £7. 10s.; seconds, £7. 9s. Nickel, 1s. 10d. per lb. Wolfram, 40s. to 41s.

MISCELLANEOUS CHEMICAL MARKET.

THURSDAY.

There is a good all-round demand for the main products of the alkali trade, and prices have a higher tendency. Caustic soda is firm at the recent advance. Ammonia alkali, 58%, steady at £4. 10s. on rails. Bleaching powder, softwoods, is unchanged at £4. 5s. to £4. 7s. 6d. for spot, and £4. to £4. 2s. 6d. for next year's delivery. Chlorates are quiet at 3½d. per lb. Sulphate of copper is meeting with very little demand, and prompt quotations are only nominal at £22. 15s. to £23. f.o.b.; £22. 10s. is quoted for spring shipment. Saltcake firm at 42s. 6d. per ton, but so far not much forward business has been done. Recovered rock sulphur, £4. 10s. f.o.r. Spot; supplies of potash, caustic and carbonate, continue scarce and dear. Prussiates are a little firmer for prompt, at 5¾d. and 3¾d. respectively for potash and soda; quotations, however, for 1908 delivery are somewhat lower. Lead salts are unaltered in position or value. White powdered arsenic continues in good request, and price is firm at £31., Garston, for best brands. Acetate of soda £17. to £17. 5s., c.i.f. American brown acetate of lime quiet at £8. 5s., c.i.f.; grey firm at £12. 10s., both prompt and forward. Oxalic acid still in short supply and price steady at 3¾d. delivered.

Digitized by Google

LIVERPOOL DRYSALTERIES.

THURSDAY.

Montreal potashes quiet, with quotations nominal. Pearl ash quiet. Logwood and fustic steady. Cutch quiet. Gum Copal: Sierra Leone sold at auction, at 9d. to 1s. 11d. per lb.; and Gold Coast 55s. per cwt. Castor oil steady at 3½d. for good seconds Calcutta, 3¼d. for first pressure French, 3¼d. for second pressure French, all on spot, and 3⅜d. for Calcutta shipment on to January next. Gambier: Block 21s. 6d. per cwt. on spot, and October November shipment 19s. 3d. Cubes: 30s. per cwt. on spot, 28s. 1¼d. for September-October, 28s. to 28s. 1¼d. for October-November and November-December shipment. Shellac steady at 147s. 6d. to 150s. for fair T.N. orange on spot. Glucose: American liquid, 43%, 12s. 6d. on spot, and 12s. for October-December delivery; for prompt shipment, 10s. 3d.; and October-December, 9s. 9d., c.i.f., for shipment. American powdered starch, 10s. 9d. on spot, and 10s. 3d., c.i.f., for shipment; pearl, 10s. 3d. on spot, and 9s. 9d. c.i.f., for shipment. Cream of tartar: 98% foreign powder, 85s. to 86s.; 95%, 83s. to 84s. Tartaric acid: English, 11¼d. on spot, and foreign 11d. Citric acid quiet, English, 1s. 9¼d. to 1s. 10d.; foreign, 1s. 9½d. to 1s. 9¾d.

LIVERPOOL OIL AND COLOUR MARKET.

THURSDAY.

OILS.—Palm oil firm, sales including Grand Bassa at £25. 15s. on spot; Dix Cove, £25. 15s. on spot; Saltpond, £26. 7s. 6d. Hard oils, £26. 17s. 6d. for October shipment.; Benin, £27. 7s. 6d. on spot; and Lagos, £30. 10s. on spot. Linseed oil firm at 26s. 9d. to 27s. 6d. per cwt. for Liverpool makes in export casks. Cottonseed oil steady, at 28s. 3d. to 29s. for Liverpool refined in export barrels. Tallow steady at 32s. 3d. per cwt. for South American mutton. Turpentine steady at 39s. per cwt. on spot. Petroleum quiet at 6¾d. for Russian and Roumanian, and 7¼d. to 8¼d. for American refined oils. Petroleum spirit in fair demand, at 1s. 0½d. to 1s. 3d. per gallon.

COLOURS.—Red lead, English, £21. 10s., white, £22. 10s. to £22. 15s.; emerald green, 1s. per lb.; Brunswick green, 16s. to 45s. per ton; venetian red, lump, 7s. 6d., powder, 5s. to 6s. 6d. per cwt.; vermilion, English, 2s. 4d., China, 3s. per lb.; Prussian blue, 1s. 10d. to 2s. 6d. per lb., Brunswick, 28s. to 34s. per cwt.

HULL PAINT, OIL, AND COLOUR REPORT.

THURSDAY.

OILS.—The positions as regards linseed andcotton seed oils during the week have completely reversed. Cottonseed oil, instead of being strong, has lost value by about £2. per ton, and linseed oil is 15s. per ton higher. Rapeseed oil is too high in price to attract much business. Cottonseed is easier forward, and linseed 6d. per quarter dearer, the huge supplies being absorbed for the continent. Amongst the principal imports here to date, as against the same time a year ago, have been:—Wheat 3,228,463 qrs., against 3,157,037 qrs.; flour 160,379 cwts., against 281,510 cwts.; linseed 616,136 qrs., against 470,021 qrs.; rapeseed 98,328 qrs., against 87,858 qrs.; cottonseed, Egyptian, 133,752 tons, against 120,527 tons; other kinds 137,902 tons, against 104,085 tons; oilcake 20,369 tons, against 31,808 tons; hemp 102,374 cwts., against 126,090 cwts.; olive oil 3,661 tuns, against 3,087 tuns; tar, 10,613 brls., against 10,600 brls. Amongst the weekly imports are:—Lard 4,815 cwts., margarine 2,649 cwts., sugar 13,966 cwts., glucose 37 cwts., hides 313 cwts. colours 1,949 pkgs., hemp 2,170 cwts., wool 28,408 lbs., oilcake 350 tons. Exports: Oil 9,346 cwts., colours 2,941 pkgs., chemicals 2,649 pkgs. Linseed oil firm at the advance, closing steady, 24s. 9d., naked spot; October-December, 23s. 10½d.; January-April, 22s. 10½d.; boiled and refined, £1. to £1. 10s. per ton extra. Exports: 1 ton Denmark, 6 France, 7 Germany, 17 India, 10 Norway, 1 Russia, 3 Turkey, total 45 tons. Refined cotton oil, naked, 25s.; October, 24s.; November-April, 22s. 10½d.; casks £1. and barrels £1. 10s. per ton extra. Exports: 35 tons Germany, 11 Holland, 1 Norway, 2 Sweden, total 49 tons. Turpentine quiet, spot 38s. 6d.; November-December, 39s. 6d.; January-April, 40s. 6d.; May-June, 39s. 9d.; Russian, 21s. Rosin quiet, from 10s. 6d. Castor oil, extracted here, November-December, £30. 10s. for firsts. January-March, 30s.; April-June, £29. 15s.; July-December, £29. 10s.; seconds, £1. per ton less. Olive oil, Levant, £39. to £40. per tun. Linseed, La Plata, spot, 45s. 6d.; October-November sold 45s. 10½d.; December-January sold 44s. 6d.; January-February sold at 44s. Cottonseed, spot, £7. 10s. on passage (new), £6. 18s. 9d. accepted November-January. Bombay, October-November, sold £6. Rapeseed, December-January, Jamba, sold at 43s. 7½d.

TYNE CHEMICAL REPORT.

THURSDAY.

Market steady, with a good demand; prices unaltered. Caustic soda, 70%, £10. 5s. and 76-77%, £11. per ton. Soda crystals, locally, £3. to £3. 2s. 6d. per ton gross weights. Bleaching powder steady at £5. to £5. 5s. per ton. Sulphur scarce at £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £29. 10s. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—Market quiet, the collieries are holding well to their prices, tonnage, however, is rather scarce and tends to interfere with shipments, while there is a certain amount of coal offering cheaper from second hands. For prompt shipment quotations are as follows:—Best Northumbrian steam, 15s. to 16s. per ton; second qualities, 14s. 3d. to 14s. 6d. per ton; small coals, 10s. 6d. to 11s. per ton; best gas coals, 15s. to 16s. per ton; Durham bunkers, 13s. 9d. to 14s. per ton; coking coals, 14s. 6d. to 15s. per ton; household coals, 16s. 6d. to 17s. 6d. per ton; gas coke, 20s. per ton; foundry coke, 23s. to 24s. per ton.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, THURSDAY.

The calico printers of this quarter are getting rather busier, supplies of cotton coming in a little more freely. The dyers, also, in all of the sections, report something more of movement. Colour chemicals and drysalteries generally continue to hold very well on the market, with a fair turnover, and with late values firm. Bichromate of potash and bichromate of soda, home makes, move steadily at the old values, 3½d. and 3d. respectively. There is no change in the heavy chemicals, which continue in fair movement at late figures ruling. The feeling in sulphate of ammonia, f.o.b., Leith deliveries, is a shade firmer; as although spot business is the same as before, forward inquiry gains force, buyers having now offered up to £12. 2s. 6d., while sellers want £12. 5s. In Scottish mineral oils and paraffins the late firmness is maintained, and 865° gravity of lubricant runs a further fraction higher.

Chief prices current are:—Alum (in lump), £5. 5s. to £6., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2⅞d. nett, f.o.b. Glasgow); bleaching powder, 35-37%, £4. 12s. 6d. to £4. 17s. 6d., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76%, £11.; 70-72%, £10. 5s.; 60-62%, £9. 5s.; and cream, 60-62%, £9. 5s., all nett, Liverpool; chlorate of potash, 3½d., nett, Glasgow; creosote (ordinary coal-tar and blast-furnace), 2¼d. to 2½d., naked, f.a.s. Glasgow; nitrate of soda, 11s. 4½d.; paraffin scale, hard, 2d. to 2⅛d.; and soft, 2⅛d. to 2½d. per lb.; paraffin wax, 120° semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¾d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating), 865°, £5. 15s. to £6. 5s.; 885°, £6. 7s. 6d. to £7. 7s. 6d.; 890-895°, £7. 2s. 6d. to £8. 2s. 6d.; prussiate of potash, 5⅛d. to 5⅜d. nett, f.a.s. Glasgow; salammoniac, first and second white, £42 and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £3. to £3. 2s. 6d.; sulphate of ammonia, £12. to £12. 1s. 3d., prompt f.o.b. Leith; sulphate of copper, £23, less 5% Liverpool, prompt.

New Companies.

Alaknunda Copper Syndicate, Ltd.—Capital £6,750., in 600 A and 6,000 ordinary shares of £1. each, and 3,000 deferred shares of 1s. each. This syndicate has been formed to adopt an agreement with R. M. Nash for the acquisition of a certain mining license and the right to a lease of property in Devangur, British Garhwal, United Provinces of Agra and Oudh, India, and to carry on the business of copper and general miners, etc. No initial public issue. Table A mainly applies. Registered office, 20, Bucklersbury, E.C.

Banteng (Selangor) Rubber Estates, Ltd.—Capital £50,000., in £1. shares. This company has been formed to acquire the Banteng and Puchong Rubber Estates, Selangor, Federated Malay States, and to adopt an agreement with the Puchong Rubber Syndicate, Ltd. Minimum cash subscription, £15,000. The first directors are R. F. McNair Scott, A. W. Stiven, V. R. Wickwar, and L. C. Bernacchi. Qualification, £250. Remuneration, £500. per annum, divided.

British American Cotton Oil Co., Ltd.—Capital £35,000., in £1. shares (5,000 5% preference). This company has been formed to adopt an agreement with P. A. Mitchell and A. J. Parrott, and to carry on the business of oil merchants, commission agents, factors, etc. No initial public issue. The first directors are A. J. Parrott and P. A. Mitchell (both permanent). Special qualification, five ordinary shares. Qualification of ordinary directors, three ordinary shares. No remuneration. Registered office, 58, Margaret-street, Regent-street, W.

British Colour Co., Ltd.—Capital £15,000., in £1. shares. This company has been formed to purchase the business and assets of the British Colour Co., of Glasgow. The first directors are W. Grieve, W. Eaglesham, J. McLellan, W. J. Newlands and R. Roxburgh; qualification 200 shares. Registered office, 102, Bath-street, Glasgow.

Coslett Anti-Rust Syndicate, Ltd.—Capital £10,000., in £1. shares. This syndicate has been formed to develop and work British patents relating to a process for the treatment of iron or steel for the preventing of rust. No initial public issue. The first directors are not named. Qualification, one share. Registered office, 19 and 20, Temple Courts, Temple Row, Birmingham.

Peruvian Amazon Rubber Co., Ltd.—Capital £1,000,000., in £1. shares (300,000 preference). This company has been formed to acquire the rubber estates at Iquitos and Manaos, South America, owned by the firm of Julio C. Arana and Hermanos, and known as Colonia Indiana, El Encanto Argelia Pevas and Nanay, with the business carried on by the said firm at Iquitos and Manaos, and all other property appertaining thereto. The preference shares are entitled to a cumulative preference dividend of 7%, and to 20% of any surplus profits available for distribution, after providing for 7% on the ordinary shares. No initial public issue. The first directors are to be appointed by the subscribers. Remuneration, £200. each per annum (£300. for the chairman).

Posoltega Rubber Estates, Ltd.—Capital £30,000., in £1. shares. This company has been formed to acquire the rubber estate known as the Chiquimulapa Rubber plantation, on the West Coast of Nicaragua, to adopt an agreement with the Lothbury Syndicate, Ltd., etc. Minimum cash subscription, seven shares. The first directors are H. Lawrence, J. E. A. Dick Lauder, G. V. A. Schofield, E. L. Simon and P. R. Boyes. Qualification, £200. Remuneration for first two years, £50. each per annum; afterwards £100. per annum (chairman £50. extra) and 10% of the surplus net profits after 10% is paid on the ordinary shares, divided (all original shares appear to be ordinary). Registered office, Blomfield House, 85, London Wall, E.C.

Synthetic Rubber Co., Ltd.—Capital £100,000., in £100. shares. This company has been formed to adopt an agreement with F. W. Kinyon and L. Gottschalk, and to carry on the business of manufacturers of and dealers in rubber, guttapercha, balata, and similar substances, dealers in synthetic rubber, etc.

PRICES CURRENT.

FRIDAY, October 11, 1907.

PREPARED BY MESSRS. HIGGINBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified.
The price in different localities may vary.

		£	s.	d.
Acids :—				
Acetic 25% and 40%	per cwt.	9/-	&	13/-
,, Glacial	,,		40/-	
Arsenic S.G. 2,000°	,,		32/-	
Fluoric	per lb.	0	0	4¾

NOTICE.

Correspondents will please note that our Manchester address now is

Barton House,
66, Deansgate.

LATE ADVERTISEMENTS.

A RESPONSIBLE position required by gentleman aged 30. Up-to-date knowledge of business organisation, and thoroughly good experience of chemical trade. Excellent testimonials.—Box "1,539," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

ADVERTISER (39), two years with London Analyst, desires a salaried post in laboratory. Good testimonials and educational certificates.—"1,537," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

CRESYLIC ACID.—Offers Wanted for about 7,000 gallons refined Cresylic Acid, delivery into buyer's tank wagons at sellers' works in Lanarkshire, N.B.—For further particulars apply to Borland, King, Shaw and Co., 142, West George Street, Glasgow.

Notices.

All communications for the *Chemical Trade Journal* should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C.

Our Registered Telegraphic Addresses are:—

"Trepex, London."
"Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central.
Manchester: 3060.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*—payable in advance—including postage to any part of the world, are as follows:—

Yearly (52 numbers) ..... **12s. 6d.**
Half-Yearly (26 numbers) ..... **6s. 6d.**
Quarterly (13 numbers) ..... **3s. 6d.**

Back Numbers of the Journal.—In future all back numbers will be charged at 6d. per copy, plus postage.

CURRENT TOPICS.

THE SEPTEMBER TRADE RETURNS.

THE Board of Trade returns for September show only a small increase in total imports, but a considerable rise (over four and a half millions) in the value of total exports during the month. The total figures for the nine months of the year show increases of thirty-two millions and forty-one millions respectively, while a comparison with 1905 gives the remarkable figures of sixty-four and three-quarter millions increase in imports, and of nearly seventy-seven millions in exports during the nine months.

The figures for September are:—Total imports (value c.i.f.) £45,341,276., against £45,059,835., an increase of £281,441. Total exports of British and Irish produce (value f.o.b.), £35,156,320., against £30,525,153., an increase of £4,631,167. The comparison with 1905 shows a decrease of £385,453. in imports, and an increase of £5,805,860. in exports.

The imports of chemicals, drugs, dyes, and colours in September amounted to £875,990., against £709,591. in 1906, an increase of £166,399. The imports of bleaching materials were valued at £2,201., against £3,541., and of soda compounds £7,960., against £8,073. in 1906.

The exports of chemicals, drugs, dyes, and colours in September amounted to £1,227,425., against £1,186,968. in 1906, an increase of £40,457. During the month the principal items were:—Bleaching materials, 92,157 cwts., valued at £19,331., against 87,376 cwts. and £18,842. in 1906. Coal products (not dyes), value £79,305., against £95,458. in 1906. Copper sulphate, 763 tons, valued at £21,228., against 473 tons and £11,272. in 1906. Dyestuffs, £28,798., against £23,966. in 1906. Glycerine, £29,005., against £23,625. in 1906. Chemical manure, 70,414 tons, valued at £343,607., against 61,176 tons and £317,896. Muriate of ammonia, 10,075 cwts., valued at £13,523., against 10,948 cwts. and £14,478. in 1906. Painters' colours and materials, 151,677 cwts., valued at £193,998., against 159,120 cwts. and £197,353. in 1906. Soda compounds, 406,692 cwts., valued at £141,760., against 484,142 cwts. and £129,811. in 1906. The exports of salt in September amounted to 52,426 tons, valued at £41,631., against 48,188 tons and £37,411. in 1906. Exports of "unenumerated chemicals" were valued at £223,965., compared with £218,968. in 1906.

The imports of oil seeds, nuts, oils, fats, and gums in September amounted in value to £2,317,500., against £2,079,815. in 1906, an increase of £237,685. The figures for petroleum were 24,847,745 gallons, valued at £478,394., against 21,436,909 gallons and £442,100. in 1906. The value of exports of oil seeds, nuts, oils, fats, and gums was £295,895., against £253,622., an increase of £42,273.

The imports of metals and minerals during September were:—Copper ore, 7,253 tons, valued at £113,324., against

Digitized by Google

9,015 tons and £101,901. in 1906. Copper (regulus and precipitate), 6,395 tons, valued at £278,299., against 5,753 tons and £256,157. in 1906. Lead (pig and sheet), 13,678 tons, valued at £269,914., against 16,998 tons and £293,290. in 1906. Pyrites of iron and copper, 55,367 tons, valued at £92,462., against 54,531 tons and £88,943. in 1906. Quicksilver, 16,000 lbs., valued at £1,452., against 25,500 lbs., valued at £2,370. in 1906. Silver ore, value £120,718., against £248,837. in 1906. Tin, 3,429 tons, valued at £570,901., against 3,505 tons and £557,053. Zinc (crude), 6,633 tons, valued at £147,696., against 7,090 tons and £181,905.

LIMITED PARTNERSHIPS.

On another page of this issue will be found the full text of the Limited Partnerships Act, 1907, which comes into operation on January 1st of next year. The Act, which is regarded with considerable interest in commercial circles, provides that a limited partnership—in the case of bankers of not more than ten, and in any other case of not more than twenty—may be formed that shall consist of one or more persons who shall be liable for all debts and obligations of the firm, and one or more persons who shall contribute a sum of money as capital or property valued at a stated amount, and who shall only be liable for that amount. The first of these are to be known as general partners, and the second as limited partners. All limited partnerships must be registered as such, otherwise they will be considered as general partnerships.

A limited partner must not draw out or receive back any part of his contribution, or he will be liable for the debts of the firm up to the amount he draws out. No limited partner may take part in the management of the partnership business, though he may inspect the books of the firm and advise with the partners as to its state and prospects. Should he take part in the management of the business, he will be liable for all debts and obligations of the firm. Further provisions are that, in the event of death, lunacy, or bankruptcy, the partnership shall not be dissolved; also that applications to wind up shall be by petition under the Companies Act.

Registration of a limited partnership shall be effected by filing with the Registrar of Joint Stock Companies a statement, signed by the partners, and containing the following information:—(*a*) The firm's name; (*b*) the general nature of the business; (*c*) the principal place of business; (*d*) the full name of each of the partners; (*e*) the term, if any, for which the partnership is entered into, and the date of its commencement; (*f*) a statement that the partnership is limited and the description of every limited partner as such; (*g*) the sum contributed by each limited partner, and whether paid in cash or how otherwise. If during the continuance of a limited partnership any change, is made or occurs in any of these particulars a statement, signed by the firm, specifying the nature of the change must within seven days be sent to the Registrar, and a penalty not exceeding £1. per day is provided against each general partner in default. Provision is also made for the gazetting of any arrangement or transaction affecting the status of a general or limited partner of the firm or the assignment of the share of any limited partner, and for the payment of an *ad valorem* duty of 5s. per cent. on the amount of all capital contributed by a limited partner.

The Partnership Act of 1890 provides that the receipt by a person of a share of the profits of a business is *prima facie* evidence that he is a partner in the business, but the receipt of such share or of a payment contingent on or varying with the profits of a business does not of itself make him a partner in the business; and in particular . . (*d*) the advance of money by way of loan to a person engaged or about to engage in any business on a contract with that person that the lender shall receive a rate of interest varying with the profits or shall receive a share of the profits arising from carrying on the business does not of itself make the lender a partner with the person or persons carrying on the business or liable as such. Provided that the contract is in writing and signed by or on behalf of all parties thereto. The same Act provides that in the event of the person to whom any such loan is made becoming bankrupt or insolvent the lender shall be postponed for payment until the other creditors have been satisfied.

A legal correspondent of the *Manchester Guardian* observes that the only advantages of this new Act appear to be that a limited partner can inspect the books of the firm, examine into the state and prospects of the business, and advise with the partners therein. Should he do anything which a money lender, as a postponed creditor under the Partnership Act, could not do, he incurs the liability of a general partner in the one case just as much as in the other. It seems scarcely probable, therefore, that the new Act, with its elaborate registration arrangements, will be resorted to in preference to the provisions of the Partnership Act respecting loans by postponed creditors.

FALSE MARKS OF ORIGIN.

The question has been mooted recently as to whether there exist any legal remedies to put an end to the practice of falsely marking goods of foreign origin, and the British Chamber of Commerce in Paris is now moving energetically in the matter. On account of the manufacturer being abroad, the difficulty (in the case of French goods, for instance) of tracking the culprit is often very great. If the offender himself is a French manufacturer the task is much easier, and a recent decision demonstrates this very clearly.

A French "société anonyme," manufacturing wood rims for bicycle wheels, learnt recently that a firm, trading as E. G. and Co., were placing upon their rims a mark exactly resembling their own, but with this difference, that the names on the Company's marks were the names of real persons and places, while E. G. and Co.'s were purely fancy names coupled with imaginary companies. The French Company brought an action against E. G. and Co. on the grounds that the use of a purely imaginary American company's name was to suggest to the public that the goods came from the United States, and to induce them to purchase such goods in preference to those of French make. The Company's claims were rejected by the lower court on the ground that the practice of using fancy trade marks was a kind of commercial "snobbishness," and could not be regarded as an act of unlawful competition. The Company then appealed to the court of Grenoble, and this court reversed the decision by deciding that the Company had a *locus standi* for objecting to any acts on the part of a competing house by which it should attempt to induce the public into an erroneous belief as to its goods. Consequently the court forbade E. G. and Co. the use of the expressions "Wood Rim Co., Ltd.," and "American Continental Co.," but permitted them to retain the fancy words.

In the opinion of the British Chamber of Commerce in Paris the judgment is important, as it establishes the following points:—(1.) The indication of a false mark of

Digitized by Google

origin need not be express, but it may be by inference from the words or language used; (2) the use of fancy names of English appearance by themselves is not reprehensible; (3) the party complaining of this practice need not show actual damage; it is sufficient if he shows possible damage; (4) when possible damage is demonstrated the practice becomes unlawful *per se* and good faith is no defence.

It will be remembered that the following resolution was adopted at a meeting of the Associated Chambers of Commerce of the United Kingdom in March last:—"Whereas a practice has arisen amongst foreign manufacturers of marking their goods with English names or phrases of a nature to lead to the false supposition that they are British goods: It is resolved that representation be made to the Foreign Office to secure the effectual application to this practice of the provisions of the Convention of Madrid, of April 14th, 1891, on Industrial Property, and further, that the Foreign Office be requested to embody a clause in all official commercial treaties which may in the future be negotiated, with a view to securing the application of the said Convention." Various cases are mentioned in the current monthly circular of the British Chamber in Paris as demonstrating that nothing but the most active measures of repression will put an end to such practices.

NATURAL *v.* SYNTHETIC INDIGO.

[SPECIALLY CONTRIBUTED.]

IT was announced recently that a discovery had been made whereby the process of extracting natural indigo from the plant and preparing it for the market would be cheapened to such an extent that it would compete with synthetic indigo in price. The latter has never been able to oust it altogether from the market, in spite of the great difference in the relative cost. Dyers have always found customers who will pay as much as 6d. per yard on a piece of cloth for a colour which will not fade or modify its hue. But such consumers are limited, and the field of production has had to be limited in proportion.

It may be interesting in this connection to consider the history of indigo planting in Bengal. Dr. Shadwell has given us, in his "Industrial Efficiency" his conclusion that, where we have fallen behind our competitors in any industry, the cause is almost always to be found in the lack of energy and vigilance following on great prosperity. It would be hard to find a better instance of this than in the production of indigo.

In the days preceding the advent of synthetic indigo the planter was a rich man: a fortune was easily made, and while he was making it he lived like a Nawab. He built palatial mansions on his estates, kept his hounds, and brought into the business his sons and his friends' sons who had no other obvious profession or source of income—very often those who would not have found it easy to succeed elsewhere; admirable sportsmen, perfect gentlemen, but possessed of no particular ability or wish to excel in this industry.

Again, the sale of their output was entrusted to good old steady-going firms of general merchants, who did not handle the goods for nothing. They were accustomed to handling consignments, import and export, with little or no risk, and for very comfortable commissions; their duties as agents did not weigh upon them; they considered this and similar sources of income as permanent, and their junior staff discussed generalities in well-turned sentences in the homeward mail. Then came difficulties in selling the indigo; but the merchants were sanguine, and having known little or nothing of the industry before, did not think it worth while to look into the matter seriously now. They responded to calls for ready money, and perhaps chuckled as they stowed away mortgage deeds in their safes. And so before they knew it the business was ruined, the market flooded with cheap synthetic indigo, the planter shutting up homes in England and bringing his women folk out to India, while the merchant wondered whether he could recover even 5s. in the pound of his advances.

From whole districts such as Midnapore the industry disappeared altogether, and the colony of old planter families in Behar is almost the only relic of that all too easy source of revenue. An air of good breeding and boundless hospitality are distinguishing marks of the Behar indigo-planting community. They have had to pay dearly for their period of reckless prosperity, and so have the good easy-going merchants who, owing to the peculiar laws and customs of the district, could not evict their bankrupt debtors; nor, indeed, if they had succeeded in this could they have carried on the concerns themselves. They have in most cases thought best to cut their losses and sell their part or whole interest for an old song, the buyers in most cases being the former planters who—the capital being so to speak written down—are now able to pay their way. Latterly they have been doing what they should have done years ago—sharpening their wits, becoming businesslike, studying their own industry and its possibilities, experimenting in alternative crops, turning to chemistry, and looking for by-products to increase their profits. Native doctors consider indigo a reliable remedy for cholera: chance flooding of growing indigo has revealed the fact that the plant has valuable properties as a manure for other crops. Prosperity has not yet been regained in Behar, but there are possibilities and prospects for indigo and for other industries, such as sugar planting and refining, to the profitable working of which the path is being slowly pioneered.

Lastly, the merchants have learnt that as agents for indigo concerns, tea gardens, or similar undertakings, it does not pay in the long run to make money too easily; that it is better to study the industry at one end and the markets at the other, to keep in close touch with their planters, and to send representatives frequently to the estates up country. If the preparation of indigo is cheapened and the industry is given thereby a new lease of life, we may feel sure that those concerned in its production will not be in a hurry to imitate the methods of their predecessors.

THE LIMITED PARTNERSHIPS ACT, 1907.

THE following is the text of the "Act to Establish Limited Partnerships," to which reference is made in our editorial columns:—

(1.) This Act may be cited for all purposes as the Limited Partnerships Act, 1907.

(2.) This Act shall come into operation on the first day of January one thousand nine hundred and eight.

(3.) In the construction of this Act the following words and expressions shall have the meanings respectively assigned to them in this section, unless there be something in the subject or context repugnant to such construction:—

"Firm," "firm name," and "business" have the same meanings as in the Partnership Act, 1890:

"General partner" shall mean any partner who is not a limited partner as defined by this Act.

(4.)—(1) From and after the commencement of this Act limited partnerships may be formed in the manner and subject to the conditions by this Act provided.

(2) A limited partnership shall not consist, in the case of a partnership carrying on the business of banking, of more than ten persons, and, in the case of any other partnership, of more than twenty persons, and must consist of one or more persons called general partners, who shall be liable for all debts and obligations of the firm, and one or more persons to be called limited partners, who shall at the time of entering into such partnership contribute thereto a sum or sums as capital or property valued at a stated amount, and who shall not be liable for the debts or obligations of the firm beyond the amount so contributed.

(3) A limited partner shall not during the continuance of the partnership, either directly or indirectly, draw out or receive back any part of his contribution, and if he does so draw out or receive back any such part shall be liable for the debts and obligations of the firm up to the amount so drawn out or received back.

(4) A body corporate may be a limited partner.

(5.) Every limited partnership must be registered as such in accordance with the provisions of this Act, or in default thereof it shall be deemed to be a general partnership, and every limited partner shall be deemed to be a general partner.

(6.)—(1) A limited partner shall not take part in the management of the partnership business, and shall not have power to bind the firm:

Digitized by Google

Provided that a limited partner may by himself, or his agent, at any time inspect the books of the firm and examine into the state and prospects of the partnership business, and may advise with the partners thereon.

If a limited partner takes part in the management of the partnership business he shall be liable for all debts and obligations of the firm incurred while he so takes part in the management, as though he were a general partner.

(2) A limited partnership shall not be dissolved by the death or bankruptcy of a limited partner, and the lunacy of a limited partner shall not be a ground for dissolution of the partnership by the court unless the lunatic's share cannot be otherwise ascertained and realised.

(3) In the event of the dissolution of a limited partnership its affairs shall be wound up by the general partners, unless the court otherwise orders.

(4) Applications to the court to wind up a limited partnership shall be by petition under the Companies Acts, 1862 to 1900, and the provisions of those Acts relating to the winding-up of companies by the court and of the rules made thereunder (including provisions as to fees) shall, subject to such modifications (if any) as the Lord Chancellor, with the concurrence of the President of the Board of Trade, may by rules provide, apply to the winding-up by the court of limited partnerships, with the substitution of general partners for directors.

(5) Subject to any agreement expressed or implied between the partners—

(*a*) Any difference arising as to ordinary matters connected with the partnership business may be decided by a majority of the general partners;

(*b*) A limited partner may, with the consent of the general partners, assign his share in the partnership, and upon such an assignment the assignee shall become a limited partner with all the rights of the assignor;

(*c*) The other partners shall not be entitled to dissolve the partnership by reason of any limited partner suffering his share to be charged for his separate debt;

(*d*) A person may be introduced as a partner without the consent of the existing limited partners;

(*e*) A limited partner shall not be entitled to dissolve the partnership by notice.

(7.) Subject to the provisions of this Act, the Partnership Act, 1890, and the rules of equity and of common law applicable to partnerships, except so far as they are inconsistent with the express provisions of the last-mentioned Act, shall apply to limited partnerships.

(8.) The registration of a limited partnership shall be effected by sending by post or delivering to the registrar at the register office in that part of the United Kingdom in which the principal place of business of the limited partnership is situated or proposed to be situated, a statement signed by the partners containing the following particulars:—

(*a*) The firm name;
(*b*) The general nature of the business;
(*c*) The principal place of business;
(*d*) The full name of each of the partners;
(*e*) The term, if any, for which the partnership is entered into, and the date of its commencement;
(*f*) A statement that the partnership is limited, and the description of every limited partner as such;
(*g*) The sum contributed by each limited partner, and whether paid in cash or how otherwise.

(9.)—(1) If during the continuance of a limited partnership any change is made or occurs in—

(*a*) the firm name,
(*b*) the general nature of the business,
(*c*) the principal place of business,
(*d*) the partners or the name of any partner,
(*e*) the term or character of the partnership,
(*f*) the sum contributed by any limited partner,
(*g*) the liability of any partner by reason of his becoming a limited instead of a general partner or a general instead of a limited partner,

a statement, signed by the firm, specifying the nature of the change shall, within seven days, be sent by post or delivered to the registrar at the register office in that part of the United Kingdom in which the partnership is registered.

(2) If default is made in compliance with the requirements of this section each of the general partners shall, on conviction under the Summary Jurisdiction Acts, be liable to a fine not exceeding one pound for each day during which the default continues.

(10.)—(1) Notice of any arrangement or transaction under which any person will cease to be a general partner in any firm, and will become a limited partner in that firm, or under which the share of a limited partner in a firm will be assigned to any person, shall be forthwith advertised in the Gazette, and until notice of the arrangement or transaction is so advertised, the arrangement or transaction shall, for the purposes of this Act, be deemed to be of no effect.

(2) For the purposes of this section, the expression "the Gazette" means—

In the case of a limited partnership registered in England, the London Gazette;
In the case of a limited partnership registered in Scotland, the Edinburgh Gazette;
In the case of a limited partnership registered in Ireland, the Dublin Gazette.

(11.) The statement of the amount contributed by a limited partner, and a statement of any increase in that amount, sent to the registrar for registration under this Act, shall be charged with an *ad valorem* stamp duty of five shillings for every one hundred pounds, and any fraction of one hundred pounds over any multiple of one hundred pounds, of the amount so contributed, or of the increase of that amount, as the case may be; and in default of payment of stamp duty thereon, as herein required, the duty with interest thereon at the rate of five per cent. per annum from the date of delivery of such statement shall be a joint and several debt to His Majesty, recoverable from the partners, or any of them, in the said statements named, or, in the case of an increase, from all or any of the said partners whose discontinuance in the firm shall not, before the date of delivery of such statement of increase, have been duly notified to the registrar.

(12.) Every one commits a misdemeanor, and shall be liable to imprisonment with hard labour for a term not exceeding two years, who makes, signs, sends, or delivers for the purpose of registration under this Act any false statement known by him to be false.

(13.) On receiving any statement made in pursuance of this Act the registrar shall cause the same to be filed, and he shall send by post to the firm from whom such statement shall have been received a certificate of the registration thereof.

(14.) At each of the register offices hereinafter referred to the registrar shall keep, in proper books to be provided for the purpose, a register and an index of all the limited partnerships registered as aforesaid, and of all the statements registered in relation to such partnerships.

(15.) The registrar of joint stock companies shall be the registrar of limited partnerships, and the several offices for the registration of joint stock companies in London, Edinburgh, and Dublin, shall be the offices for the registration of limited partnerships carrying on business within those parts of the United Kingdom in which they are respectively situated.

(16.)—(1) Any person may inspect the statements filed by the registrar in the register offices aforesaid, and there shall be paid for such inspection such fees as may be appointed by the Board of Trade, not exceeding one shilling for each inspection; and any person may require a certificate of the registration of any limited partnership, or a copy of or extract from any registered statement, to be certified by the registrar, and there shall be paid for such certificate of registration, certified copy, or extract such fees as the Board of Trade may appoint, not exceeding two shillings for the certificate of registration, and not exceeding sixpence for each folio of seventy-two words, or in Scotland for each sheet of two hundred words.

(2) A certificate of registration, or a copy of or extract from any statement registered under this Act, if duly certified to be a true copy under the hand of the registrar or one of the assistant registrars (whom it shall not be necessary to prove to be the registrar or assistant registrar) shall, in all legal proceedings, civil or criminal, and in all cases whatsoever be received in evidence.

(17.) The Board of Trade may make rules (but as to fees with the concurrence of the Treasury) concerning any of the following matters—

(*a*) The fees to be paid to the registrar under this Act, so that they do not exceed in the case of the original registration of a limited partnership the sum of two pounds, and in any other case the sum of five shillings;
(*b*) The duties or additional duties to be performed by the registrar for the purposes of this Act;
(*c*) The performance by assistant registrars and other officers of acts by this Act required to be done by the registrar;
(*d*) The forms to be used for the purposes of this Act;
(*e*) Generally the conduct and regulation of registration under this Act and any matters incidental thereto.

THE LABOUR MARKET IN SEPTEMBER.

THE Memorandum prepared by the Labour Department of the Board of Trade for the *Board of Trade Labour Gazette*, on the state of the labour market in September states that during the month employment was, on the whole, worse than in August. The shipbuilding and engineering trades continued to decline, and there was also some falling off in the building trades and in the furnishing trades. The coal mining and tin plate industries remained very brisk. As compared with a year ago, there was some improvement in coal mining and in all the textile industries, and a decline in the engineering, shipbuilding, printing and bookbinding trades. In the 273 trade unions, with a total membership of 631,241, making returns, 28,914 (or 4.6 per cent.) were reported as unemployed at the end of September, 1907, compared with 4.0 per cent. at the end of August, 1907, and 3.8 per cent. at the end of September, 1906.

Twenty-nine new disputes began in September, as compared with 27 in the previous month, and 23 in September, 1906. The total number of workpeople affected by disputes which began or were in progress during September, 1907, was 10,833, or 3,079 less than in August, 1907, and 10,544 less than in September, 1906. The aggregate duration of all the disputes of the month, new and old, amounted to 72,100 working days, or 113,300 less than in August, 1907, and 75,300 less than in September, 1906. Definite results were reported in the case of 24 disputes, new and old, directly affecting 3,160 persons. Of these 24 disputes, 10 were decided in favour of the workpeople, 7 in favour of the employers, and 7 were compromised.

The changes reported in September affected 29,000 workpeople, all of whom received advances. Included in this total were 12,000 coal miners in the Forest of Dean, Radstock, and Bristol districts, 4,000 shale miners in Scotland, and 5,000 iron and steel workers in South Wales, and 3,000 in Scotland. The total computed effect of all the changes reported was an advance of about £2,500. per week.

Obituary.—The death took place, on the 4th inst., of *Mr. D. Dawson*, the founder of the firm of D. Dawson and Sons, chemical manufacturers, Milnsbridge, Huddersfield. Mr. Dawson was in his 71st year.

WEST MOUNT LYELL LTD.—Capital £100,000., in £1. shares. This company has been formed to take over all or any of the assets of any other company, and to carry on the business of gold, silver, copper, lead, tin, quicksilver, iron, stone, coal and general miners. No initial public issue. The first directors are R. E. Tyler, of Spring Grove, Osterley Park, and J. E. Franck, 11, Pancras Lane, E.C. Qualification, one share. Remuneration, £100. each per annum (£50. extra for the chairman). Registered office, 212-13, Mansion House Chambers, E.C.

THE DEODORISATION OF FISH OILS.

By Josef Hankam (communicated by H. Wiskemann).

In the fat and oil industries there is perhaps no section which has been so stimulating to research as the deodorisation of fish oils and fats. The reason for this activity is no doubt fairly evident to those interested in the industry. The very large quantities of fish oils available year by year from Norway, Newfoundland, Japan, Canada, etc., provide an excellent raw material for the manufacture of soap, and the lower prices of the suitable oils, as compared with other raw materials, afford sufficient incentive for the manufacturer to use them as far as possible. The higher prices of linseed oil and oleine restrict him to whale oil for the production of soaps which will stand the cold. The use of whale oil is of course limited in the case of those manufacturers who are unable to deodorise it.

In this article I refer only to the use of fish oils and fats as far as the manufacture of soap and stearine is concerned, and in these industries the oils and fats must be particularly free from smell. For the manufacture of "degras" and leather the deodorisation of the oils is not a matter of first importance.

Of the four qualities obtainable in the market, hitherto only Nos. 0, 1, and 2 could be used in the manufacture of soap; No. 3 quality was quite unsuited for this purpose, owing to its penetrating and fishy smell. The fish-oil stearine obtained from the clearing vats in the large cod liver oil factories is also an excellent raw material for the manufacture of soap and stearine, although it possesses the characteristic fishy smell.

For some years I have been occupied with the working up and utilisation of fish fats or fish grease; the object being the production of fatty acids which in turn would serve for the manufacture of stearine. These fish fats have a remarkably high titre, a fact that is intimately connected with a considerable yield of stearine (about 50%). The water-white kinds of fish-oil stearine are likewise very suitable for the production of "smooth" oleine or silver soap; the darker and brown descriptions are not immediately suitable because of the pronounced fishy odour. Some of the fish-fats worked up in the course of the experiments had titres of 38.2° C., 38.9° C., 40.8° C., and 41.2°C. They correspond, therefore, as regards the point of solidification of the fatty acids, to a good bone fat. The amount of free fatty acids fluctuates in the case of these fats, ranging in the material dealt with from 13.24% to 33.63%. For laboratory purposes only there had come under my notice fish-fats with as much as 63.57% of free fatty acids.

While on the one hand fish oils and fats varying greatly in character would apparently form a good raw material, on the other hand the drawback of smell, although in many cases being absent so far as the resultant soap is concerned, nevertheless manifests its presence in the linen washed with such soap. Even in the waste fats from industries in which fish oils have been used ("degras" for instance), and in which besides other kinds of fats—such as tallow, wool fat, and vaseline oils,—only a certain percentage of fish-oil is added, the characteristic smell can immediately be detected, notwithstanding the various operations entailed by the regeneration of the fats. This consideration prevents the sale of such waste fats, whether purified or not. Even by distilling the split fish-oil fatty acids it is not possible to eradicate the odour; although this is temporarily decreased, it reappears after a time.

As the result of my experiments on this subject, which have extended over a number of years and have been made on a fairly large scale, I find that unless the smell is eliminated the ready sale of such fish oils or their fatty acids for the manufacture of soaps and stearine is out of the question. Although the stearine obtained has but a slight odour, and, when mixed with tallow, bone fat, palm oil, vegetable tallow, etc., it can generally be used directly for making candles, there are traces of the smell to be found subsequently in the oleine. For this reason the sale of the latter is extremely difficult, apart from the fact that it contains a somewhat larger proportion of non-saponifiable constituents.*

The difficulty in deodorising the fish-oils and fish-fats is due to the presence of various nitrogenous compounds, which in the process of obtaining the fish-oils become incorporated with them,† and these nitrogenous compounds, unless completely eliminated, give rise to repeated decomposition. Hence it is only possible to successfully deodorise any fish-oil and fish-fat if from the outset the fullest attention is given to the way in which these oils are obtained. It is essential that at the place of extraction the fish-oils should be sufficiently purified to prevent sundry glue-like and albuminous substances from being dissolved by the oils, otherwise these will give rise to the objectionable smell.‡ It is not sufficient for the durability of fish-oils to simply purify them by allowing the gluey and slimy substances to settle down.

In the course of time a number of methods for the elimination of the smell have been elaborated, but many of them have shown but indifferent results. The methods which act by causing the smell to disappear temporarily by the use of various perfumes, such as oil of mirbane, ginger-grass oil, cumarin, menthol, etc., cannot seriously come into question here.§ Although for a time the smell may be disguised, it reappears in its original intensity when the fats are used, for example, in the manufacture of soap and stearine, where they are exposed direct to the action of steam, as the volatile perfumes which have been added are then carried off with the steam. Frequently—and more especially so if the much favoured oil of mirbane is employed—the result is that the presence of this scent gives rise to doubts regarding the product. Hence the use of scents is only a make-shift, which does not overcome the drawback, which is apt to recur upon the slightest external provocation.

(*To be continued.*)

* The amount of non-saponifiable constituents of such fish-oil oleins has been determined by me in several cases, and has invariably been found to exceed 1 per cent. In crude fish oils from various sources the amount of non saponifiable constituents was found to be 1 37, 1 55, and 1.57 per cent. In one instance, where the fish fat had an exceedingly penetrating smell, and had been rendered impure by various glue-like substances, I found 2.21 per cent. of non-saponifiable constituents.

† See *Chemiker Zeitung* of 1900. There form in fish oils offensive-smelling bases, such as cadaverin ($C_5H_{16}N_2$) gadinin ($C_7H_{17}NO_2$), putresein $C_4N_{12}N_2$). According to Gregor Sandberg it is a question of the products of decomposition of albuminous substances, such as amines NH_2 (CH_3), NH (CH_3)$_2$, N (CH_3)$_3$.

‡ See also Dr. Lewkowitsch's noteworthy suggestions, *Seifensieder Zeitung*, Augsberg, 1903, No. 32.

Continental Notes.

In the *Chemiker Zeitung* for October 2, K. Dieterich writes on the analysis of beeswax in various stages of its production. According as the wax is newly formed or has served for the storage of honey for several years it differs very considerably in outward appearance and also in the proportion of matter insoluble in chloroform. It becomes darker in colour as it gets older, and becomes more insoluble. The melting-point and specific gravity also fall in the course of time, as is shown by the figures which the author has obtained with some genuine samples. Commercial samples of beeswax, however, always consist of mixtures of waxes of various ages. They also, almost invariably, contain some foreign wax, which; however, has not been added as an adulterant, but is the material of which the artificial cells were made; of these latter there are generally a few rows in every new frame that is used. The object of these artificial cells is of course to render the building of the comb more easy for the bees. The author also deals with "bees' resin" or "propolis," which is used by the bees to fasten the frames and the commencement of the combs, and to cover over material that is beginning to decompose. This "propolis" is not easy to obtain, as it is generally put in together with the wax, and the quantity available was not sufficient to enable the author to make a full examination.

In the *Zeitschrift für das gesamte Schiess-mund Sprengstoffwesen* for August 15, Dr. H. Rohne gives a brief account of the early attempts of Captain Schultze to improve gunpowder. Being a practical manufacturer, he approached the problem from the point of view of the maker rather than of the user; his object was to diminish the danger of manufacture, and also to cheapen it by reducing the proportion of nitre. The process he worked out consisted of purifying wood by boiling, etc., then forming it into little cylinders, and impregnating it with saltpetre or barium nitrate. The product was, however, too violent to use in rifled firearms, although it found some favour as a sporting powder. Later on the strength was increased by nitrating the wood, and its violence was kept within moderate bounds by the addition of paraffin wax and other materials.

The same issue contains instalments of a paper on the calorimetric examination of explosives, and the action of explosions

Digitized by Google

at a distance, the latter being a translation of the account given in the "Mémorial des Poudres et Saltpêtres," of the experiments carried out under the direction of the French authorities.

In the issue of September 15, Dr. F. Erban writes on arrangements for dealing with fires in factories, and points out the importance of having up-to-date appliances for the extinguishing of conflagrations. The fire brigade should be under the direct command of the manager or one of the principal officials of the factory, so that there may be no danger of dispute as to orders. It is specially important in chemical works that the fire should be attacked in its early stages, for if it once obtains hold the damage done may be enormous, as was only too clearly shown in the case of the fire in the picric acid factory at Griesheim-Elektron, and more recently at the roburite factory at Witten. The arrangements to be made must of course depend upon the local conditions, and in each separate case it is necessary to decide whether hydrants, sprinklers, or fire engines are the best appliances to provide, but in all cases it should be remembered that undue economy is not cheap in the long run. In the enormous chemical works at Höchst there is a very well organised brigade, provided with all the most modern appliances. In order that valuable time may not be wasted in getting up steam in fire engines, portable steam pumps are provided, which can be very rapidly connected with the boiler of a locomotive which is kept under steam day and night. This pump draws water from one of the numerous hydrants that are scattered about the works, and as there are lines of rails throughout, it can throw three or four powerful jets to any spot.

To the British commercial man it would almost appear impossible to carry on extensive financial and commercial business without a system of bankers' cheques such as we have in this country. Nevertheless, this great convenience is absent in Germany, and it is only now proposed to bring in a law that shall encourage this method of making payments. One consequence of the absence of this system in Germany is that a very large proportion of the payments have to be made in cash, and the demand for money is therefore great, while the bank rate is proportionately high. In *Chemische Industrie* for September, Dr. E. Kloeppel gives some particulars of the proposed law. It appears that the Germans are still afraid to make payment by cheque as simple and easy as it is in this country. They consider, for instance, that there should be a provision that the cheque should be presented for payment within seven days of the date when it was drawn, and that the drawer should not have the power to stop payment until this period has expired.

Reports of Companies.

SALINAS OF MEXICO, LTD.

In May, 1906, this company took over from a local firm salt-producing properties which had practically a monopoly of the local supply. The new works at Salinas and Palomas have made considerable progress, though the new installations did not come into use in time to effect the results of the financial year. The quality and quantity of the salt produced compare favourably with those obtained by previous owners.

The gross profit of the twelve months was £21,085., the net profit of which is £18,750., and the directors recommend that £1,000. should be transferred to the plant renewals and depreciation account, and a balance of £4,491. carried forward. Of the nominal capital of £325,000., £280,007. has been issued in fully paid shares and 1,250 shares of £1. are 1s. paid. All the £300,000. 5% participating debentures are issued and paid-up. The property item stands at £527,867., and includes some valuation for intangible assets; the remaining assets are—stocks, £32,500., debtors £6,388., and cash £21,855. The company is making trial borings in order to find deposits of heavier brine, which, if found, will enable the company to increase its output of salt and reduce the cost of production.

WILLANS AND ROBINSON, LTD.

At the meeting of shareholders, held last week, Mr. M. Robinson, who presided, said that the marked improvement in the results was primarily due to the late reduction of capital, which had not only enabled them to distribute the profits made, but by removing for the present the necessity for further writing down the reduced valuation of the Queensferry property had added substantially to their profit. The new business at Rugby was doing well, the profit for the two half years ending June 30 exceeding £41,000. The price of all materials used in the engineering trade was very high. Competition was greatly increasing, and continued to cut down prices and profits, with growing harm to the trade and little gain to anyone. They had avoided the reckless tendering which was, unfortunately, so common, but had carried off by far the greater part of the publicly advertised contracts for steam turbines, though their prices were rarely the lowest. They proposed to pay a 10% dividend, which was a promising beginning after the reorganisation of the capital.

THE TRADE OF LOURENCO MARQUES.

In his report on the trade of Lourenço Marques for the year 1906, Consul-General Major Baldwin states that the imports for local consumption show a decrease in value of £80,418., equal to 7.7%, as compared with the year 1905, and of 14.4% as compared with the average for the three years 1903-05.

The importation of cement has increased since the year 1905 from 5,352 to 7,988 tons, but while the United Kingdom's share has decreased from 19 to 14%, Germany's has increased from 58 to 64%.

There are possibilities in the cultivation of rubber-producing plants, but it yet remains to be seen what particular species are most suitable for the soil and climate. Varieties of Landolphia occur in the districts of Gaza and Inhambane where they are indigenous, but the native method of collection is destructive to the vine, and as yet no systematic effort has been made to regulate it. A plantation of Ceara rubber exists at Inhambane, and experiments with the same tree have been carried out in the Lourenço Marques district, but their success has not been striking. The comparatively long time which must elapse between the planting and a profitable yield tends to discourage the investment of capital in the industry.

Ceara rubber has been planted on a large scale in the open ground near Inhambane, where it is subjected to the force of the prevailing south winds. This species is a forest tree and requires shelter, notwithstanding which, trees six years old from this plantation have yielded from ¾ to 1 lb. of excellent rubber. Landolphia are the great rubber-yielding vines. Practically there are only three kinds in this district; these grow in thick forest shade rambling from tree to tree and often found over 400 feet in length. The latex from these vines coagulates quickly by the atmospheric action, so that no artificial aid is required to harden the substance. The annexed table gives a comparison of the quantities exported:—

Year.	Quantity. Tons	Value. £
1903	37.87 ..	6,508
1904	42.41 ..	13,052
1905	14.70 ..	4,905

The prevalent local price is 8s. to 9s. per 2.34 lbs.; second quality, 4s. to 5s. per 2.34 lbs. There are enormous possibilities, as the amount available has only been exploited to a small extent.

Inquiries show that trees from which mangrove bark is obtainable grow in great profusion within a 10-mile radius of this port along the banks of the small rivers connecting with the bay on which the town stands.

The principal imports to Lourenço Marques have been as follows:—

	Quantity. 1903.	1904.	1905	1906	Value. 1906.
Candles.....lbs.	124,000 ..	102,000 ..	76,000 ..	92,646 ..	£1 951
Cement.....tons	7 691 ..	9 127 ..	5,352 ..	7,988 ..	20,272
Chemicals and apothecaries' wares.....lbs.	610,000 ..	214,000 ...	198,000 ..	350.419 ..	11 364
Gunpowder.....lbs.	— ..	7,510 ..	156 ..	9,272 ..	383
Indiarubber goods lbs.	— ..	— ..	— ..	13 770 ..	980

AN AUTOMATIC CHAIN-MAKING MACHINE.

THE necessity for cheap mechanical transport of bulk goods between the various points in a large manufacturing establishment has resulted in the evolution of a highly efficient system of automatic conveyers; and the general adoption of these machines has in turn called for great improvements in the manufacture of the conveyer belts required for this purpose. Mr. Gilbert Little is well known in connection with the development of automatic conveying plant, and the illustration below (Fig. 1) shows an ingenious machine which is now in operation

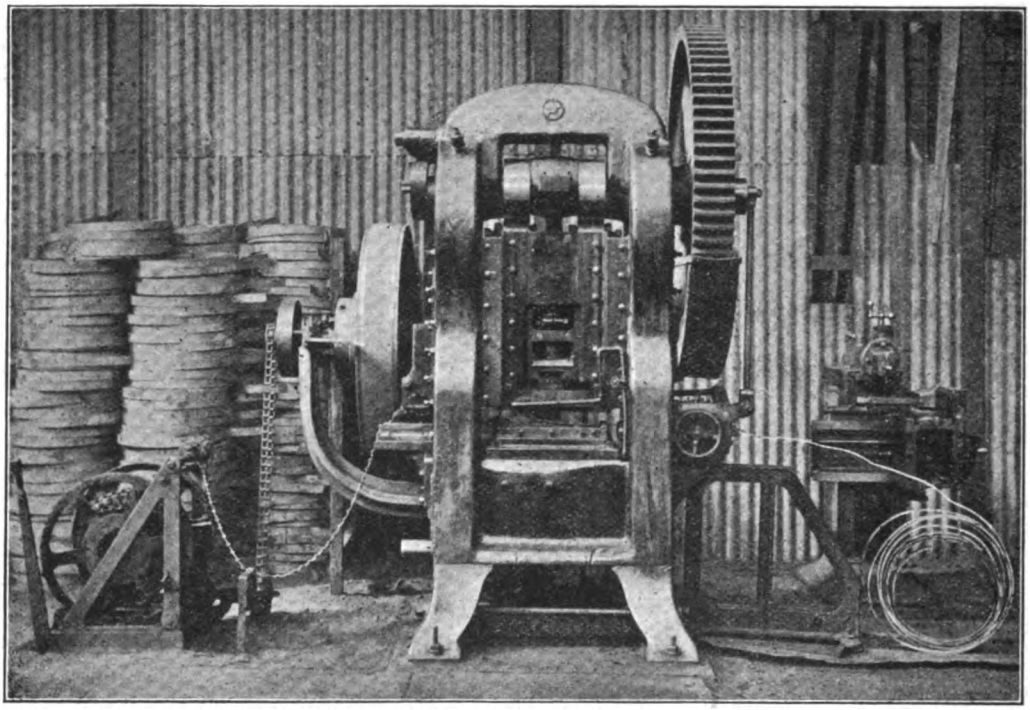

FIG. 1.

at the works of the Gilbert Little Co., Ltd., of Bradford, for the manufacture of the Locke tempered steel link-belt.

The machine works quite automatically. A steel bar is drawn in at one end, and is delivered as a finished assembled chain, various sizes of which are now being extensively adopted in many industries for conveyers, elevators, and chain-drives generally. A chain transmits power through sprocket-wheels

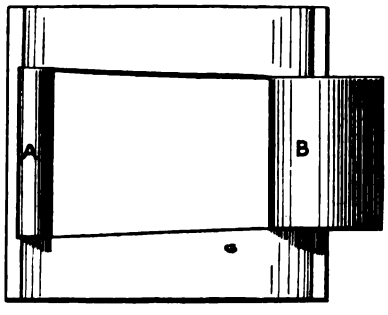

FIG. 2.

to conveyers and chain-drives as positive as two gear wheels; no form of textile or leather belting can be relied upon to do this. The Gilbert Little Company, who last year bought extensive new works, adjoining Great Horton Station, Bradford, have arranged for the exclusive handling of the machine-made Locke patent belt. The chief defects common to most malleable cast links are unevenness in pitch and the stretching of the metal when at work. Mr. Duncan Sinclair, a director of the Gilbert Little Company, has made a special study of tempered steel, and after costly experimenting he has overcame these defects. Mr. Sinclair discovered that steel of a specially resilient character, hardened and tempered in a certain way, was essential to satisfactory results in working. The steel now used in the links springs and recovers if the chain, while in use, is subject to sudden shocks or intermittent jerks. Since the Company took up the handling of the machine-made link-belt, the various sizes have been put to work under the most severe conditions, and have proved satisfactory where other forms of chain-belts had failed.

It will be seen from our illustration that the links are easily detached from, or attached to, one another. All that has to be done is to turn up any particular link, as shown in our illustrations, and it will slip over the end of the annexed link. A feature of each link, of any size, is that the bearing or wearing surface is double that of any other form of chain-belt. Experience has proved that the tempered steel belt is as efficient in use as it is simple in construction. The outstanding advantages appear to be that it possesses, size for size, double the working strain of the corresponding numbers of malleable castchains, although only one-half the weight; therefore smaller and cheaper sizes can be used for the same duty, while the wearing properties of the tempered steel chain, with the larger bearing surfaces, are such that it lasts twice as long as malleable cast chains.

The links themselves are made very simply. The automatic machines draw in strips or bars of steel and cut the desired lengths. Each separate piece then has three cuts made in it

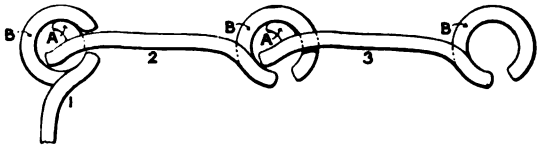

FIG. 3.

through the steel, these cuts forming a figure very much like the letter H, but slightly tapered, and with the cross-cut nearer one end than the other. The two tongues A and B are then bent to the forms shown at A and B in Figs. 2 and 3, A being, of course, shorter and wider than B. The links so formed easily fit into one another. On the left hand of Fig. 3 is shown the manner in which this fitting together is effected. When in the position indicated, the link 1 can readily be slid over the end of link 2, and having been slid far enough, it is turned

Digitized by Google

through a right angle. The tongue B, being narrower than A, readily enters the place left vacant in link 2 by the latter when it is bent up to form the link, and the links 1 and 2 will take up relatively the same positions as are occupied by links 2 and 3, in Fig. 3. The machine turns out all sizes of chain at the rate of 200 feet per hour.

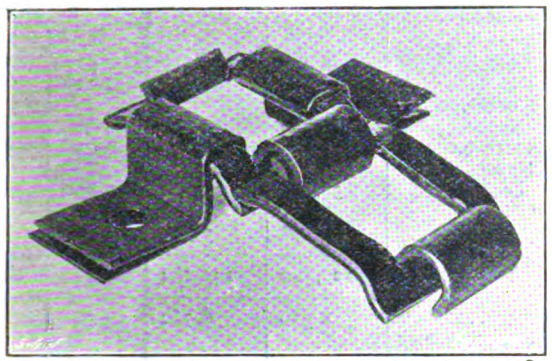

FIG. 4.

Fig. 4 shows two completed links, one of which has an attachment for carrying an elevator bucket. Fig. 5 shows a variety of the designs of attachments manufactured, but numerous other styles are made to meet all requirements, and the attachments, besides being detachable and renewable, are made of steel. This makes them over four times stronger than attachments cast on other forms of link-belts.

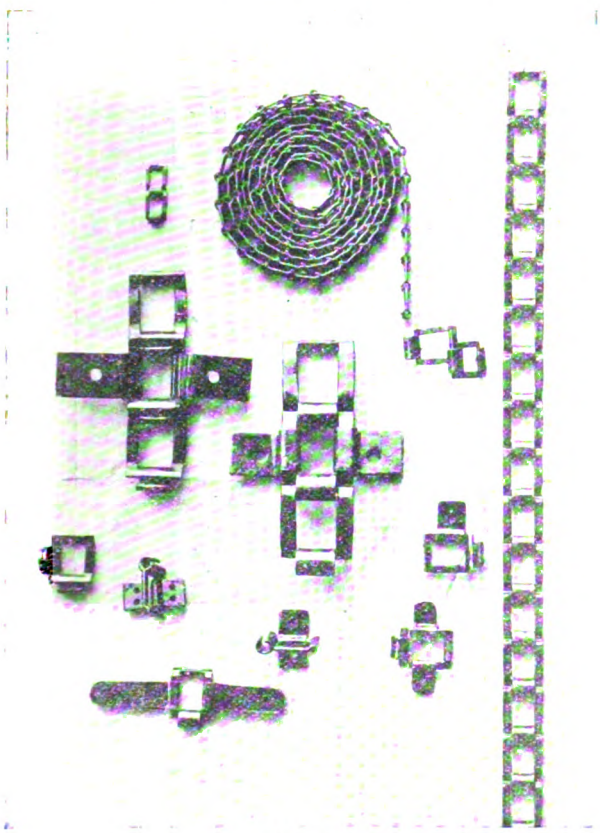

FIG. 5.

Numerous tests have been made of all sizes of the belts, with the result that, size for size, they are only half the weight of the corresponding numbers of malleable cast links, but possess double the working strain. The standard sizes work on "Ewart's," "Ley's," or "Bagshawe's" wheels, but all sizes of sprocket-wheels are made by the Gilbert Little Company.

LONDON QUARTERLY INDIGO SALES.

MESSRS. MILLWARD AND CO. report as follows, under date October 14th.

The last quarterly sale of the year took place to-day, when out of 650 chests declared, 580 chests were brought forward, 70 chests having been withdrawn and not printed. The indigo offered may be classified in comparison with the corresponding sales last year as follows:—

	1907.		1906.
Bengal	222 chests.	..	375 chests.
Kurpah	260 ,,	..	65 ,,
Madras	89 ,,	..	77 ,,
Musters, Figs, &c..	9 ,,	..	3 ,,
Total ..	580 chests.	..	520 chests.

Good and fine Bengal afforded a fair selection, but ordinary and common grades were scarce. Kurpah was in good supply, especially in the finer qualities, but most of the dry-leaf Madras offered was low and common with a few good lots.

During the past three months the market has been quiet, with a small but steady trade at firm prices. The absence of medium qualities testing about 60% has restricted business, but consumers are realising more generally that excellent dyeing results may be obtained by using the fine Bengal and ordinary Kurpah together. Very small stocks are held either by dealers or users, and trade, pending freer supplies, will continue from hand to mouth.

Unfortunately, the worst fears concerning the new crop have been realised, and instead of a larger out-turn it is now doubtful whether last season's small yield will be even equalled—indeed, the most reliable estimates put 25,000 to 26,000 maunds as the maximum. This continuous blighting of prospects for a number of seasons in unbroken succession must be very disheartening to planters, but they have encouragement to proceed in the excellent yield of the Java-Natal seed plant, and the knowledge that these bad weather seasons are abnormal, and may be followed by a sequence of favourable years. In the meantime, users must recognise the fact that they will have to wait a little longer for the anticipated larger supplies and cheaper prices.

Deliveries, January 1st to October 11th.		Stocks in London, October 11th.	
1907.	1906.	1907.	1906.
2,350 Chests.	2,732 Chests. ..	2,486 Chests.	2,247 Chests.
530 Serons.	624 Serons. ..	188 Serons.	460 Serons.

The sales were fairly well attended, and any lots moderately priced met with a ready sale at firm prices, excepting for a few odd lots of Kurpah, which were knocked down rather cheaply. Most of the lots withdrawn are limited above the currency.

Quotations for Bengal are fully par to slightly dearer; Kurpah, par to slightly easier; Madras and Figs, no sales reported. Of the 650 chests declared, 200 were sold.

Present currency is:—Bengal, 2s. 6d. to 4s. 6d. per lb.; Kurpah, 1s. 4d. to 2s. 9d.; Madras, 1s. 3d. to 2s. 3d.; Figs, 1s. 4d. to 1s. 6d.; Guatemala, 2s. 6d. to 3s.; Java, 3s. 3d. to 5s.

ELECTROLYTIC ALKALI CO., LTD.—Registration has been made of the issue, on September 23, of £1,600. 4½% first mortgage debentures, part of series created July 9th, 1904, to secure £50,000., charged on the company's undertaking and property, present and future, including uncalled capital. Previously issued of same series, £31,100.

URAL GOLD.—According to data furnished by the Ural Gold Smelting Laboratory, the quantity of gold submitted to be smelted at that laboratory in the month of August was 8 poods, 5 funt, 2 solotniks, 71 dolie, or about 6 poods, 3 funt less than last year. No gold was offered from the Perm and West Ekaterinburg circuits. For the eight months up to the end of August this year (O.S.), the quantity of gold smelted was 68 poods, 7 funt and 47 solotniks, or 43 poods, 24 funt less than last year.

LILITIA NITRATE CO., LTD.—Registration has been made of a trust deed, dated September 20, 1907, to secure £75,000. debentures, created by resolution of even date. Property charged (specifically): Land and nitrate grounds known as Terrenos Lily, containing about eight Chilian estacas in the Department of Taltal, Chili, with the oficina works, buildings, fixed plant, and machinery thereon. (As a floating security): The company's undertaking and property, present and future, including uncalled capital (if any).

THE RECENT FIRE AT A CHEMICAL WAREHOUSE.

THE fire which occurred at 111, Queen Victoria-street, E.C., on September 24, on the premises of Messrs. Parke, Davis and Co., chemical manufacturers and manufacturing chemists, was the subject of an inquest held by Dr. F. J. Waldo, J.P., the City Coroner, on Friday, at the Golden-lane Coroner's Court. Several firms in the adjoining premises were involved in the outbreak, which would have been much more serious but for the fact that the majority of Messrs. Parke, Davis and Co.'s stock had been removed to new premises. The damage to the various firms concerned is estimated at £6,000.

Mr. W. H. Newton, solicitor, represented Messrs. Parke, Davis and Co., and Col. Fox, chief of the London Salvage Corps, was present in court.

The Coroner, in opening the inquiry, said he was pleased to say the effect of holding inquests into fires in the City of London —the only place in Great Britain—was a distinct diminution in the number and also the severity. At the request of the Coroner, the manager of Messrs. Parke, Davis and Co. then conducted the jury to the scene of the fire, and on returning, Police-constable Phillips said that at 12.30 a.m. on the day of the fire, he noticed a glare in the sky, and immediately telephoned for the fire brigade, who arrived in three minutes. By that time the building was a mass of flame, burning with great fierceness.—District Officer William Oliver Ethernden, of the Carmelite-street station of the London Fire Brigade, said in all 2 horsed escapes, 6 long ladders, 39 steamers, and 233 men were engaged in the work of suppressing the outbreak. They managed to get up the staircase to the third floor, which seemed to be the seat of the fire, but it was not until 2.30 that they got it under, it having such a hold. He was of opinion that a fire had been burning some hours. He found a quantity of patent medicines stored in the place.

Supt. Chas. Allison, of the London Salvage Corps, said the premises were fully insured. He thought it possible that the fire had been smouldering for some hours. He believed in automatic fire alarms, and was of opinion that had one been in use on the premises they would have got to know of the fire much sooner. He noticed no particular smell such as might arise from drugs.

Thos. Blackwell, foreman of the sample department of Messrs. Parke, Davis and Co., said he left the premises at 7.25 p.m. with the foreman packer, Geo. Martin, they having been the only ones on the premises for some hours. All was then safe, and the electric light had been turned off.

Geo. Martin, the packer, corroborated, and in answer to the Coroner said he did not think any chemicals had caught alight, in fact there were no chemicals.

The Coroner: But there were medicines, are they not chemicals? —Witness: Not what you call chemicals.—The Coroner: But I though all medicines were a form of chemicals. Don't you think that medicines or chemicals could have caused it if they caught fire?—Witness: I suppose they could.—The Coroner: Some medicines are very strong, and contain a great deal of vegetable matter.

Mr. Fredk. Melton Fisk, European manager to Messrs. Parke, Davis and Co., said they had a very extensive business in this country. They were manufacturing chemists, but their chemical works were 15 miles out of London. The premises in Queen Victoria-street were insured for £26,000. He had never had anything to do with automatic fire alarms, and had no idea whether they were of any service. Electric lighting was installed throughout, and he was of opinion that a short circuit had occurred between the ceiling of the second and the floor of the third floors, many hours before the place was closed, smouldering until the outbreak. The stock on the third floor comprised medicine chests, pills, tabloids, etc.—The Coroner: You had nothing inflammable such as phosphorus? —Witness: No.

Col. Chas Fox, chief officer of the London Salvage Corps, said there was no trace of what had fired, although he was of opinion that whatever it was had smouldered for hours. He was of opinion that the fire was not caused by the electric light.—The Coroner: Do your think that automatic fire alarms would be of service?—Witness: I certainly do. He had seen both drug and chemical fires, and could hardly connect this one with such as that.

The Coroner said that when inquiring into the great Barbican fire, in 1902, the jury recommended that the authorities should offer a reward for the best fire alarm to be affixed in all warehouses, but nothing had been done.—The jury returned a verdict that the cause of the fire was unknown.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Process for the Treatment of Casein and other Albuminous Substances. R. Desgeorge, 5, Place de la Charité, Lyons, and Francois Lebriel, of 11, Rue Bouchet, Villeurbanne (Rhone). British Patent, 23,789. October 25, 1906.

This invention relates to the treatment of certain substances having an albuminous base, for instance caseine, for obtaining non-inflammable products in imitation of horn, shell, ivory, celluloid and the like.

Either the dry casein of commerce or fresh casein, milk, or the like may be used. To the casein is added a solution of chloride of sodium the strength of which varies according to the degree of transparency it is desired to obtain, for example, 10 parts by weight of chloride of sodium to 100 parts dry casein, with the addition of water to the extent of five times the weight of the casein, produces a good result, but with moister materials 30 to 40% of chloride may be used. The whole is then placed in a vessel into which are inserted metal electrodes of variable nature according to the results required. If, for example, copper electrodes are used, the casein assumes a clear green colour after the passage of the current for some moments, owing to its combination with the copper freed and oxidised by the electrolytic action, and if the operation is prolonged the casein will assume a darker and darker green colour owing to the greater absorption of copper, and will become completely insoluble. The voltage of the current varies according to the number of electrodes, but with electrodes spaced 20 to 25 centimeters apart a tension of 10 to 12 volts is sufficient. The duration of the operation also varies according to the temperature, but when the operation is well conducted 10 minutes is sufficient.

If lead or aluminium electrodes are used the casein will combine with the oxide of the respective metal and become insoluble, but it will not assume any colour; in which case it may be coloured by means of aniline dyes, if desired.

Method of Charging Electric Furnaces for Producing Carbide from Lime and Carbon. A. Peterson, Alby, Sweden. British Patent No. 5,657. March 8, 1907.

The inventor claims:—(1.) The process of continuously producing carbide from lime, which consists in introducing the lime and the carbon separately, and as loose pieces in an electric furnace, in such a manner that separate upright columns of the said carbide-forming materials are maintained in the furnace in close contact with each other, and leading an electric current through the column of carbon for heating the same to a point where the layers of the said carbon and lime columns, that are in direct contact with each other, react to form carbide. (2.) The process of continuously producing carbide from lime and carbon, which consists in introducing the said carbide-forming materials separately, and as loose pieces in an electric furnace in such a manner that the carbon always forms a central column in the furnace, and the lime a column closely surrounding the column of carbon, and in direct contact with the same, and leading an electric current through the column of carbon for heating the same to a point where the layers of the said carbon and lime columns that are in direct contact with each other react to form carbide.

Process for the Manufacture of Hydrated Alumino-silicates or Artificial Zeolites. Dr. R. Gans, 12, Parkstrasse Pankow, near Berlin. British Patent No. 8,382. April 9, 1907.

The inventor claims:—(1.) The herein described process for the manufacture of hydrated alumino-silicates or zeolites in a crystalline form, which consists in fusing together an alumina-mineral, alumina-silicate or aluminate, and an alkali or alkali-carbonate with a sufficient quantity of an inorganic salt, preferably a borate, to ensure that, on the extraction of the melt with water, there remain only crystalline hydrated alumino-silicates. (2.) The process for the manufacture of hydrated alumino-silicates or artificial zeolites in a crystalline form, which consists in melting together kaolin, an alkali carbonate, and borax in the proportions described, and subsequently extracting the melt with water.

Process of Forming Monobasic Organic Peroxides. A. C. Houghton, Syracuse, Orondaga, New York. British Patent No. 9,725. April 26, 1907.

There are many specific compounds of this class to the manufacture of which this process is applicable, of which compounds benzoyl succinyl peroxide, covered in Patent No. 20,680 of 1906, may be taken as a specific case. In general terms the process consists in the treatment of a monobasic aromatic peracid with the anhydride of a dibasic aliphatic acid and the removal of the monobasic organic peroxide formed, by filtration or extraction with a suitable solvent; the process being a general application of the process described in my prior Specification, No. 20,680 of 1906, which describes the formation of the specific compound benzoyl succinyl peroxide, and in which 100 c.c. of a 10% watery solution of benzoic peracid, preferably acidified with acetic acid is agitated with five (5) grammes of succinic anhydride until the reaction is complete, when the benzoyl succinyl peroxide is removed by filtration. The reaction which takes place may be expressed as follows:—$C_7H_6O_3 + C_4H_4O_3 = C_{11}H_{10}O_6$. The compounds formed by this process are characterised by the intense germicidal action of their aqueous solutions. The specific compound benzoyl succinyl peroxide has the formula $C_{11}H_{10}O_6$, and it is further characterised by the following properties:—It is a colourless crystalline body, very soluble in acetone, soluble in acetic-ether, chloroform and alcohol; moderately soluble in benzene; slightly soluble in acetic acid; insoluble in ligroin. It has a melting-point of about 92° C. and decomposes at 96° C.

THE RUSSIAN CHEMICAL MARKETS.

AN Odessa advice states that business in chemicals has declined considerably during the last few weeks. There has been a sharp advance in the price of Berthollet salt; the syndicate that handles the salt has stopped selling. The quotations of other chemicals on the market present no noteworthy feature.

The St. Petersburg market has displayed no special tendency during the month of September, except that a rise in the value of sulphate of alumina has taken place, both for pure and ordinary.

A report on the situation of chemicals at St. Petersburg, dated October 1, stated that there had been no material change during the preceding fortnight, and information from Warsaw, dated October 2, and covering the same period, is to the same effect.

Personal.—The degree of Doctor of Science has been conferred upon Dr. Ludwig Mond by the University of Oxford.

New Chemical Works at Stafford.—At a recent meeting of the Stafford Rural District Council, plans were submitted by Messrs. Chance and Hunt, chemical manufacturers, Oldbury, relating to works buildings which the firm are erecting on land just outside Stafford, for the purpose of the pumping and treatment of brine.

Business Changes.—Messrs. Wilkins, Campbell and Co., of 24 and 25, Great Tower-street, E.C., inform us that they are adding to their business a department specially devoted to the manufacture of fine chemicals. This new department will be conducted by Mr. W. H. Everson, who has had a long experience in the trade.

Market Reports.

THE AMERICAN CHEMICAL MARKET.

NEW YORK, September 30, 1907.

(Rate of Exchange, $4.85 = £1.)

Nitrate of soda is quoted at $2.35. for prompt or future. Sulphate of ammonia is offered at $3.07½. to $3.10. per 100 lbs. Grey muriate, for galvanising, is steady, at 6c. to 6¼c. per lb., while white, for electrical purposes, is offered down to 5½c. per lb., on account of over-supply. Lump carbonate of ammonia is steady at 7⅞c. to 8c. per lb., and powdered is nominally 1c. per pound more. Lump salammoniac, good white seconds, is 9¼c. per lb. Sulphate of copper is weak at 5⅞c. to 6c. per lb. White powdered arsenic is dull at 7c. to 7¼c. per lb., and red Saxony arsenic steady at 7¼c. per lb. Bleaching powders are slow of sale, from $1.20. to $1.25. per 100 lbs. Alkali is quoted 92½c. per 100 lbs., for 58% light, f.o.r., maker's works. Caustic soda, 74%, is quoted at $2.05. per 100 lbs., same conditions. Carbonate of potash, calcined 80-85%, is 3¾c. per lb., and hydrated 4¼c. per lb. Chlorate of potash is 9c. per lb. for powdered, and 8¼c. per lb. for crystals, f.o.r. works; while soda is 8¼c. per lb. Bichromates are steady, at 7¼c. for soda, and 8¾c. per lb. for potash. Prussiate of soda is dull at 9¼c. per lb., while potash is quoted at 15⅞c. to 16c. per lb. The antimony market has a strong tendency, and oxide white is quoted to-day at 10½c. per lb., while needle lump is 7¼c. to 8c. per lb. Oxalic acid is firm at 8c. to 8⅛c. per lb.

TAR AND AMMONIA PRODUCTS.

Friday.

Benzols steady, with values given at 8½d. to 9d. for 90's, and 9d. for 50-90's, casks included. Crude tar, 15s. to 19s. 6d. per ton, Thames; 1¾d. to 1⅞d. per gallon, delivered; refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 25s. to 26s., f.o.b.; Gas Company, 27s.; East Coast, 24s. 9d. to 25s.; West Coast, 24s. Refined naphthalene, £6. 10s. to £10. 10s., packages included. Toluol, 90%, 10d. to 10½d., casks included. Carbolic acid, crude, 50%, 1s. 5½d. to 1s. 5⅝d.; 60%, 1s. 8d.; 75%, 1s. 11½d. to 2s., casks included. Crystals, 39-40%, 5⅝d.; 34-35%, 5d. Cresylic, 95%, 1s. 1d. to 1s. 1¼d. Anthracene, 40 to 45 per cent. A, 1½d. to 1¾d., casks included. Pyridin, 4s. to 4s. 3d.

Sulphate of ammonia steady. Nearest values are:—Beckton, October-December, £12. 5s.; January-April, £12. 7s. 6d.; Beckton terms, £11. 12s. 6d. to £11. 15s.. London, £11. 15s. to £11. 16s. 3d.; Hull, £11. 16s. 3d. to £11. 17s. 6d.; Liverpool, £11. 18s. 9d. to £12.; Manchester, £11. 17s. 6d. to £11. 18s. 9d.; Leith, £12. 3s. 9d.; forward, £12. 5s. Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 9d. Liverpool ordinary, 11s. 3d., and refined, 11s. 4½d.

THE LONDON METAL MARKETS.

Friday.

Copper: Standard brands, £60. to £60. 5s. cash, and £58. 15s. to £59. three months. Tin: G.M. quality, £137. 5s. to £137. 15s. cash, and £135. 10s. to £136. three months; English, £140.; soft foreign, prompt, £19., and November, £18. 10s.; December, £18.; January, £17. 12s. 6d.; English, £19. 10s. Spelter, ordinary brands, prompt, £21. 15s.; December, £21. 10s.; January, £21. 7s. 6d., ex ship; hard, £19., f.o.b. Antimony, £42. to £44.; ore, £14. Bismuth, 6s. 6d. Quicksilver, £8. 5s.; seconds, £8. 3s. 6d. Nickel, 1s. 10d. per lb. Aluminium, £140. to £145. Wolfram, 40s. Pig-iron closing prices: Cleveland, 53s. 10½d. cash, and 53s. 1½d. one month.

MISCELLANEOUS CHEMICAL MARKET.

Thursday.

The general demand for chemicals continues fairly active both for home and export trade, and prices all round keep firm for present as well as future delivery. A good deal of business has been already concluded for deliveries over 1908. In the alkali trade values are firmly upheld by the higher costs of raw materials, but for some reason, contrary to the general tendency the quotation for soda crystals has been reduced, and now stands at 57s. per ton (in bags), f.o.r. Alkali, 58%, is unchanged at £4. 10s., f.o.r. Caustic soda, 70%, £10. 5s., f.o.b. Saltcake in bulk, 42s. 6d. per ton. Bleaching powder is steady, at £4. 7s. 6d. f.o.r. and f.o.b. Chlorates, 3½d. per lb. Sulphur, £4. 15s. per ton. Prices are very firm for carbonate of potash, 90%, at £19. and caustic potash, 87-90%, at £25. 10s., for prompt. Acetate of lime, 80%, is steady at £12. 10s., c.i.f. Acetic acid, 60%, £19. 10s. White sugar of lead, £30. to £31.; brown, £26. 10s. Nitrate of lead, £31. 10s. Sulphate of copper nominally £22. 15s., but price has a weaker tendency. Prussiates are firm in price, and business is active—soda at 3¼d., and potash 5⅝d. to 6d. Arsenic is very firm at £32. Ammonia and ammonia salts are firm in price for all descriptions.

LIVERPOOL OIL AND COLOUR MARKET.

Thursday.

OILS.—Palm oil firm, with a fair business reported, sales including hard oils for November delivery at £27. 5s., and for October-November and December-January delivery at £27. 10s.;

Digitized by Google

soft oils on spot, £28. 2s. 6d., November-December delivery £28. 5s., and December-January delivery £28. 10s.; Old Calabar, on spot, £28. 5s.; Qua Eboe, for October-November, £29., oil in transit. Linseed oil quiet, at 27s. to 27s. 6d. per cwt. for Liverpool makes in export casks. Cottonseed oil quiet, at 28s. to 29s. per cwt. for Liverpool refined in export barrels. Tallow firm, at 32s. 3d. per cwt., c.i.f. terms, for South American beef. Turpentine firmer, at 39s. 9d. per cwt. for spot parcels. Petroleum in moderate request, at 6¾d. for Russian and Roumanian, and 7¼d. to 8¼d. per gallon for American refined oils. Petroleum spirit steady at 1s. 0½d. to 1s. 3d. per gallon.

COLOURS.—Red lead, English, £21. 10s., white, £22. 10s. to £22. 15s.; emerald green, 1s. per lb.; Brunswick green, 16s. to 45s. per ton; venetian red, lump, 7s. 6d., powder, 5s. to 6s. 6d. per cwt.; vermilion, English, 2s. 4d., China, 3s. per lb.; Prussian blue, 1s. 10d. to 2s. 6d. per lb., Brunswick, 28s. to 34s. per cwt.

LIVERPOOL DRYSALTERIES.

Thursday.

Montreal potashes quiet, but well held at 35s. 9d. per cwt. Pearl ash nominal. Logwood steady. Cutch quiet. Gum copal: Gold Coast sold at auction, 52s. to 74s. per cwt. Castor oil firm in all positions at 3¾d. for good seconds Calcutta on to January next, and 3¾d. on spot; French offering at 3½d. for first pressure, and 3¼d. for second pressure. Gambier: Block, 21s. 6d. to 22s. 6d. per cwt. on spot, October-November shipment, 19s. 6d., and December-January shipment, 19s. 3d. Cubes, 30s. per cwt., on spot, 28s. for September-October shipment, and 27s. 7½d. per cwt. for October-November and November-December shipment. Shellac steady, at 145s. to 147s. 6d. for fair TN orange, on spot. Glucose firm: American liquid, 43°, 12s. 6d. on spot, and 12s. for October-December delivery; for prompt shipment, 10s. 3d., and for October-December, 9s. 9d., c.i.f., for shipment. American powdered starch, 10s. 9d. on spot, and 10s. 3d., c.i.f., for shipment. Pearl, 10s. 3d. on spot, and 9s. 9d., c.i.f., for shipment. Cream of tartar, 98% foreign powder, 86s. to 87s.; 95%, 84s. to 85s. Tartaric acid: English, 11½d. on spot, and foreign, 11d. Citric acid: English, 1s. 9d. to 1s. 9½d.; foreign, 1s. 9½d.

HULL PAINT, OIL, AND COLOUR REPORT.

Thursday.

OILS.—Linseed oil during the week advanced upon last prices, but has since fallen rapidly, closing about £1. per ton lower upon the highest quotation. Refined cotton oil has also declined by 15s. to 10s. per ton, closing quiet. Turpentine has improved, closing firm and dearer. Amongst the principal imports here to date, as against the same time a year ago, are:—Wheat, 3,254,705 qrs., against 3,185,014 qrs.; flour, 165,905 cwts., against 284,927 cwts.; linseed, 636,573 qrs., against 472,794 qrs.; rapeseed, 99,454 qrs., against 89,472 qrs.; cottonseed, Egyptian, 133,752 tons, against 120,527 tons, other kinds, 142,606 tons; against 105,054 tons; oilcake, 20,663 tons; against 32,290 tons; hemp, 102,904 cwts., against 129,865 cwts.; olive oil, 3,663 tuns, against 3,193 tuns; tar, 12,633 barrels, against 10,605 barrels. Amongst the weekly imports are:—Margarine, 2,462 cwts.; lard, 4,576 cwts.; oilcake, 149 tons; colours, 3,237 packages; wool, 952,778 lbs. Exports:—Oil, 10,164 cwts.; colours, 2,874 packages; chemicals, 1,961 packages. Linseed oil closes quiet at 24s. 7½d., naked, spot; October-December, 23s. 10½d.; January-April, 22s. 9d.; boiled and refined, £1. to £1. 10s. per ton extra. Exports during the week:—15 tons Austria, 10 Belgium, 2 Denmark, 8 Germany, 2 Norway; total, 37 tons. Refined cotton oil quiet, 23s. 9d. spot, naked; October, 23s. 6d.; November-April, 22s. 7½d.; casks £1., and barrels £1. 7s. 6d. per ton more. Exports for the week:—25 tons Belgium, 3 Denmark, 5 France, 69 Germany, 64 Holland, 2 Norway, 3 Sweden; total, 171 tons. Cottonseed inactive, spot (old), £7. 2s. 6d., new, £7. 10s. paid, £7. 6s. 3d. to £7. 3s. 9d. on passage, October £7. 2s. 6d., November-January £7. 1s. 3d.; Bombay, October-November, £6. 2s. 6d. sellers, £5. 19s. 6d. buyers. Linseed, La Plata, 45s. 6d. accepted, September-October 45s. 9d., October-November 45s. 9d., December-January 43s. 6d., January-February 42s. 9d. accepted. Turpentine, 39s. 9d., November-December 40s. 6d., January-April 41s. 9d., May-June 40s. 9d. Rosins unchanged. Olive oil, Levant, £39. to £40. per tun. Castor oil unchanged. Cod oil, £16. to £19.

CAKES.—Linseed cakes very firm, some makes being 2s. 6d. per ton higher; cotton cakes, best makes scarce, and in improving demand.

TYNE CHEMICAL REPORT.

Thursday.

Market firm, with a steady demand. Caustic soda, 70%, £10. 5s. per ton, and 76-77%, £11. per ton. Soda crystals, locally, £3. to £3. 2s. 6d. per ton, gross weights. Bleaching powder steady, at £5. to £5. 5s. per ton. Sulphur firm, at £5. to £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £29. 10s. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—For prompt loading the market is quiet and rather easier. To-day's quotations:—Best Northumbrian steam, 15s. 3d. to 15s. 9d. per ton; second qualities, 14s. 3d. to 14s. 9d. per ton; small coals, 10s. 6d. to 11s. per ton; best gas coals, 15s. to 16s. per ton; Durham bunker coals, 13s. 3d. to 14s. per ton; coking coals, 14s. 6d. to 15s. per ton; household coals, 16s. 6d. to 17s. per ton; gas coke, 20s. per ton; foundry coke, 23s. to 24s. per ton.

WEST OF SCOTLAND CHEMICALS.

Glasgow, Thursday.

The long continued stationary feeling in sulphate of ammonia, Leith deliveries, seems to have come to an end, the movement during the past week having quickened, and prices have gone up a little for prompt business. Forward dealing also follows the same tendency, and sales are reported up to £12. 5s., though this requires full confirmation. Sulphate of copper is still unsettled, and the general tendency has been downward, though with no great actual change. Good business continues in the ordinary heavy chemicals, both spot and deferred, and prices are firmly held. Caustic soda is steady at the recent advance, and forward inquiry is more active. Saltcake retains late improvement. Mineral oils and paraffins are all as before in values, with an increasing movement in the deliveries of burning oil and paraffin spirit.

Chief prices current are:—Alum (in lump), £5. 5s. to £6., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 12s. 6d. to £4. 17s. 6d., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3½d., nett, Glasgow; creosote (ordinary coal-tar and blast furnace), 2¼d. to 2½d., naked, f.a.s. Glasgow; nitrate of soda, 11s. 4½d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2¾d. to 2½d. per lb.; paraffin wax, 120°, semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¼d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating) 865°, £5. 15s. to £6. 5s.; 885°, £6. 7s. 6d. to £7. 7s. 6d.; 890-895°, £7. 2s. 6d. to £8. 2s. 6d.; prussiate of potash, 5¾d. to 5¾d., nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £3. to £3. 2s. 6d.; sulphate of ammonia, £12. 3s. 9d. to £12. 5s., prompt, f.o.b. Leith; sulphate of copper, £22. 10s., to £23., less 5% Liverpool, prompt.

New Companies

British Cellulose Syndicate, Ltd.—Capital £12,000., in £1. shares. This syndicate has been formed to acquire any interests in inventions relating to the manufacture of artificial silk, to acquire the undertaking and all or any of the assets and liabilities of the Cellulose Products Syndicate, Ltd. (incorporated in 1907), etc. No initial public issue. The first directors are J. H. Hoyle, J. Williams, and E. J. Sampson. Remuneration, £250. per annum, divided.

C. Happach and Co., Ltd.—Capital £35,000., in £1. shares (10,000 preference). This company has been formed to carry on the business of brokers and refiners of, agents for and dealers in sugar, caramels, saccharum, and other similar materials or manufactured products and chemicals, commission merchants and agents, etc. No initial public issue. The first directors are C. Happach, H. Meyer, and A. Kahler.

Cropwell Gypsum Mines, Ltd.—Capital £10,000., in £1. shares. This company has been formed to acquire the business carried on at Cropwell Bishop, Notts., as the Snaith Plaster and Cement Co., Ltd., to search for, work and deal in gypsum, iron, coal, clay, earth and other minerals. No initial public issue. The first directors are E. Gerrish, E. J. L. Symonds, and D. W. Snaith. Qualification, £300. Registered office, Cropwell Bishop, Notts.

D.E.M.P. Syndicate, Ltd.—Capital £7,750., in 1s. shares. This syndicate has been formed to acquire the benefits and obligations of agreements between the Zinkgewinnungs-Gesellschaft m.b.h., of Berlin, of the one part, and G. Evans of the other part, whereby certain working rights with respect to the Rudolph Deposits at Beuthen, Upper Silesia, are conferred on the said G. Evans, with a view thereto to enter into an agreement with F. W. Macan and S. Peck, and to carry on the business of miners, etc. No initial public issue. The subscribers are to appoint the first directors. Qualification, 5,000 shares. Remuneration, £100. each per annum (chairman £150.). Registered office, 8, Laurence Pountney Hill, E.C.

Gardner and Sons, Ltd.—Capital £2,000., in £1. shares. This company has been formed to carry on the business of manufacturers of and dealers in asphalte, pitch, tar, oil, bricks, tiles, pipes, terra-cotta, stone, sand, lime, cement, timber, hardware and building requisites, etc. No initial public issue. Registered without articles of association. Registered office, 8, Princes-street, Westminster.

Industrial Spirit Supply Co., Ltd.—Capital £1,000., in £50. shares. This company has been formed to promote the sale and manufacture of spirits for industrial purposes, etc. No initial public issue. The number of directors is to be half the number of shares in the original capital for the time being issued. The holder of an original share bearing an odd number and the holder of the share bearing the next even number may appoint one of themselves as a director.

Java Rubber Plantations, Ltd.—Capital £35,000., in £1. shares. This company has been formed to acquire and work the rubber estate in Java known as the Soember Tengah Estate, and to adopt an agreement with the Rubber Estate Agency, Ltd. Minimum cash subscription, 19,500 shares. The first directors are F. Copeman, J. C. Tate, H. Wright, and J. W. Ramaer. Qualification, £200. Remuneration, £100. each per annum (chairman £150.). Registered office, 59, Eastcheap, E.C.

Lanadron Rubber Estates, Ltd.—Capital £320,000., in £1. shares. This company has been formed to acquire (1) about 1,581 acres of land at Muar, Johore, Malay Peninsula, to acquire the business of planters of rubber and other produce, carried on by the Lanadron Estates, Ltd., (2) about 7,200 acres of land, also at Muar, and the business carried on by the Jementah Rubber Co., Ltd., and (3) about 2,000 acres of land in the same locality, or a permit or right to select the same, belonging to F. Pears. Minimum cash subscription, £20,000. The first directors are F. Pears, F. W. Barker, C. W. Drabble, and T. Pears. Qualification, £250. Remuneration, £150. each per annum (£200. for the chairman). Registered office, 6, Lloyd's-avenue, Fenchurch-street, E.C.

Rubberite, Ltd.—Capital £100., in 5s. shares. This company has been formed to acquire and turn to account any interest in any patents, inventions, concessions, licences and the like relating to the manufacture of rubber, guttapercha, or caoutchouc, or any substitute therefor, etc. No initial public issue. Registered without articles of association.

Borate of Lime—
A'fagasta, 3,581 bgs. Borax Consolidated
Mollendo, 2,813 "

Castor Oil—
Antwerp, 28 brls.

Colours—
Antwerp, 3 cks. 5 cs.

Copper Pyrites—
Huelva, 2,207 t.

Dyestuffs—
Bark Extract
Philadelphia, 5 brls.

Iron Ore—
S. Cabullo, 2,400 t. R. J. Forfar & Co.
Larms, 5,350
Scriphos, 3,100 A. B. Craig

Linseed Oil—
Antwerp, 30 brls.

Lithopone—
Antwerp, 60 cks.

Manure—
Lisbon, 12 bgs.

Rosin—
Baltimore, 2,600 brls.

Soap—
Genoa, 98 cs.

Soda Crystals—
Antwerp, 3 bgs.

Sodium Chlorate—
Antwerp, 8 brls.

Starch—
Antwerp, 100 cs.

Wax—
Baltimore, 489 brls.
Philadelphia, 233

TYNE.

Week ending October 5.

Antimony Ore—
Antwerp, 2,045 bgs. J. Arnott & Son

Asbestos—
Hamburg, 8 bls. Tyne S.S. Co.

Barytes—
Rotterdam, 301 bgs. Tyne S.S. Co.
Antwerp, 200 J. Arnott & Son

Calcium Carbide—
Trondhjem, 600 dms.

Carbonite—
Nassluis, 750 cs. T. Riche & Co.

Castor Oil—
Antwerp, 27 brls. J. Arnott & Son

Dyestuffs—
Tannin Extract
Bordeaux, 10 cks.

Farina—
Amsterdam, 20 bgs. W. Swanston & Sons

Glucose—
New York, 300 brls. J. Arnott & Son

Paraffin Scale—
New York, 902 brls. J. Arnott & Son

Rosin—
Bordeaux, 56 cks.

Tallow—
New York, 157 cks. J. Arnott & Son

Zinc Oxide—
New York, 150 brls. J. Arnott & Son

GOOLE.

Week ending October 5.

Barytes—
Rotterdam, 57 cks.

Bog Ore—
Harlingen, 64 t.

Caoutchouc—
Boulogne, 15 cks. 1 cs.

Chemicals (*otherwise undescribed*)
Antwerp, 135 bgs.
Boulogne, 2 cks.

LATE ADVERTISEMENTS.

TENDER.

COUNTY OF LONDON.

THE London County Council invites tenders for the supply and delivery of:—

Chemicals, medicines first-aid appliances, etc., and chemical apparatus, etc., for one year from 1st January, 1908.

Full particulars, and also information as to the conditions to be observed by tenderers, are given in the "London County Council Gazette" of the 28th inst. (price 1d., post free 1½d.), which can be obtained from Messrs. P. S. King and Son, 2 and 4, Great Smith Street, Westminster, S.W.

Standard samples may be seen at Westminster Bridge Wharf, No. 1, Belvedere Road, S.E., from Monday, 28th October, until Saturday, 9th November, 1907, between the hours of 10 a.m. and 4 p.m. on any week day excepting Saturday, when the samples may be seen between the hours of 10 a.m. and 1 p.m.

The Tenders must be upon the official forms, to be obtained on personal application or by sending a stamped addressed foolscap envelope to the Clerk of the Council County Hall, Spring Gardens, S.W., and no tender will be received after 11 a.m. on the 11th November, 1907.

G. L. GOMME,
Clerk of the London County Council.

County Hall, Spring Gardens, S.W.
24th October, 1907.

ASSISTANT MANAGER, CHEMICAL WORKS.

THE Bradford Corporation require the services of an Assistant Manager of the Chemical Works. Salary, £120 per annum. Preference will be given to applicants who possess a good knowledge of chemistry.

Applications, stating age, occupation, and experience, accompanied by copies of not more than three recent testimonials (which will not be returned), and marked on cover "Assistant Manager, Chemical Works," to be sent to me on or before Saturday, 16th November next.

Canvassing members of Council will disqualify.

23rd October, 1907. FREDERICK STEVENS, Town Clerk.

DISMANTLING OF CHEMICAL WORKS AT CRAYFORD, KENT.
TO CHEMICAL MANUFACTURERS, OIL WORKS, AND OTHERS.

FOR SALE, piecemeal, an entire plant, in good condition, consisting of Boilers, Tanks of all sizes, Cast-iron Pans, Vertical Steam Engine, Cornish Boiler, two Hydro Extractors, 3 tons Steam Bogie Crane, Horizontal Engine with Stone Crusher, Pumps, Stills, Jars, etc., etc.—For prices and particulars, apply to Thos. W. Ward, Ltd., Albion Works, Sheffield.

QUALIFIED Chemist, with considerable manufacturing experience, rapid technical analyst, now disengaged, desires appointment.—"1,549," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

MANAGERSHIP of Sales Department or other responsible position required. Good organiser, up-to-date knowledge of "follow-up" systems, etc. Excellent experience and testimonials.—Box "1,550," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

CURRENT TOPICS.

THE NEW PATENTS ACT.

THE new Act amending and consolidating the law relating to patents, designs, and trade marks (the text of which appears elsewhere in this issue), was the subject of a very interesting speech by Mr. Lloyd-George, the President of the Board of Trade, at Manchester last week. Mr. Lloyd-George was the guest of the members of the Manchester Chamber of Commerce, at their annual dinner, and in referring to the work of the Chamber he alluded to the prominent part which that body had played in the reform of the Patent Laws. The President of the Chamber had said that the Patents Bill was their child; Mr. Lloyd-George wittily added that he himself was the nurse. He had received great assistance from Sir William Holland, and also from Mr. Ivan Levenstein and Sir Joseph Lawrence. Mr. Levinstein (continued Mr. Lloyd-George) had fought this matter out with great tenacity and courage, and he now had his reward. The Act was out, and it must not be a dead letter. It was one thing to have a good Act on the Statute Book, but it was another thing to see that it was enforced. The difficulty in this country is, in the opinion of the President of the Board of Trade, an absence of organisation, which has brought out the quality of the individual, but with Acts of Parliament like this we must get organisation.

Mr. Lloyd-George then paid a high tribute to Mr. Levinstein's efforts in connection with Patent Law reform. He observed that we had patent laws before which contained the principle of compulsory working, but they were left to Mr. Levinstein to put into operation. No one man could undertake a burden of this kind, but a cheaper method of procedure had now been provided. The Government had done their best to eliminate the lawyer. Said Mr. Lloyd-George, "You know the old adage, set a poacher to catch a poacher! It is cheaper."

Continuing, the President of the Board of Trade dealt with the question of patents taken out in this country and worked abroad. He has had prepared a list of these patents, which, he told the Manchester Chamber of Commerce, were very numerous. Some of them were no doubt insignificant, others were not very valuable, but some of them were of enormous value, covering practically every branch of industry. This means that every one of these patents registered here and worked abroad is excluded from operation in this country.

Mr. Lloyd-George urged that it is really worth while making an effort to see that the new Patents Act shall be a reality and not a sham. It is a reality as far as its powers are concerned, but the question as to whether it will be a reality in its operation depends, in his opinion, on the amount of co-operation between the Chambers of Commerce and the Board of Trade.

Digitized by Google

Passing on to the working of the Act, the President stated that a list was being prepared of patentees who now would be subject to the provisions of the Act as to working in this country, and such patentees would be asked to explain what adequate reason exists for the non-working of such patents. Mr. Lloyd-George appealed to the Associated Chambers of Commerce to put themselves into communication with the Board of Trade, and to help that department to find out some method "whereby the initial steps shall be taken to call upon these hundreds of foreign patentees to assign good reason for using this monopoly, granted by the Crown, for the purpose of excluding Britishers from setting up industries in this country."

We do not propose to discuss the merits of the new Patents Act, nor the benefit to British trade which may result from the application of the principle of compulsory working; but we would join with the President of the Board of Trade in his handsome acknowledgment of the good work done in the cause of Patent Law reform by the members of the Manchester Chamber of Commerce and by the national Association of Chambers. The success which has attended the co-operation of these bodies with the Board of Trade augurs well for the future influence of such organisations upon Government policy and legislation. The thanks of the industrial community are due to the energetic head of the Board for the progress which has been made in this direction, and, in common with chemical manufacturers in general, we shall watch with great interest the application and working of the new law.

THE TRADE "BOOM" IN GERMANY.

It is the opinion of some authorities on German industrial conditions that the era of prosperity which has continued uninterrupted for several years past is approaching its end, and that business is on the verge of a decline. The general opinion is, however, that if commercial activity has suffered a check, it has only stopped to take breath in order to make a fresh start; and the setback, if any, is to be ascribed to the tight money market. The demands on the banks have been so great that they have had difficulty in accommodating their customers. For more than a year the rates of discount have been unusually high; Government and other gilt-edged securities have considerably fallen; but this is explained by the fact that people think they can employ their money better than by investing in securities which yield such a little return. Cities and towns which formerly borrowed at 3 or 3½% find it difficult to place loans at 4 and 4½%. The United States Consul-General at Brunswick observes that the tight money which has been produced by prosperity has in its turn acted as a curb, so that the prosperity does not exceed reasonable bounds and bring ruin on the business community.

RUBBER CULTIVATION IN INDO-MALAYA.

The frequent registrations of new rubber-growing companies are a measure of the efforts which are being made to increase the supply of rubber. The editor of the *India Rubber Journal*, in a survey of the world's rubber industry, observes that in view of the youthfulness of the rubber-growing industry the money at stake is expressive of keen admiration of the efforts already put forward. Ceylon leads the way for planted acreage, owing, no doubt, to its wide range of climatic conditions, its experienced European planters, and the cheapness of its coolie labour. The high price of the land is, however, a deterrent to those willing to invest their money in rubber cultivation. Malaya has many advantages of climate and facilities for securing land for rubber-growing, and is, in some ways, viewed with greater favour than Ceylon; it has disadvantages, however, in having to pay a high price for its labour, and in having no dry period.

In S. India there were, in 1906, about 13,000 acres under cultivation, and since then several companies have made developments. Parts of Java, Sumatra, and Borneo possess rich soils and suitable climates where land can be secured on reasonable terms. In some of these islands, species other than *Hevea Brasiliensis* can be cultivated more profitably than in Indo-Malaya. Para rubber trees will even grow more rapidly in some parts of the islands than in Ceylon or Malaya.

NORWEGIAN WATER-POWER AND FOREIGN CAPITAL.

The King of Norway has given his assent to an Act dealing with the utilisation of water-power. This Act provides that embankment works cannot be taken in hand without the King's consent when the water used by the undertaking is increased to at least 3,000 horse-power. The Act is the outcome of the recent attack on the Government, in which the Administration was accused of injuring the interests of the country for the advantage of foreign capitalists. The Storthing adopted the Act without any noteworthy discussion, although it was opposed by the Government on the ground that the proposal was a rupture of traditional customs and an interference with private rights in property. The Government itself had, however, already embarked upon this path by having established the principle that the natural riches of Norway represented State property, and that, consequently, the State could utilise those riches to its own advantage.

NITRATE OF SODA.

THE market has developed much weakness since our report of 12th inst., owing to the unsatisfactory state of affairs in Chili, where the large accumulation of stocks and the strained condition of the money market have induced a pressure of sales. Financial difficulties in Hamburg have also increased the uneasiness of holders, and although quotations there are only nominally lower, considerable concessions would be necessary in order to attract buyers. Nitrate for prompt shipment from the West Coast has been sold down to 8s. 6d. per quintal, f.o.b., and is nominally quoted 10s. 6d. per cwt., cost and freight, the respective values at this time last year being 9s. 6d. and 11s. An arrived refined cargo is said to have changed hands at 10s. 3d., and ordinary quality in the same position would not fetch much, if anything, above 10s. per cwt., cost and freight. The cargo that has been awaiting orders at Plymouth for nearly three months has at last been sent unsold to Liverpool, to which port yet another of 2,500 tons has been ordered, making the stocks there over 13,000 tons, against 7,000 tons a year ago! The total European stocks are about 165,000 tons, compared with 120,000 tons at this time last year, and many July sailings are now due. Out of 190,000 tons loading in Chili on October 1, 70,986 tons were cleared up to 15th inst—including a number of fast German ships due here early in January before the opening of the season—and, as was to be expected, very moderate estimates of the month's total for Europe are being circulated. The official figure of 147,422 tons is supposed to have helped to stiffen the market, but business is conspicuous by its absence. The predominant feature is the complete indifference of consumers, who are content to wait to see how the nitrate cat jumps.

Serious Explosion at an American Powder Factory.—A disastrous explosion occurred on Tuesday week at the Dupont Powder Mills, near Fontanet, Indiana. The mills were completely destroyed, and extensive damage to the town of Fontanet resulted. A large number of workpeople and others were killed, while according to the reports in the daily Press a still larger number were more or less seriously injured.

C.I.F. SHIPMENTS.

A CORRESPONDENT recently called attention to the confusion existing as to the exact meaning of the familiar terms, "c.i.f.," and "f.o.b." The same subject has been discussed in other journals, and we quote the following interesting article from the *Manchester Guardian*.

A question having been raised in these columns as to the legal responsibilities of shippers in regard to goods exported on "c.i.f." terms, it may be said that judicial decision appears to be only slightly more definite than that of the commercial community. In 1871 Mr. Justice Blackburn, in the case of Ireland *v.* Livingstone, said:—"The terms at a price" to cover cost, freight and insurance by acceptance on receiving shipping documents "are very usual, and are perfectly well understood in practice. The invoice is made out debiting the consignee with the agreed price (or the actual cost and commission, with the premiums of insurance, and the freight, as the case may be) and giving him credit for the amount of freight which he will have to pay to the shipowner on actual delivery, and for the balance a draft is drawn on the consignee, which he is bound to accept (if the shipment be in conformity with his contract) on having handed to him the charter-party, bill of lading, and policy of insurance. Should the ship arrive with the goods on board he will have to pay the freight, which will make up the amount he has engaged to pay." He further describes the contract as "one by which the one party binds himself absolutely to supply the goods in a vessel such as is stipulated for, at a fixed price, to be paid for in the customary manner—that is, part by acceptance on receipt of the customary documents and part by paying the freight on delivery; and the other party binds himself to pay that fixed price." In actual practice to-day the more "customary manner" is for the exporter to pay the freight on shipment. But as he still charges the consignee with this, it is arguable that he only pays it as the consignee's agent. Against this suggestion of agency is the fact that in case of loss of the goods on the voyage he cannot recover the freight from the consignee, who has never received the goods.

The question is, what does the exporter contract to do? The term c.i.f. refers to the price, but it is used in connection with other terms of the contract, *e.g.* "port abroad—October delivery." Now in the case of Wancke *v.* Wingren (58, L.J.Gr.B., 519), a c.i.f. contract provided that goods were to be shipped by the seller in Sweden and sent off to one of three English ports, at the buyer's option. The Courts—Day and Smith J.J.—recognised that although the freight was charged by the seller, the buyer would in effect have to pay it on the discharge of the goods—as in Mr. Justice Blackburn's dictum. Placing the emphasis on the condition "to be shipped," they made the moment of shipment that at which the risk shifted to the buyer, the exporter having then finished all he contracted to do. If "port abroad" is, as it seems to be, equivalent to "to be shipped," the logical conclusion would be that by shipping in October, under such terms, the exporter performed his part of the contract, and would be under no further liability. The Court has never specifically construed a c.i.f. contract (without such further conditions) in such a way as to determine the moment when the risk shifted, *i.e.*, when the property in the goods passed from the exporter to the consignee. In Delaurier *v.* Wyllie, a Scotch case reported in 17 Sess. Cases, Lord M'Laren said: "In the absence of other elements of evidence or implication from the contract itself, I should be disposed to think that a sale expressed to be inclusive of cost, freight, and insurance, is a sale of goods deliverable at the port of arrival, and that the property of the goods does not pass until the completion of the voyage, unless something more is done to anticipate the passing of the property," but he expressly reserved his opinion as to the meaning of the abbreviation, and other members of the Court did not agree with him in his disposition. Lord Traynor said that the special obligations implied by "c.i.f." had no reference to the question of delivery. "I think," he added, "the question as to what delivery is sufficient to free the seller of risk and where such delivery is held to be made are not affected by these additional obligations" (*i.e.*, to insure the goods and pay the freight), "but are to be decided according to the ordinary rules of law applicable thereto. . . . It still remains that the contract c.i.f. does not stipulate for delivery at a certain place. If the defenders had averred that by the custom of merchants a contract c.i.f. meant, and was universally recognised as meaning, a contract under which the seller bound himself to deliver at the port to which the goods were consigned, that would have been a different matter. But no such custom is averred." Lord Wellwood went further than this, and said, "The meaning and effect of the expression c.i.f. simply is that the sellers undertake to insure for the purchaser and include in the invoice price the cost of the cargo, the insurance premium, and the full freight. From this they deduct the amount of the freight to be paid at the port of discharge and draw for the balance on the consignee." This is incidentally supported by Lord Shand, who speaks of the insurance that the exporter effected as being one that would cover any loss that the consignee might sustain, and Mr. Justice Blackburn, in the earlier case we have cited, says: "Should the goods not be delivered in consequence of a peril of the sea, he" (the consignee) "is not called on to pay the freight, and he will recover the amount of his interest in the goods under the policy."

The inference here is that the insurance is effected on behalf of the consignees. The Court says that the insurance premium is in effect paid by the consignee, and the moneys recoverable under the policy are payable to him. Is not the logical conclusion that during the period covered by the policy—*i.e.*, the voyage—the goods are at the risk of the consignee? On this view the term c.i.f. looks like one of commercial convenience. The foreign consignee buys in the English market, but as the scale of insurance and freight are more easily ascertainable by the English exporter he says in effect to the latter, "You insure the goods and pay the freight and include these charges in your price," which results in a c.i.f. contract. It is the exporter's duty to insure sufficiently and to ship under such a bill of lading as will ensure the goods' delivery at the port of discharge mentioned in the contract [Lecky *v.* Ogilvy, 3 Comm. Cases, 29], but these would seem to exhaust the "additional obligations" implied by a c.i.f. contract. If this is the correct view, delay in transit is clearly, as suggested by our correspondent, at the consigner's risk.

But there is no doubt that among shippers themselves there are many who take quite a different view of their obligations under a c.i.f. contract. To these the liability only ends with delivery at the port of discharge. They effect the insurance in their own names and on their own behalf. If the goods do not arrive they recover what they can from the insurance or shipping company (as the case may be), and make what terms they can with their consignee for non-delivery. In this relation, they, of course, make prudent provision against a possible rise in the market, and delay in transit probably becomes a subject for "allowances," in which the shipping company becomes indirectly implicated. It is all straightforward and reasonable enough, but it is not flush with what the judicial interpretation of the contract would seem to be, nor does it appear to obtain so widely as to suggest the likelihood of its being judicially accepted as a mercantile custom.

PERSONAL.—Mr. Thomas Cantrell, the late secretary of the well-known engineering firm of Manlove, Alliott and Co., Ltd., of Nottingham, was on the 7th inst. presented with a silver tea service and salver, subscribed for by the directors, staff, and workmen, in recognition of his forty-six years' connection with the firm. Mr. Cantrell joined the Company in 1861, being appointed secretary when the firm was registered as a limited company. Failing health, however, made it necessary for Mr. Cantrell to retire recently, to enjoy a well-earned rest after nearly half-a-century's busy life.

GERMAN ITEMS.—The Phœnix Mining and Foundry Company obtained in year ending 30th June, the following by-products:—Sulphate of ammonia, 4,640 tons, against 2,257 tons in the previous twelvemonths; 10,935 tons tar; 952 tons raw benzol; 813 tons refined ditto; 2,874 tons pitch; 1,283 tons tar oil; 521 tons raw naphthaline; and 166 tons anthracene. The Union Mining and Steel Company increased its output of sulphate of ammonia from 639 tons to 1,674 tons, and is putting up 80 more coke ovens. The Märkisch-Westphalian Mining Company produced 10,887 tons of 60% sulphuric acid, against 10,966 tons in 1905-6. On account of the lateness of the harvest in Germany the demand for manures is so slight that many agricultural associations are countermanding their orders for ammoniacal superphosphate. The Hungarian manure manufacturers have come to an understanding for the maintenance of prices, an example which might with advantage be followed by their British confrères; these latter continue to cut each other's throats by selling at cost price, in spite of the sensational advance in wheat and other cereals.

CHEMICALS IN THE UNITED STATES.

SAVANNAH.

HIGH prices and reduced output in articles such as cotton, turpentine, timber, etc., were the chief features of last year's trade in Savannah. Cotton receipts were only 1,520,857 bales, a decrease of 350,000 bales compared with the previous year, the decrease being attributable to the smaller crop that was produced in the cotton States. Though the decrease in cotton receipts was considerable, if taken by itself, it was proportionately less in relation to the total crop grown than was the reported falling-off at several of the other cotton ports. Taken as a whole, the year's business shows Savannah to be rapidly approaching New Orleans as the second cotton port of the United States.

Naval Stores.—The production of resin, tar, spirits of turpentine, etc., has about reached its limit, owing to the gradual exhaustion of the pine trees; nevertheless, important business is still being done in this branch of trade.

The last naval stores season, which opened on April 1, 1906, was disappointing alike to producers and factors; labour was unsatisfactory, and the weather was unfavourable. Turpentine farmers were seriously handicapped by excessive rains at the beginning of the year, and there was a lack of reliable negro labour, on which the producer has almost solely to depend. Chinese labour, which was tried last season, proved a failure in the turpentine farms, and Italian labour, while showing somewhat better results, is still considered of doubtful value for turpentine work. Most of the resin and turpentine exported from Savannah is received from the pine sections of Georgia, Florida, and Alabama, and great damage was done last autumn throughout this territory by destructive storms and forest fires, which injured many of the turpentine "boxes," as the receptacles cut in the sides of the trees are called, which collect and hold the resinous sap.

Quotations for the leading grades of resin and spirits of turpentine were generally high throughout the year, with moderate fluctuations, and there is little prospect of any marked reduction in values in view of the probably decreased product next season. The receipts of naval stores at this port last year show some increase in the total number of packages of resin and turpentine, which is due to the fact that much of the Florida output is now brought here as parts of through cargo on vessels taking on naval stores at Fernandina and Brunswick, and then coming to Savannah to complete loading with other merchandise for foreign ports.

British interests continue about the same. There is an increase of British steamers at the port of Brunswick; about three-quarters of the total foreign carrying trade is done in British vessels. During the last part of 1906 and the beginning of 1907, much trouble was experienced by shipping and other interests owing to the delay in delivery of shipments by railway companies; a state of affairs caused by strikes, deficiency in rolling stock, and various other causes.

Imports of Chemicals, etc.

The following were the principle articles of import at all the ports of Savannah during the years 1904-1906. The figures are abstracted from a British Consular report just issued.

	Quantities. 1904.	1905.	1906.	Character of trade: From

THE NEW PATENTS ACT.

THE following is the full text of the "Act to consolidate the enactments relating to Patents for Inventions and the Registration of Designs and certain enactments relating to Trade Marks," to which reference is made in our editorial columns.

Part I.—Patents.

Application for and Grant of Patent.

1.—(1.) An application for a patent may be made by any person who claims to be the true and first inventor of an invention whether he is a British subject or not, and whether alone or jointly with any other person.

(2.) The application must be made in the prescribed form, and must be left at, or sent by post to, the Patent Office in the prescribed manner.

(3.) The application must contain a declaration to the effect that the applicant is in possession of an invention, whereof he, or in the case of a joint application one at least of the applicants, claims to be the true and first inventor, and for which he desires to obtain a patent, and must be accompanied by either a provisional or complete specification.

(4.) The declaration required by this section may be either a statutory declaration or not, as may be prescribed.

2.—(1.) A provisional specification must describe the nature of the invention.

(2.) A complete specification must particularly describe and ascertain the nature of the invention and the manner in which the same is to be performed.

(3.) In the case of any provisional or complete specification where the comptroller deems it desirable, he may require that suitable drawings shall be supplied with the specification, or at any time before the acceptance of the same, and such drawings shall be deemed to form part of the said specification.

(4.) A specification, whether provisional or complete, must commence with the title, and in the case of a complete specification must end with a distinct statement of the invention claimed.

(5.) Where the invention in respect of which an application is made is a chemical invention, such typical samples and specimens as may be prescribed shall, if in any particular case the comptroller considers it desirable so to require, be furnished before the acceptance of the complete specification.

3.—(1.) The Comptroller General of Patents, Designs, and Trade Marks (hereinafter referred to as the comptroller) shall refer every application to an examiner.

(2.) If the examiner reports that the nature of the invention is not fairly described, or that the application, specification, or drawings have not been prepared in the prescribed manner, or that the title does not sufficiently indicate the subject-matter of the invention, the comptroller may refuse to accept the application or require that the application, specification, or drawings be amended before he proceeds with the application; and in the latter case the application shall, if the comptroller so directs, bear date as from the time when the requirement is complied with.

(3.) Where the comptroller refuses to accept an application or requires an amendment, the applicant may appeal from his decision to the law officer, who shall, if required, hear the applicant and the comptroller, and may make an order determining whether and subject to what conditions (if any) the application shall be accepted.

(4.) The comptroller shall, when an application has been accepted, give notice thereof to the applicant.

4.—Where an application for a patent in respect of an invention has been accepted, the invention may, during the period between the date of the application and the date of sealing such patent be used and published without prejudice to the patent to be granted for the invention; and such protection from the consequences of use and publication is in this Act referred to as provisional protection.

5.—(1.) If the applicant does not leave a complete specification with his application, he may leave it at any subsequent time within six months from the date of the application.

Provided that where an application is made for an extension of the time for leaving a complete specification, the comptroller shall, on payment of the prescribed fee, grant an extension of time to the extent applied for, but not exceeding one month.

(2.) Unless a complete specification is so left the application shall be deemed to be abandoned.

6.—(1.) Where a complete specification is left after a provisional specification, the comptroller shall refer both specifications to an examiner.

(2.) If the examiner reports that the complete specification has not been prepared in the prescribed manner, the comptroller may refuse to accept the complete specification until it has been amended to his satisfaction.

(3.) If the examiner reports that the invention particularly described in the complete specification is not substantially the same as that which is described in the provisional specification the comptroller may—

(*a*) refuse to accept the complete specification until it has been amended to his satisfaction; or

(*b*) (with the consent of the applicant) cancel the provisional specification and treat the application as having been made on the date at which the complete specification was left, and the application shall have effect as if made on that date.

Provided that where the complete specification includes an invention not included in the provisional specification, the comptroller may allow the original application to proceed so far as the invention included both in the provisional and in the complete specification is concerned, and treat the claim for the additional invention included in the complete specification as an application for that invention made on the date at which the complete specification was left.

(4.) A refusal of the comptroller to accept a complete specification shall be subject to appeal to the law officer, who shall, if required, hear the applicant and the comptroller, and may make an order determining whether and subject to what conditions (if any) the complete specification shall be accepted.

(5.) Unless a complete specification is accepted within twelve months from the date of the application, the application shall (except where an appeal has been lodged) become void.

Provided that where an application is made for an extension of time for the acceptance of a complete specification, the comptroller shall, on payment of the prescribed fee, grant an extension of time to the extent applied for, but not exceeding three months.

7.—(1.) Where an application for a patent has been made and a complete specification has been left, the examiner shall, in addition to the other inquiries which he is directed to make by this Act, make a further investigation for the purpose of ascertaining whether the invention claimed has been wholly or in part claimed or described in any specification (other than a provisional specification not followed by a complete specification) published before the date of the application, and left pursuant to any application for a patent made in the United Kingdom within fifty years next before the date of the application.

(2.) If on investigation it appears that the invention has been wholly or in part claimed or described in any such specification, the applicant shall be informed thereof, and the applicant may, within such time as may be prescribed, amend his specification, and the amended specification shall be investigated in like manner as the original specification.

(3.) If the comptroller is satisfied that no objection exists to the specification on the ground that the invention claimed

Digitized by Google

thereby has been wholly or in part claimed or described in a previous specification as before mentioned, he shall, in the absence of any other lawful ground of objection, accept the specification.

(4.) If the comptroller is not so satisfied, he shall, after hearing the applicant, and unless the objection is removed by amending the specification to the satisfaction of the comptroller, determine whether a reference to any, and, if so, what prior specifications ought to be made in the specification by way of notice to the public.

Provided that the comptroller, if satisfied that the invention claimed has been wholly and specifically claimed in any specification to which the investigation has extended, may, in lieu of requiring references to be made in the applicant's specification as aforesaid, refuse to grant a patent.

(5.) An appeal shall lie from the decision of the comptroller under this section to the law officer.

(6.) The investigations and reports required by this section shall not be held in any way to guarantee the validity of any patent, and no liability shall be incurred by the Board of Trade or any officer thereof by reason of, or in connection with, any such investigation or report, or any proceeding consequent thereon.

8.—(1.) An investigation under the last preceding section shall extend to specifications published after the date of the application in respect of which the investigation is made, and being specifications which have been deposited pursuant to prior applications; and that section shall, subject to rules under this Act, have effect accordingly.

(2.) Where, on such an extended investigation, it appears that the invention claimed in the specification deposited pursuant to an application is wholly or in part claimed in any published specification deposited pursuant to a prior application, the applicant shall, whether or not his specification has been accepted or a patent granted to him, be afforded such facilities as may be prescribed for amending his specification, and in the event of his failing to do so the comptroller shall, in accordance with such procedure as may be prescribed, determine what reference, if any, to other specifications ought to be made in his specification by way of notice to the public.

(3.) For the purposes of this section an application shall be deemed to be prior to another application if the patent applied for when granted would be of prior date to the patent granted pursuant to that other application.

(4.) This section shall come into operation at such date as the Board of Trade may by order direct, and shall apply only to applications made after that date, and the order shall be laid before both Houses of Parliament.

9.—On the acceptance of the complete specification the comptroller shall advertise the acceptance; and the application and specifications with the drawings (if any) shall be open to public inspection.

10.—After the acceptance of a complete specification and until the date of sealing a patent in respect thereof, or the expiration of the time for sealing, the applicant shall have the like privileges and rights as if a patent for the invention had been sealed on the date of the acceptance of the complete specification. Provided that an applicant shall not be entitled to institute any proceeding for infringement until a patent for the invention has been granted to him.

11.—(1.) Any person may at any time within two months from the date of the advertisement of the acceptance of a complete specification give notice at the Patent Office of opposition to the grant of the patent on any of the following grounds:—

(*a*) that the applicant obtained the invention from him, or from a person of whom he is the legal representative; or

(*b*) that the invention has been claimed in any complete specification for a British patent which is or will be of prior date to the patent the grant of which is opposed, other than a specification deposited pursuant to an application made more than fifty years before the date of the application for such last-mentioned patent; or

(*c*) that the nature of the invention or the manner in which it is to be performed is not sufficiently or fairly described and ascertained in the complete specification; or

(*d*) that the complete specification describes or claims an invention other than that described in the provisional specification, and that such other invention forms the subject of an application made by the opponent in the interval between the leaving of the provisional specification and the leaving of the complete specification, but on no other ground.

(2.) Where such notice is given the comptroller shall give notice of the opposition to the applicant, and shall, on the expiration of those two months, after hearing the applicant and the opponent, if desirous of being heard, decide on the case.

(3.) The decision of the comptroller shall be subject to appeal to the law officer, who shall, if required, hear the applicant and the opponent, if the opponent is, in his opinion, a person entitled to be heard in opposition to the grant of the patent, and shall decide the case; and the law officer may, if he thinks fit, obtain the assistance of an expert, who shall be paid such remuneration as the law officer with the consent of the Treasury may determine.

12.—(1.) If there is no opposition, or, in case of opposition, if the determination is in favour of the grant of a patent, a patent shall, on payment of the prescribed fee, be granted to the applicant, or in the case of a joint application to the applicants jointly, and the comptroller shall cause the patent to be sealed with the seal of the patent office.

(2.) A patent shall be sealed as soon as may be, and not after the expiration of fifteen months from the date of application, provided that—

(*a*) Where the comptroller has allowed an extension of the time within which a complete specification may be left or accepted, a further extension of four months after the said fifteen months shall be allowed for the sealing of the patent:

(*b*) Where the sealing is delayed by an appeal to the law officer, or by opposition to the grant of the patent, the patent may be sealed at such time as the law officer may direct:

(*c*) Where the patent is granted to the legal representative of an applicant who has died before the expiration of the time which would otherwise be allowed for sealing the patent, the patent may be sealed at any time within twelve months after the date of his death:

(*d*) Where in consequence of the neglect or failure of the applicant to pay any fee a patent cannot be sealed within the period allowed by this section, that period may, on payment of the prescribed fee and on compliance with the prescribed conditions, be extended to such an extent as may be prescribed, and this provision shall, in such cases as may be prescribed and subject to the prescribed conditions, apply where the period allowed for the sealing of the patent has expired before the commencement of this Act.

13. Except as otherwise expressly provided by this Act, a patent shall be dated and sealed as of the date of the application: Provided that no proceedings shall be taken in respect of an infringement committed before the publication of the complete specification.

14.—(1.) A patent sealed with the seal of the Patent Office shall have the same effect as if it were sealed with the Great Seal of the United Kingdom, and shall have effect throughout the United Kingdom and the Isle of Man.

Provided that a patentee may assign his patent for any place in or part of the United Kingdom, or Isle of Man, as effectually as if the patent were originally granted to extend to that place or part only.

(2.) Every patent may be in the prescribed form and shall be granted for one invention only, but the specification may contain more than one claim; and it shall not be competent for any person in an action or other proceeding to take any objection to a patent on the ground that it has been granted for more than one invention.

15.—(1.) A patent granted to the true and first inventor shall not be invalidated by an application in fraud of him, or by provisional protection obtained thereon, or by any use or publication of the invention subsequent to that fraudulent application during the period of provisional protection.

(2.) Where a patent has been revoked on the ground of fraud, the comptroller may, on the application of the true inventor made in accordance with the provisions of this Act, grant to him a patent in lieu of and bearing the same date as the patent so revoked:

Provided that no action shall be brought for any infringement of the patent so granted committed before the actual date when such patent was granted.

16.—(1.) Where the same applicant has put in two or more provisional specifications for inventions which are cognate or modifications one of the other, and has obtained thereby con-

Digitized by Google

current provisional protection for the same, and the comptroller is of opinion that the whole of such inventions are such as to constitute a single invention and may properly be included in one patent, he may accept one complete specification in respect of the whole of such applications and grant a single patent thereon.

(2.) Such patent shall bear the date of the earliest of such applications, but in considering the validity of the same and for the purpose of the provisions of this Act with respect to oppositions to the grant of patents, the court or the comptroller, as the case may be, shall have regard to the respective dates of the provisional specifications relating to the several matters claimed therein.

(To be continued.)

Reports of Companies.

EUROPEAN PETROLEUM COMPANY, LTD.

The report for the year 1907 states that the profits for the year have amounted to £75,438.; interest on debentures, etc., absorbed £43,185., leaving £32,253. The leases of two properties at Baku expired, one of which has been renewed, whilst the lease of another plot has been acquired. The Hora concession, on the shore of the Sea of Marmora, has been finally abandoned, as oil was not found in paying quantities. The board propose that a sum of £70,000. should be added to the depreciation and renewal reserve, and after this provision has been made there will be a debit balance on the twelve months of £37,746. 18s. 3d. The net production of crude oil from the properties at Baku during the twelve months has amounted to 5,412,062 poods. As compared with the previous year, these figures show a small increase of 71,531 poods, but as compared with the twelve months ended May 13, 1905, the decrease amounts to 4,830,826 poods. During the year under review, the disturbed conditions at Baku unfortunately continued, and for ten weeks all work was entirely suspended, with consequent serious, and in some cases, permanent injury to the wells. Since the close of the financial year the position has somewhat improved, and the production has shown a slight increase. The price of crude oil has been satisfactory, the prices realised having fluctuated between 22 and 30 copecks during the year under review. Towards the close of the financial year there was a distinct rise in freights, and all the company's steamers are now fully employed at profitable rates.

A. AND F. PEARS LTD.

The report for the year ended June 30 states that, after carrying £4,702. to depreciation fund, the net profit was £67,325.; this, with £2,089. brought forward from the previous account, makes £69,414. Deducting £26,400., the amount of the debenture interest and interim dividends on preference and ordinary shares, a balance of £43,014. remains, from which the directors propose payment of dividends for the half-year ended June 30 as follows: At the rate of 6% on the cumulative preference shares, £6,000.; at the rate of 12% per annum on the ordinary shares (making 10% for the year), £15,600.; at the rate of 10% per annum on the deferred ordinary shares outstanding on June 30, £15,000; the balance, £6,414., is to be carried forward.

THE SILVER FIELDS OF COBALT.

THE silver deposits of Cobalt, in Northern Ontario, Canada, which have recently attracted a good deal of attention, have been investigated by a special correspondent of the *Investors' Guardian*. According to his report, the richness of the ore is beyond question, and shafts, sunk beyond the conglomerate area, prove that the deposits continue in character and value. In one case the vein goes down vertically, and assays 1,450 ozs. silver, 4% cobalt, and 2% nickel to the ton. From this and from an underhand stope, 40 ft. deep (alongside the shaft) some 125 tons of first-class ore has already been shipped realising $110,000., thus affording proof that the silver-cobalt ores are not confined to the conglomerate formation surrounding the Cobalt Lake.

This silver-bearing area lies in a line of country some 40 miles long as the crow flies, and permeates three different formations; it seems, therefore, very improbable that these veins will die out at any shallow depth. The La Rose mine at Cobalt Lake proves this in a most unmistakable manner. Its main shaft is now down 300 ft., with levels at 90, 190, and 300 ft., on a rich vein varying from six inches to 30 inches in width. The mine has already shipped over $1,500,000. worth of silver ore, all of which has been derived from the work of developing the mine only. The value of the ore developed and blocked out in readiness for mining proper is enormous, and is stated to be not far short of $20,000,000.

One of the remarkable features of the mining around Cobalt Lake is that the cost of the erection of mining plant has been paid for by ore gained in the process of development. The report states that there can be no doubt as to the future prosperity and development of the mines in this district. The correspondent concludes:—This Northern Ontario camp will be the greatest silver-mining camp that has ever existed. Further, these mines cannot fail to be a factor of great importance to the increase of Canada's revenue and population.

TRADE OF SMYRNA IN 1906.

IN his report on the trade of Smyrna, 1906, Mr. B. A. Altintop, of the British Consulate-General, states that during the year 1906 high prices were obtained in Smyrna for most products. The same cannot, however, be said of dealers and shippers. The risky venture of forward sales compelled them, in order to meet their engagements, to purchase at prices considerably higher than those they had contracted to deliver at; this has led to several failures in which some British houses were involved.

After a somewhat chequered career full of incidents, the new tariff, increasing the customs import duty from 8 to 11%, *ad valorem*, definitely came into force on July 12, 1907, the collateral reforms, on the introduction and loyal observance of which the acceptance of the new tariff by the Powers was made conditional, having been formally decreed. In the meantime, the following improvements in the customs service have taken place in the last 12 months:—(1) A slight reduction in the tariff of porterage dues; a substantial increase of the staff. (2) A more rational application of the "ardiyeh" (storage) charges. (3) Some abridgment or simplification of formalities. (4) Facilities are given for commercial travellers' goods which have been assimilated to goods in transit. All goods entering Turkey may claim this treatment within six months of their importation, subject to the observance of certain formalities for purposes of identification and control.

According to the report from the British Consulate-General, Two factories for dyeing yarns have been started. Both are British, though the machinery is German, and German workmen are employed for the technical work.

Two factories for extracting oil by chemical process from crushed olive stones have been started. This oil is used in the manufacture of soap.

Noticing that most of the dyes and colouring substances used in the carpet industry were imported from Germany, the Consulate-General of Smyrna consulted the head of one of the most important local British manufacturers of carpets for an explanation of it. He stated, and his statement has since been confirmed by another British manufacturer of Smyrna carpets, that of the dyes used in the carpet industry two-thirds are German and one-third French. They are both better and cheaper than similar British products. "The German manufacturers either visit the district personally or send their agents, who penetrate into the chief centres of the interior where carpets are manufactured, show their dyes to our men and teach them how to employ them. I never saw a British manufacturer or his travelling agent here in Smyrna. We know that the best dyes are German. I myself are using them, and find them excellent. As for the samples and patterns in a book published by a dye manufacturing firm in the United Kingdom and sent to a carpet manufacturer, he affirmed that most of the dyes of which samples were given were German dyes imported into the United Kingdom. The same authority gave also the names of two German manufacturers who had personally visited Smyrna and the carpet industry centres in the interior, and had established solid business connections. A certain amount of native colouring substances, such as valonea, yellow berries, madder root, etc., have also to be used in subdueing colours, etc. Indigo (natural), until a few years ago, used to be imported exclusively from India, but

Digitized by Google

within the last few years German synthetic indigo has been replacing the natural article.

Exports of Chemicals and Drysalteries.

The following were the chief exports from Smyrna during 1906–05 :—

	Tons, 1906	Tons, 1905.
Antimony	1,036	188
Beeswax	165	173

MITYLENE.

Olive Oil—A good trade was done in olive oil during 1906 for local consumption by soapmakers; the oil was of fair quality and the principal outside customers were again Turkey, Bulgaria and Roumania. The average price for current quality was from £30. 15s. to £31. 15s. a ton; extra fine qualities for table use kept very high, £48. a ton being paid for small quantities. The yield of oil from the crop maturing at the end of 1905, estimated then at 12,700 tons, turned out actually 16,800 tons, valued at £392,000.; the crop maturing at the end of this year is estimated to yield 13,400 tons of oil.

Soap.—In the soap trade the following exports have taken place during the last three years from the port of Mitylene :—1904, 60,000 bags (of 1½ cwt. apiece); 1905, 50,000 bags; 1906, 55,000 bags. The export from the whole island was 150,000 bags, or 220,000 cwts. Bulgaria was a large buyer of Mitylene soap in 1906.

Valonea.—The crop of valonea in 1906 amounted to 2,000 tons, of better quality than in 1905; prices averaged £8. f.o.b., for unpicked. The exports of this article amounted to 450 tons.

SCIO.

Very little direct trade is done with Europe. The merchants of Scio generally buy their goods from Smyrna, Constantinople, or the Piræus, on account of the long credit and other facilities obtainable there. German and Austro-Hungarian articles, though of inferior quality, are preferred by local merchants to British goods on account of their cheapness. The chief articles of export are :—Gum mastic, to Austria-Hungary, Egypt, France, £10,000.; olives and olive oil, £39,500.

THE REVENUE RETURNS.—The exchequer returns from April 1 to October 19 show :—Receipts £71,911,254., as compared with £71,869,847. in the corresponding period last year. The expenditure was £76,530,354., against £77,713,392.; and the balances £2,916,089., against £3,989,087.

Continental Notes.

IN the *Chemiker-Zeitung* for October 5, H. Kreis writes on the examination of brandies. In order to ascertain whether these beverages have been adulterated many authorities recommend tasting by an expert, but there is great difficulty in finding a man who can give a really reliable opinion upon any sample that is presented to him. As regards chemical tests, the determinations of the extract, furfurol, and aldehyde, although they may give results of some interest, do not yield data from which a definite opinion can be formed. The only constituent that in genuine brandies only varies within narrow limits is the fusel oil, or higher alcohols. For this purpose the author recommends a method which is a modification of the one that was proposed some years ago by Komarowsky. A sufficient quantity of the brandy is heated for half an hour under an inverted condenser, in 40% aqueous solution with 5% caustic soda, and is then distilled down to a small bulk. If the brandy contains fruit extract, however, there must be a preliminary distillation to eliminate this constituent. The distillate from the soda distillation is made up to exactly 30% by volume, and the higher alcohols are estimated colorimetrically. For this purpose 5 cc. are placed in a stoppered cylinder, with 0.5 cc. of a freshly prepared 1% alcoholic solution of salicylic aldehyde, and 10 cc. of concentrated sulphuric acid are added. The cylinder is then shaken and allowed to cool. The colour is compared with that given by a sample or samples containing a known amount of higher alcohols.

In the same issue Dr. Anton Seyda continues his observations upon chemical cleaning. The articles of clothing are sorted according to the nature of the material, scrubbed with dilute solution of saponin, and then treated again in the washing machine, where they are then rinsed with the solvent until it runs away clear. The solvent is afterwards recovered by distilling it with steam and allowing it to settle out from the water. The articles are then wrung out in a centrifugal machine and dried, either in special stoves, or preferably in the open air. The benzine is best kept in iron reservoirs, the space above the liquid being filled with carbon dioxide. Specially delicate articles, such as lace, must be treated with special care. It is only in exceptional cases that this treatment with saponin and benzine is sufficient to cleanse the articles adequately; generally there are spots that have to be dealt with by other means. Substances that are insoluble in benzine can often be removed with distilled water, but care must be exercised that in removing these spots the dye is not affected so as to make a stain. In the case of a mark made by spilling sugar solution on a dark blue silk dress, a satisfactory result was achieved by treating with a mixture of acetic acid and water specially suited to the material. Chemical cleaning is most useful for silk and woollen goods, but not so much as for cotton; it readily removes dirt that is on the surface, does not attack so well foreign matter that has been absorbed into the fibres. Rust marks are removed by boiling in a sulphuric-acid bath, in a copper vessel in which there is also a piece of zinc wrapped up in linen. The author also recommends for this purpose a 10% acetic acid solution saturated with oxalic acid. Where other methods fail it is necessary to have recourse to bleaching, and for this purpose potassium permanganate is generally used. For subsequently dissolving out the precipitated manganese dioxide use is made of sulphurous or hydrosulphurous acid, or hydrogen peroxide. The author closes his paper with some remarks on the importance of chemical cleaning from the point of view of hygiene and economy.

To the issue of October 9 Dr. C. R. Böhm contributes the second portion of his paper on the conductivity of certain carbides and the early stages of the metal filament lamps. In this he gives an account of the work that has been published by various workers on lamps made from the carbides of zirconium, boron, titanium, and other metals.

In the same number Dr. F. Erban and Dr. A. Mebus publish some studies on the neutralisation of acid diazo-solutions.

Crystallised platinum forms the subject of a communication by Dr. Fr. Limmer to the issue of October 12. It has been observed by different chemists that under certain conditions platinum compounds, when heated, leave residues of platinum in the form of small shining octahedra. From his investigations, Limmer has come to the conclusion that finely divided platinum, when heated by itself for a prolonged period, has the tendency to become crystalline. Certain of the chlorine compounds of platinum, however, show a very marked tendency to yield

Digitized by Google

crystals of the metal when heated, although this is not the case with platinum chloride or the platinochlorides of hydrogen and ammonium, but this may be due to the fact that these compounds decompose very rapidly.

In the same number O. Vogel writes on the history of wood distillation, and gives some details of a very early plant for this purpose that was already in operation in 1825 at a silver smelting works at Freiberg. The appliances were of course very primitive as compared with those now in use.

Our Book Shelf.

Glues and Gelatines: A Practical Treatice on the Methods of Testing and Use. By R. Livingstone-Fernbach. Pp. 208. London: Archibald Constable and Co., Ltd. 10s. 6d. net.

In the work under review the author has attempted to provide a practical treatise on the testing and examination of glue and gelatine; he has also endeavoured to acquaint the consumer with the methods employed by representative American manufacturers in grading and distinguishing between glues, and with the considerations governing their valuation. In his preface the author points out that although the subject of glue is by no means unrepresented in technical literature, it has been dealt with chiefly from the standpoint of manufacture; while the intelligent testing of glue has been given scant consideration. He observes that although fifty million pounds weight of glue are consumed annually in the United States, he considers it safe to assert that 80% of the users of this substance have only the vaguest conception of its properties, and are guided largely by the manufacturer or dealer in the selection of their supply. In the main their confidence is not abused, but in many instances they are the victims of unscrupulous salesmen, and it is to afford the uninitiated consumer a rational means of protection that the present work has been designed.

The first chapter deals with the nature, properties and sources of glue, and with the principles of manufacture. The classification and testing of glues is dealt with in Chapter II. Chapter III. deals with the analysis of glues and gelatines; Chapter IV. with glue and gelatine substitutes; Chapter V., foreign glues; and Chapter VI. the selection of glues for various industries. Chapter VII. describes how glue should be used, while in Chapter VIII. the commercial and legal aspects of the trade are considered. Chapter IX. comprises a collection of manufacturing recipes, and analytical methods are described in Chapter X. An appendix of 20 pages completes a very useful volume which should be in the hands of all glue consumers.

The Bacteriological Examination of Disinfectants. By W. Partridge, F.I.C. With a preface by Major C. E. P. Fowler, D.Ph., F.R.C.S. Pp. 66. London: The Sanitary Publishing Co., Ltd. 1907. 2s. 6d., net.

In our last Special Issue we described at some length the Rideal-Walker method for the standardisation of disinfectants—a subject which for some time has been attracting attention. In the book before us the author's object has been to deal with the various methods at the disposal of the analyst and bacteriologist in ascertaining the relative values of disinfectants. Mr. Partridge favours the employment of the Rideal-Walker process, which, as we pointed out in the article already referred to, is being adopted very extensively for the purpose of standardisation, and a considerable portion of the little volume is devoted to this method. Incidentally the author explains some of the causes of discrepancies in results obtained by different workers by the Rideal-Walker method. A very full and detailed description of the method of operation is given, and we have no doubt that this will do much to remove the apparent difficulty of the process. Chapters dealing with the influence of organic matter on disinfectants and on their properties and selection are included, while a preface by Major Fowler, R.A.M.C., deals with the present position of the movement towards standardisation.

"Concrete and Constructional Engineering." Sepember.

The September number of *Concrete and Constructional Engineering* contains the revised British standard specification for Portland cement—a specification which is of great importance to all cement manufacturers. There are also articles on reinforced concrete wharves and quays, the laws of proportioning concrete, and concrete-mixing machines, together with descriptions and illustrations of the latest applications of reinforced concrete. An editorial note deals with the packing of Portland cement, and it is pointed out that in the revised British standard specification and also in the report of the Reinforced Concrete Committee it is required that cement shall be delivered in packages marked with the manufacturer's name. The importance of this provision requires no additional emphasis.

Metric Weights with English Equivalents. By M. P. McCartney. Pp. 83. London: E. and F. N. Spon, Ltd. New York: Spon and Chamberlain. 1s.

This little book will be found useful for all purposes where the reduction of metric weights is required. The tables have been arranged on the basis of 1 gramme = 15.432 grains, and one kilogramme = 2·2046 lbs., and all calculations have been carried to the fourth decimal place. An additional table gives the values in troy weight, and the avoirdupois weights have been extended to the nearest quarter of 1 lb. minus. The tables are intended for commercial purposes, and will be found extremely useful.

Metropolitan Borough of Poplar: Annual Report for the Year 1906. By F. W. Alexander, Medical Officer of Health. London: G. Morrish. Pp. 223.

The annual report of the Medical Officer for the Metropolitan Borough of Poplar contains the usual statistical and other information to be found in such reports, but a very uncommon feature, to which we would call attention, will be found on pages 70-76. The Poplar authorities have in operation a plant for the electrolytic manufacture of disinfectant, and the present report contains a statement respecting the working of the plant. In an early issue we hope to refer at greater length to this interesting experiment.

E. Merck's Annual Reports: Vol. 20, 1906. Pp. 264. Darmstadt and London.

We have already expressed in these columns our appreciation of the high quality of the annual review of new therapeutic preparations which is issued from Merck's well-known laboratory at Darmstadt. The volume, which comprises no less than 264 pages of literary matter, is of great value to all interested in pharmacology and therapeutics, and will be sent free to any of our readers who care to apply for a copy to the firm's London house, 16, Jewry-street, E.C.

Cotton Finishing. By the Editors of the *Dyer and Calico Printer*. Pp. 185. London: Heywood and Co., Ltd.

The Glasgow and West of Scotland Technical College Calendar, 1907.

Aluminium and Platinum Movements in Russia.—In a review of the metal trade, the *Torg. Prom. Gazeta* observes that the importation of aluminium into Russia fell to 7,000 poods in the first half of this year, against 24,000 poods in the corresponding period of 1906. The tendency on the part of platinum, according to advices from the Urals, says the same authority, is distinctly downward. The exportation of this metal, according to Customs returns, has fallen from the level of 156 poods in 1906 (the first six months) to 90 poods in the first six months of this year.

The Faraday Society.—An ordinary meeting will be held on Tuesday, October 29, at 8 p.m., in the Library of the Institution of Electrical Engineers, 92, Victoria-street, S.W. The following papers will be read:—"On the Electrolysis of Salt Solutions in Liquefied Sulphur Dioxide at Low Temperatures," by Bettram D. Steele, D.Sc. "Note on the Action of Aluminium Powder on Silica and Boric Anhydride," by Frank E. Weston, B.Sc., and H. Russell Ellis, B.Sc. "Reduction of Metallic Oxides by Means of Calcium Hydride," by F. Mollwo Perkin, Ph.D., and Lionel Pratt. Mr. N. T. M. Wilsmore, M.Sc., will exhibit a series-parallel lamp resistance useful for electro-chemical work. The Secretary will be glad to receive contributions to the discussion from those unable to be present at the meeting.

Analytical Notes.

ON THE COMPRESSION OF GASES BY MEANS OF HYDRAULIC APPARATUS.

By J. E. Petavel, M.Sc., F.R.S.

[*A paper read before the Manchester Literary and Philosophical Society. Reprinted by permission of the Society from the "Manchester Memoirs."*]

I.—*On the Compression of Small Quantities of Pure Gas.*

In the course of experimental work it is occasionally desirable to compress small quantities of very pure gases. For this purpose the ordinary gas compressor is unsatisfactory. Not only is it difficult to obtain a compressor which will deal with less than a thousand litres at a time, but there always is a serious risk of contamination by a slight inleak of air, by admixture with the previous contents of the pipes and cylinders, and by the vapours given off by the heated leathers and stuffing boxes. A brief description of an apparatus for compressing a few litres of a pure or rare gas to a high pressure may therefore be of some interest.

The general scheme will be easily understood by reference to the illustration.

"*A*" is a glass bell jar of one or two litres capacity which is connected to the generating apparatus through the stopcock *a*, and to the compressing plant through the valve *b*. The liquid used in this gasometer is glycerine, which has a low absorbing power for most gases.

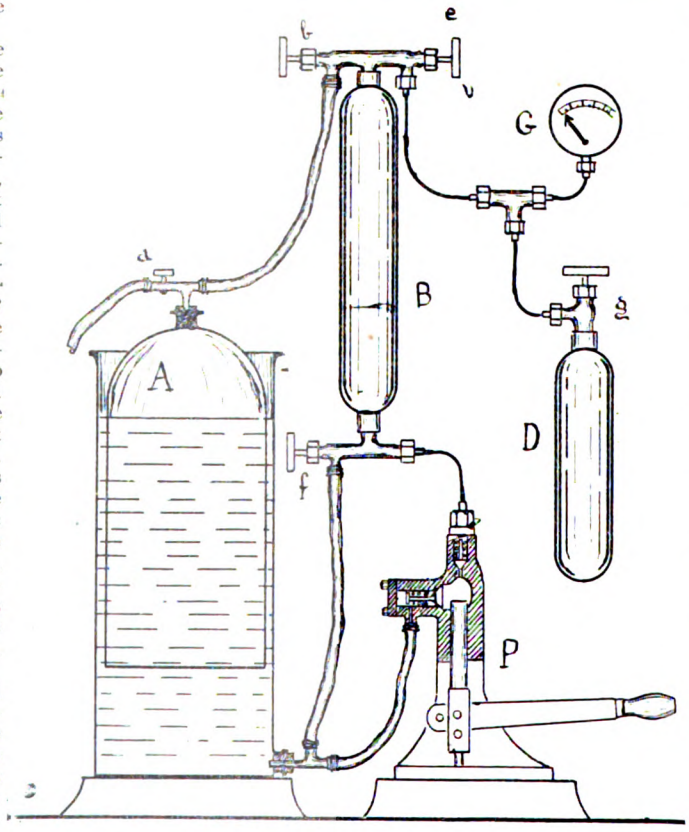
The compression cylinder *B* is of steel of about half a litre capacity. Its upper end is connected, as mentioned above, to the bell of the gasometer and also to the gauge *G* and storage cylinder *D*, the latter outlet being closed by the valve *e*. The lower extremity of this cylinder communicates on the one side with the hydraulic pump *P*, on the other with the gasometer through the valve *f*.

As compared with the ordinary compression plant,* this apparatus has the advantage of simplicity, complete safety, and relatively low cost.

For the gasometer an inverted glass bell jar will be found convenient. It is connected to the compression cylinder and pump by rubber tubes. No motive power is required, and almost any form of hand-worked hydraulic pump can be used. The compression cylinder and storage cylinders are of weldless mild steel ¼ or ½ inch thick according to the working pressure required, and can be obtained from the manufacturers who supply the commercial gas cylinders. The high-pressure valves and cone couplings are of the type previously described.† For connecting the various parts of the apparatus, flexible copper tubing of about ⅛in. external diameter and $\frac{1}{16}$ in. bore is employed.

With regard to the method of operating, a few words will suffice. The gas coming slowly from the generating apparatus passes through such purifiers as may be necessary, and accumulates in the gasometer. From time to time it is compressed into the storage cylinder in the following way:—

The valves *b* and *f* are first opened, allowing the gas to displace the glycerine contained in the compressing cylinder; they are then closed again and the valve *e* opened. The pump is now worked, forcing in the glycerine and compressing the gas. When the gauge indicates a pressure equal to that of the storage cylinder, the valve *g* is opened and the gas allowed to enter.



To avoid forcing over any liquid, the level reached by the glycerine in the gasometer when the cylinder *B* is full has been previously noted. The quantity of gas remaining in the compression cylinder can also be estimated by temporarily closing the valve *g* and noting the difference of pressure produced by a single stroke of the pump.

The system described above is convenient for dealing with gases which can only be generated at a slow rate—say, ten litres or less per hour—and pressures of 3,000 lbs. per square inch can easily be obtained with an ordinary hand pump.

II.—*Compression of Gases to very High Pressures.*

The maximum pressure for which the ordinary type of two or three-stage gas-compressor can be successfully built is about three or four thousand pounds per square inch. Above this limit, difficulties connected with the reduction of the clearance spaces, the efficient packing of the glands, pistons, etc., and the satisfactory cooling of the working parts become serious and are not easily overcome.

These troubles can be obviated by the use of hydraulic compression which has been successfully used by the author to compress gases up to ten or twelve thousand pounds per square inch.

In principle the system differs but little from the one referred to above, but the apparatus is, of course, of considerably greater strength.

When working at these high pressures, it is convenient to eliminate the generating plant and gasometer, and to fill the receiver *B* with gas previously compressed and stored. The quantity of gas dealt with at each operation may thus be increased a hundredfold or more, and the amount of labour involved correspondingly reduced.

Where exceptional purity is of no great importance, the compressed gas for this purpose may be obtained commercially.

For all ordinary work a hand pump will be found sufficient, and the contents of the receiver being compressed at a slow and uniform rate, no special provision is necessary for cooling the gas.

With regard to the question of safety, it is hardly necessary to point out the importance of securing the best materials and workmanship. Before use the apparatus should be carefully inspected and also tested hydraulically to double the working pressure.

* See R. S. Hutton and J. E. Petavel. *Jour. Soc. Chem. Ind.*, 1904, vol. 23 pp. 87-93.

† J. E. Petavel, *Phil. Trans.*, vol. 205, pp. 357-398.

Aluminium in 1906.—The Metal and Metallurgical Company, of Frankfurt, publish the aluminium statistics for 1906. The quantity smelted last year was 14,500 metric tons, against 11,500 metric tons in 1905, and 9,300 metric tons in 1904. In 1906 the leading producer was the United States—6,000 metric tons; France 4,000 metric tons, Germany, Austria-Hungary, and Switzerland 3,500 tons, and Great Britain 1,000 tons. These figures are only estimates. The whole world's production is in the hands of five concerns, which will not publish exact details of their operations. Nor are the figures respecting the consumption of aluminium more reliable, but the consumption per country during the last three years is given about as follows: United States of America, 5,900 tons in 1906, 4,300 tons in 1905, and 3,900 tons in 1904. France, 2,560 tons, 2,100 tons, and 1,100 tons. Russia, 800 tons, 1,100 tons, and 800 tons. Germany 2,700 tons, 2,100 tons, and 2,000 tons, and Great Britain 1,000 tons, 1,000 tons, and 700 tons, always for the years 1906, 1905, and 1904 in the order given respectively.

Indian Notes.

THIRTY-ONE distinct species of scale insects attack tea plants in India and Ceylon, and remedies are sought.

In several of the Native States there has lately been a considerable expansion in the manganese industry, notably in Mysore, Thabua, and Sandur, and important concessions are being granted.

In Burma, at present, oil is brought down in iron oil-flats from the oilfields at Yenongyoung, Singie and Yenangyat on the Irrawaddy, to storage tanks in Rangoon. The practice will probably be discontinued in the next two years, as a pipe line of about 300 miles, from the oilfields to Rangoon, will be laid down.

Special inquiries are being made regarding new oil seeds, as owing to the introduction of methods depending on the use of solvents for the extraction of oils, it is now possible to use commercially many materials of this class which were formerly unsaleable as oil-yielding products, such as soy beans and oil cakes prepared by native methods, etc.

Schemes have been completed for the establishment of Central Research Stations and Agricultural Colleges at Poona, Lyallpur, Cawnpore, Nagpur, Bhagalpur, Coimbatore, and Mandalay; and a staff of three European specialists has been sanctioned at each. Agricultural Stations for scientific research are also to be started at Aligarh, Partabgarh, Jullundur, Bassein, and Bankipur.

The damage done to Indian wheat by the weevil is greater than usually supposed. Recent experiments with 50 weevils set free in 100 grammes of hard wheat in a glass bottle show that in three months the insects had multiplied themselves sixty times, or a yield of 3,056 weevils, and one-quarter of the wheat was destroyed in the period. In commercial practice the loss would be greater, and would probably average 20%. Remedies are sought.

The rat rampaign continues with unabated vigour, and poisoned baits account for hundreds of thousands of rats monthly. The baits are laid by "municipal rat gangs." In spite of the heavy slaughter, the numbers do not seem to decrease. It is necessary to get rid of the rat, or the rat-flea or both, before the advent of the plague. It is too late when once the epidemic has begun. The life of the plague germ is in the soil, floors, and walls of houses, and the life is of short duration.

The Quinologist to the Government of India, in explaining the loss on the pice (*i.e.*, one-twelfth of an anna, or one-twelfth of a penny) packets of quinine this year, attributes it to the small yield of quinine sulphate in the bark, which was only 2.68%. The importation of quinine, which has been coloured pink, has been prohibited in British India, so as not to be a colourable imitation of the Government quinine which is coloured pink, and is well known to every native who buys the drug in pice packets.

At the end of each year many of the Indian railway companies place their yearly contracts for the following year, for chemicals, disinfectants, wood preservatives, &c., &c. Among the railways may be mentioned the North Western Railway at Lahore, the Nizams Guaranteed State Railway at Secunderabad, Madras Railway at Royapuram, Kalka Simla Railway at Simla, Great Indian Peninsula Railway at Parel, East Indian (Calcutta), Eastern Bengal (Sealdah), Burma Railways Co. (Rangoon), Bombay Barada and Central India (Parel), Bengal Nagpur (Nagpur), Assam Railways and Trading Company (Dibrugarh), Assam Bengal (Pahartali), Oudh and Rohilcund (Lucknow), Rohilcund-Kumaon (Bareilly), South Indian (Negapatam), Southern Mahratta (Hubli), Rajputana Malwa (Ajmere), Ceylon Government Railways (Colombo), Bengal and North Western (Gorakhpur), etc. Price lists should be addressed to "The Chief Storekeeper."

LABOUR TROUBLE IN THE LIME TRADE.—A large number of men employed in the Peak District lime quarries are out on strike. The men demand an increase in wages and other concessions, which the lime firms refuse to concede.

EMMOTLAND CHEMICAL WORKS CO., LTD.—Registration has been made of a debenture dated August 23, 1907, to secure £1,300., charged on the Company's undertaking and property, present and future, including uncalled capital.

Selected Correspondence.

THE PROPOSED TECHNICAL LIBRARY IN MANCHESTER.

(*To the Editor of the Manchester Guardian.*)

Sir,—The proposal of the Manchester Chamber of Commerce as by deputation submitted to the Manchester Libraries Committee, for the provision of an adequate library for the technical requirements of the Manchester district must have come to your readers as a just and complementary arrangement with our sustained efforts in educational matters. As chairman of the Education Committee of the Lancashire County Council, whilst urging the importance of education *per se*, I have again and again drawn attention to the "wastage" in several directions, notably in the early leaving age at our secondary schools, to the detriment of the higher schools, whereby the real intention underlying our efforts—the due equipment of our "scholars" for the real work of life—is minimised. To prevent further wastage we have the proposal of the Chamber of Commerce to ensure to those who have enjoyed the beneficial training of our schools and universities the necessary information derivable from the current technical and scientific journals, which will enable them to utilise their knowledge and be kept in touch with the work of this and other countries, to their own advantage and the advantage of our country. We spend our money willingly in equipping our students for their after-career; let us not begrudge them the provision of material for such subsequent work.

It is for these reasons that I join with my colleagues of the Chamber of Commerce in urging upon the Manchester Libraries Committee the acceptance of our request, which I hope may result in the establishment of a technical library fully equipped with literature worthy of the traditions of "greater Manchester."

Yours, &c.,

Dalegarth, Chorley, Lancashire, October 16. HY. F. HIBBERT.

Answers to Correspondents.

We cannot undertake to reply to correspondents through the post. Those of our readers who have addressed queries to us should look in this column for a reply.

H. W.—Thanks for corrected proof. The article appears this week.

D. B.—We shall be pleased to receive the article, with drawings and photo.

G. W. E.—We are forwarding another copy of our last issue, and you will receive the full number in future.

W. J.—Your letter of the 22nd respecting cyanide in Russia has our attention. Thanks for the further information.

A. P. H.—We are greatly obliged by your courtesy. You will notice that the paper appears in this issue with full acknowledgments.

J. J. G. AND SONS, LTD.—Thanks for block, which came duly to hand. The article will appear next week. We have had to hold it over from this issue.

D. B. AND CO.—Our reply to your query of the 15th inst. crossed yours of the 22nd in the post. We have taken the matter up with the Customs authorities.

G. C. CO., LTD.—We regret that we are unable to supply the desired information respecting tri-phosphate of soda. We can only suggest that you should trace the firms mentioned in the "Chemical Trade Directory."

SNEJUI CONSOLIDATED MINES LTD.—Capital. £100,000, in £1. shares. This company has been formed to prospect for, wor. and develop gold, lead, tin, wolfram, silver, copper, coal, iron and other mines, etc. No initial public issue. The first directors are to be appointed by the subscribers. Qualification, 100 shares.

NORTH HUMMOCK (SELANGOR) RUBBER COLTD.—Capital. £100,000, in £1. shares. This company has been formed to acquire, cultivate and exploit certain lands intended to be called the North Hummock Estate, belonging to the Bukit Rajah Rubber Co., Ltd., in the district of Klang, Selangor. Minimum cash subscription, 35,000 shares. First directors (not less than three nor more than six) are G. A. Talbot, H. K. Rutherford, N. W. Grieve, and A. W. Crichton. Registered office, 20, Eastcheap, E.C.

THE DEODORISATION OF FISH OILS.

By Josef Hankam (communicated by H. Wiskemann).

(*Continued from p. 350.*)

THE use of chemical agents proved to be not quite so unfavourable, but still not permanently successful. Chloride of lime decreases the smell, but the effect is so slight that this agent is practically out of the question for general use. In the process of partial saponification of the fish-oil by means of caustic alkalies (more especially potash lye) there are certainly precipitated various albuminous and glue-like substances, but even here a lasting elimination of the smell is not attained. Moreover, the separation of the soaps formed from the fish-oil fat is a complicated operation and is not quantitatively feasible—a fact which has been repeatedly proved by my experiments on a fairly large scale. By splitting up the resulting soaps by means of acids, the fatty acids of the fish-oils are liberated, but with them there reappear the albuminous substances already mentioned, together with the objectionable smell.

The results secured by the use of hydrate of lime are likewise of no practical importance. By the action of this agent there are saponified only the free fatty acids. The substances causing the smell are not affected, and the formation of persistent emulsions considerably increases the difficulties of the operation. Moreover, the rational working of this method (which promises only scanty results) requires a complicated plant.

Treatment with concentrated sulphuric acid alone has not proved satisfactory as regards the elimination of the smell from fish oils and fish fats. The largest portion of the gluey and albuminous substances is, indeed, precipitated in the form of a tar-like mass, and a portion of the smelling substances is eliminated, but I did not succeed in thus eradicating the smell in a satisfactory manner.*

Boiling the oils with diluted acid aims only at freeing them from inorganic ingredients, and eliminating any emulsions that might form. Of chemical agents only alum and tannic acid are still of interest, but, used by themselves, they only produce results of slight importance† as regards deodorisation.

Mention may be made here of Gregor Sandberg's (Moscow)‡ method for the production of an odourless mixture of fatty acids from fish-oils and fish-fats. The bad-smelling products of decomposition of the albuminous substances and of the amines $NH_2(CH_3)$, $NH(CH_3)_2$, and $N(CH_3)_3$ are eliminated by transforming the latter into salts, soluble in water, and then by washing. According to this method the respective fish-oils and fish-fats are by any of the known processes of saponification—for instance, in the autoclave—split up by sulphuric acid, and the resulting still odorous fatty acids are subject to after-treatment. In such after-treatment the quantitative proportion and the temperature are of importance. The fatty acids, which still retain their smell, are, while being constantly stirred, and kept at a temperature of not less than 25° C., mixed with 20% or more of sulphuric acid of a specific gravity of 1.84. The temperature rises, but must be kept between 25 and 40° C., so that no fat is affected. After a few hours the reaction is finished, and there have formed soluble sulphates which can be eliminated by washing. According to this method the washed and subsequently dried fatty acids are distilled in suitable apparatus.

As regards this method of treating fish-oils and fish-fats, I would say (on the strength of my observations) that I did not succeed in obtaining tangible results. I fully agree with Mr. Sandberg's view that permanent elimination of the smell to the greatest possible extent is attainable only in the fatty acids of the fish-oils; the subsequent treatment according to Sandberg, however, disappointed me in many experiments. Even distillation of the fatty acids did not give the desired result.

According to Alexandre de Hemphinne, of Ghent,§ the fish-oils, etc., are exposed to the action of electric discharges in an aqueous atmosphere.

It has been suggested to eliminate the smell of fish-oils by potassium permanganate. The fish-oils are mixed by stirring with lime and, without heating; while constantly stirring, 4 to 5% of $KMnO_4$, is added until the latter becomes colourless.

Furthermore, calcium carbide was proposed as a means for freeing fish-oils from smell. Calcium carbide deprives substances of water and precipitates the slimy ingredients. The operation takes place in a cylindrical vessel provided with a stirrer. After filling the vessel with fish-oil, 10% of powdered calcium carbide is added. After the development of acetylene a greenish mixture occurs. As soon as the development of acetylene ceases, the oil is allowed to settle, and is filtered from the sediment.

According to Nordlinger,* salts of heavy metals, with higher grade fatty acids (for instance, lead oleate or iron stearate) are employed for the elimination of smelling substances from, and the purifying of, the fats. It is hardly likely that this patent would be adopted for practical use.

After so many trials made in this direction with the most varying combinations, it may be concluded that by chemical agents alone the desired end—viz., a product as free from smell as possible—will not be attained, and that mechanical force will be required in addition, in order to do away with the drawback in question.

(*To be continued.*)

* I will revert further on to the treatment of fish oils with concentrated H_2SO_4.

† These agents will be referred to again later. ‡ German Imp. Pat. 102,638.

COMPANY MORTGAGES AND CHARGES.

THE following mortgages and charges have been registered:—

Alabama Portland Cement Co., Ltd.—Mortgage dated Oct. 2, 1907, to secure $10,000., charged on about 15,000 barrels of cement, and all the company's mules, waggons and carts (all at Marengo County, Alabama, U.S.A.), registered.

Bearcreek Oil and Shipping Co., Ltd.—Issue on Oct. 4, of £3,700 4½% debentures, part of series created by resolutions of various dates from June 3, 1903, to Oct. 4, 1907, to secure not more than £6. per ton upon the gross registered tonnage of the vessels in actual working at the time of borrowing, charged on the company's undertaking and property, present and future, including uncalled capital. No trustees. Previously issued of same series, £12,310.

Buxton Lime firms Co., Ltd.—Issue on Sept. 26, of £20,000. 5% debentures, part of series created Nov. 19, 1891, to secure £200,000, charged on the company's undertaking and property, present and future, including uncalled capital. Previously issued of same series, £152,800.

Durban Oil and Soap Co., Ltd.—A notarial bond or mortgage dated Oct. 31, 1906, to secure £10,000., was filed on the 4th inst., pursuant to an Order of Court. Property charged: The company's stock of soap, manufactured or in course of manufacture, and oils, oil cakes and materials used in the manufacture thereof, wooden boxes, packing cases, etc. A notarial bond or mortgage dated May 4, to secure £25,000., and as collateral security thereto a mortgage bond dated May 22, 1907, were also filed on the same date, pursuant to said order. Property charged (by notarial bond): As above, together with all goods purchased or imported by the company, all bills of lading or documents of debt representing goods in transit; all book debts, present and future, the goodwill of the company's business, and all its buildings, furniture, plant, fittings, etc. (By collateral mortgage bond): Seven pieces of land, forming part of the Farm Wentworth, Durban, together with all buildings which are or may be erected thereon, and all moneys derivable therefrom.

Sussex Portland Cement Co., Ltd.—Re-issue on Oct. 4 (for five years) of £2,600. 4% debentures, part of series created Oct. 22, 1885, to secure not more than 25% of the nominal share capital for the time being issued, charged on the company's undertaking and property, present and future, except uncalled capital. No trustees. Previously issued of same series, £23,100.

Legal Departments in Business Establishments.—A correspondent writes:—The employment of lawyers in business offices is growing more and more. Last year the Birmingham Small Arms Co. engaged a rising city solicitor to organise a department to look after their legal and patent work. Now Brunner, Mond and Co. are moving on similar lines. In last week's *Law Times* they advertise for a solicitor (honoursman) "Not to take the place of their ordinary solicitors, but to do various legal and secretarial work in connection with the Company." All over America the legal department is a prominent feature of business life. No doubt it will be so here in time. One of the difficulties at present is the comparatively high salaries commanded by the men who have sufficient executive ability and organising skill.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements relating to Apparatus for Automatically Analysing Mixed Gases and Recording the Percentage therein of one of the Gases. W. S. Hubbard, Kent Street Works, Leicester. British Patent, 19,513. September 1, 1906.

The claims of this specification are:—(1.) In an apparatus continuous in action for automatically analysing and recording intermittently the proportion of one gas in a mixed gas, and affording indication by which the character or quality of the mixed gas can be gauged, wherein a vertically reciprocating body makes a definite stroke, and operates a measuring vessel and a re-measuring vessel with means attached for recording the percentage of gas absorbed in the absorbing vessel, relative to the first measured quantity, means whereby a quick definite stroke is imparted to a valve slide over face of valve, with connections for controlling the direction of the gases to be analysed in the apparatus. (2.) In an apparatus as claimed in Claim (1) the combination of a vertically reciprocated body adapted to actuate a body or counterpoise pivoted for vertical swing, a cam which moves with the counterpoise and provides a lock and release motion to means by which a slide is caused to move over the face of a valve controlling the direction of gases from the flue to pump, thence into air and exact measuring vessel, through absorber to remeasurer with means for recording on a diagram the quantity of gas absorbed. (3.) In an apparatus of the character described in Claim (1) a valve provided with nozzles, a connection to one of the said nozzles through which gas is drawn or sucked from a flue or other source, and nozzles to connect the valve with the pump, measuring vessels, and gas-absorbing vessels, and a slide automatically moved a definite stroke, by which the ports on the face of the slide open the ports on the valve to change the course of the gases. (4.) In an apparatus of the character described in Claim (1) a slide valve having means of connection with the chimney or draught to keep the gases moving so that the sample is always fresh.

Improvements relating to the Manufacture of Camphene. J. N. Goldsmith, of the Xylonite Works, Brantham and the British Xylonite Company, Limited, also of Brantham. British Patent, 21,180. September 24, 1906.

This invention relates to the manufacture of camphene, the chief object being to enable this substance to be prepared from pinene hydrochloride in a simple and efficient manner. It is well-known that the preparation of camphene has been effected by heating pinene hydrochloride with ammonia, amines, or soap under high pressures. It has also been proposed to manufacture camphene by melting pinene hydrochloride with alkali phenate or boiling with an aqueous solution of an alkali salt of naphthol or other phenols. The inventors have found that camphene may be produced by employing salts of phenols in non-aqueous solutions, such as alcoholic solution.

According to the invention, camphene is prepared by heating pinene hydrochloride with a salt or salts of naphthol or other phenols in non-aqueous solution. Salts of alpha-naphthol or beta-naphthol may be employed, or salts of either of the three cresols, namely ortho-, meta-, or para-cresol, or mixtures of any of these compounds. For the purpose of the invention, pinene hydrochloride, beta-naphthol and caustic soda may be heated together in alcoholic solution and under normal or other appropriate pressure. In place of caustic soda and beta-naphthol, the sodium salt of beta-naphthol or other phenols, may be employed. When the reaction is complete the alcohol may be distilled off, a certain amount of camphene and water distilling over at this stage. The remaining camphene is driven over by steam or may be extracted by a liquid such as petroleum spirit. The alcohol may be recovered and used again. The beta-naphthol may be also recovered and used again together with the solvent for converting a fresh quantity of pinene hydrochloride into camphene.

As above stated, it has before been proposed to heat potassium phenate with pinene hydrochloride for the production of camphene. Other salts of phenols, as, for example, the sodium salt of beta-naphthol, may be employed in a dry state, that is to say, they may contain so little water as to be in a hard solid condition at the ordinary temperature.

Improvements in Gas Generators. J. G. L. Bormann, Schluterstrasse 28, Charlottenburg. British Patent, 10,226. May 2, 1907.

The invention relates to those generators in which the production of combustible gases is effected by the admission of the air required for combustion into the upper part of the generator shaft, whilst the complete gasification of the coal at the lower end of the generator shaft is effected by means of the introduction of steam. Hitherto in generators of this kind the eduction flues, through which the combustible gas formed is conducted out of the generator, were made very narrow and arranged in the walls of the generator shaft without any provision for cooling. Hence arose the drawback that these flues readily became choked up by the ashes and coke particles carried along with the gas, and that in particular the inside outlets of these flues were blocked up by the clinker and coke caking firmly on the hot walls of the generator shaft.

The subject matter of the present invention is to obviate this effect by an improved form of the gas eduction flue and the provision of an extensive cooling arrangement of the lower parts of the generator shaft containing the gas eduction flue. For this purpose the apertures of egress and the eduction flue for the combustible gases are made as wide as possible, and are built into a ring-shaped water boiler which surrounds on all sides the lower part of the generator shaft. In order to avoid the accumulation of steam in this water boiler the top part of the latter is made to slope steeply up towards a steam-collecting reservoir fitted above, preferably at the side. The steam boiler may conveniently be divided into several ring-shaped parts adapted to the shape of the generator and the eduction flue, which parts have openings interconnecting them, and possess such a shape that they penetrate far into the spaces to be cooled or approach them as closely as possible, so that an effective cooling of the latter is ensured.

THE RUSSIAN CHEMICAL MARKETS.

According to a report, dated October 16, the Moscow chemical market was relatively firm in tone; but little business is doing, and the quotations ruling present no special feature.

The St. Petersburg market report of October 15 observes that the preceding fortnight saw a number of changes in the prices of various chemicals. These changes were for the most part of slight importance, and consisted in both rises and falls, frequently the result of variations in the cost of metals. Although the price of copper on the London market has fallen by nearly 50%, the local price for copper salts have changed but little. The same observation in varying degree applies to zinc, tin, etc. Higher prices are noted in borax, sal ammoniac, potassium bichromate, Chili saltpetre, etc., whilst there have been declines in sulphate of copper, alum, etc. There is a livening up in tone in anticipation of early winter purchases.

NEW YORK PRICES CURRENT.

Market Reports.

THE AMERICAN CHEMICAL MARKET.

NEW YORK, October 8, 1907.

(Rate of Exchange, $4.86 = £1.)

Nitrate of soda is steady, at $2.37½. to $2.40. Sulphate of ammonia inclines to dulness, at $3.07½. to $3.10. Bleaching powders are firm but slow, at $1.25. to $1.30., as to make. Alkali and caustic soda are without quotable change. Sulphate of copper is reduced to 6c. per lb. by the syndicate, and outside makers are offering 5⅞c. per lb. White powdered arsenic is very dull, and the prices are 7c. per lb. for prompt, and 6⅞c. per lb. for shipment. Red Saxony arsenic is unchanged at 7½c. per lb. Calcined carbonate of potash, 80-85%, remains 3¾c. to 3⅞c. per lb., while hydrated is 4¼c. per lb. Caustic potash, 75%, is 4⅝c. per lb. Chlorate of soda is 8½c. per lb., and potash, crystals, 8¾c. per lb., f.o.r. makers' works. Bichromate of potash and soda are unchanged, at 8⅛c. and 7⅞c. per lb. respectively. Prussiate of soda is weak, at 9½c. per lb., and potash is dull at 15⅝c. per lb. Antimony products have been advancing: oxide is now quoted at 12c. per lb., and needle 9c. per lb., with the market slow but strong. Oxalic acid is weaker on spot at 8c. per lb.

THE LONDON METAL MARKETS.

Friday.

Copper: Standard brands, £55. 15s. to £56. cash, and £55. to £55. 5s. three months. Tin: G.M. quality, £138. 15s. to £139. 5s. cash, and £137. 15s. to £138. 5s. three months; English, £141. Lead: Soft foreign, October, £18. 15s.; November, £18. 7s. 6d.; January, £17. 13s. 9d. to £17. 15s.; English, £19. to £19. 5s. Spelter: Ordinary brands, November, £21. 15s.

TAR AND AMMONIA PRODUCTS.

FRIDAY.

Benzols quiet, with quotations given at 8½d. to 8¾d. for 90's, and 9d. for 50-90's, casks included. Crude tar, 15s. to 19s. per ton Thames; 1¼d. to 1⅜d. per gallon delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 24s. 9d. to 25s. 3d., f.o.b.; Gas Company, 27s.; East Coast, 24s. 6d. to 24s. 9d.; West Coast, 23s. 6d. to 24s. Refined naphthalene, £6. 10s. to £8. 10s., packages included. Toluol, 90%, 10d. to 10½d.; pure, 1s., casks included. Carbolic acid, crude, 50%, 1s. 5½d. to 1s. 5½d.; 60%, 1s. 8d.; 75%, 1s. 11¼d. to 2s., casks included. Crystals, 39-40, 5⅜d.; 34-35, 5d. Cresylic, 95%, 1s. 1d. to 1s. 1¼d. Anthracene, 40 to 45% A, 1½d. to 1¾d., casks included. Pyridin, 4s. to 4s. 3d. Sulphate of ammonia firm. Nearest values are:—Beckton, October-December, £12. 5s.; Jan.-April, £12. 7s. 6d.; Beckton terms, £12.; London, £11. 16s. 3d. to £11. 17s. 6d.; Hull, £11. 18s. 9d.; Liverpool, £12.; Manchester, £11. 17s. 6d.; and Leith, £12. 5s.; forward, £12. 7s. 6d.

Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 9d.; Liverpool, ordinary, 11s. 3d., and refined, 11s. 4½d. Cargoes, off coast or due, 11s.; ditto for prompt shipment, 11s. 3½d.

FERTILISER MATERIALS.

FRIDAY.

There is no new feature to comment upon in any of the markets for manure material, manufacturers being busily occupied in the preparation of manures.

Mineral phosphates of all grades remain unchanged, raisers having sold well ahead, being for the most part indifferent about committing themselves to further contracts.

East Indian bone meal for shipment is easier, shippers now inviting offers of £4. 17s. 6d. per ton, nett, c.i.f. terms, Liverpool, 4½ and 52% quality; on spot, £5. 5s. to £5. 10s. per ton, according to quality, ex store, is required.

Nitrate of soda, although still quiet, is very steady at 11s. 3d. to 11s. 6d. per cwt., according to quality, ex store.

MISCELLANEOUS CHEMICAL MARKET.

FRIDAY.

The markets generally are steady, and there have been no changes of material consequence to record during the week. In the alkali trade a good all-round demand is maintained for all the main products. Sulphate of copper remains nominally at £21. 10s. for prompt and early delivery, and £21. for spring. Caustic soda, 70%, £10. 5s., f.o.b. Liverpool. Alkali, 58%, in bags, £4. 10s., f.o.r. Bleaching powder, £4. 7s. 6d., f.o.r. and f.o.b. Chlorates, 3½d. per lb. Saltcake, in bulk, 42s. 6d. per ton, delivered to principal buyers' stations, is the price for prompt and future delivery. Prices are very firm for potash, caustic and carbonate, but there is no change during the week. Acetate of lime and all other acetates keep very steady in price, both for early and forward deliveries. Acetic acids are rather more freely offered. Oxalic acid is steady, at 3¾d. per lb. Lead salts are firm: White sugar of lead, at £31.; brown at £26. Prussiates are steady, and there is a more evident firmness in soda, at 3¾d. and potash at 5¾d. per lb. Green copperas scarce and generally dearer. Ammonia and salts of ammonia continue to realise full current quotations without difficulty.

LIVERPOOL DRYSALTERIES.

THURSDAY.

Montreal potashes quiet, but firm at 36s. per cwt. Logwood steady, at late prices. Cutch steady. Gum copal: Gold Coast sold at auction, 55s. to 56s. 6d. per cwt. Castor oil firm in all positions at 3¾d. for good seconds Calcutta on to January next, and 3½d. on spot; French offering at 3½d. for first pressure, and 3¼d. for second pressure. Gambier: Block, 22s. 6d. per cwt. for parcels on quay, and 23s. for store lots; October-November shipment, 21s. Cubes, 30s. per cwt., on spot, and 28s. 3d. per cwt. for November-December shipment. Shellac steady, at 147s. 6d. for fair TN orange, on spot. Glucose firm: American liquid, 43%, 12s. 6d. on spot, and 12s. for October-December delivery; for prompt shipment, 10s. 1½d., and for October-December, 9s. 7½d., c.i.f., for shipment. American powdered starch, 11s. on spot, and 10s. 6d., c.i.f., for shipment. Pearl, 10s. 7½d. on spot, and 10s., c.i.f., for shipment. Cream of tartar, 98% foreign powder, 87s. to 88s.; 95%, 85s. to 86s. Tartaric acid: English, 11¼d. on spot, and foreign, 11d. Citric acid: English, 1s. 9d.; foreign, 1s. 9¼d.

LIVERPOOL OIL AND COLOUR MARKET.

THURSDAY.

OILS.—Palm oil firm, and in improved inquiry, sales including Benin afloat at £28. 10s., and on spot £28. 15s.; Accra, on spot and soft oils for November-December delivery £28. 15s., and the latter for December-January delivery, at £29.; Lagos, on spot, £32., and for October-November, £31. 10s., all in transit. Linseed oil firm, at 26s. 9d. to 27s. 6d. per cwt. for Liverpool makes in export casks. Cottonseed oil steady, at 27s. to 28s. per cwt. for Liverpool refined in export barrels. Tallow quiet. Turpentine firmer, at 39s. 3d. per cwt. for spot parcels. Petroleum firm, at 7d. for Russian and Roumanian, and 7½d. to 8½d. per gallon for American refined oils. Petroleum spirit steady, at 1s. 0½d. to 1s. 3d. per gallon.

HULL PAINT, OIL, AND COLOUR REPORT.

THURSDAY.

OIL.—Seed oils, after the late advances, have maintained their positions, and are dearer by 5s. to 7s. 6d. per ton. Turpentine also is firmer. Linseed shipments here last week were only small, and crushers are only buying hand to mouth, as the anticipated crop in the Argentine is expected to be heavy. Cottonseed is fetching full prices. Egypt is shipping freely, with little offering from Bombay. Linseed imports for week are:—19,015 qrs., making total imports for year 664,367 qrs., against 477,027 qrs. last year. Rapeseed imports nil; total for year 90,184 qrs., against 98,595 qrs. last year. Cottonseed imports, 5,254 tons; total for year 269,258 tons, against 214,991 tons last year. Amongst the weekly imports are:—Margarine, 2,604 cwts.; lard, 3,985 cwts.; sugar, 13,978 cwts.; hides, 966 cwts.; colours, 997 pkgs.; wool, 414,532 lbs.; hemp, 632 cwts.; oilcake, 69 tons. Exports:—Oil, 10,214 cwts.; colours, 2,316 pkgs.; chemicals, 2,126 pkgs. Linseed oil, naked, spot, 24s. 9d.; October-December, 24s. 4½d.; January-April, 23s. 3d.; boiled and refined, £1. to £1. 10s. per ton extra. Exports 20 tons for week, against 242 tons same week last year. Rape oil dearer; 38s. 3d. for refined. Refined cotton oil, 23s. 9d.; November-April, 23s. 6d. paid; casks £1., barrels £1. 10s. per ton extra. Total exports for the week, 89 tons, against 125 tons for the same week last year. Castor oil made here, spot, £30. 10s.; seconds, £29. 10s.; January-June, same prices. Turpentine, spot, 39s. 6d.; November-December, 40s.; January-April, 41s.; May-June, 40s. 6d.; Russian, 21s. Olive oil, Levant, £39. to £40. per tun. Linseed, La Plata, sold at 45s. 6d. to 45s. 9d., spot; September-October is 46s. 3d.; October-November, 46s. 6d.; 500 tons sold November-December, 45s. 10½d.; January-February sold 43s. and 43s. 3d. paid. Cottonseed, spot, £7. 10s. paid; passage quoted £7. 8s. 9d. to £7. 7s. 6d.; October sold £7. 6s. 3d.; November-January sold at £7. 6s. 3d.; Bombay, November-December, quoted £6. 5s. Rosins unchanged.

CAKES.—In good request, with prices unchanged and firm.

TYNE CHEMICAL REPORT.

THURSDAY.

Market continues steady, and generally there is a good demand for most heavy chemicals. Caustic soda is firm, at £10. 5s. for 70%, and £11. per ton for 77-78%. Bleaching powder, £5. to £5. 5s. per ton. Soda crystals, locally, quiet, at £3. to £3. 2s. 6d. per ton, gross weights. Sulphur firm, at £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate

Digitized by Google

of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £29. 10s. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—Market is again somewhat easier, and at the moment business slow, new trade being difficult to negotiate. To-day's quotations:—Best Northumbrian steam, 15s. to 15s. 6d. per ton; second qualities, 14s. to 14s. 6d. per ton; small steam, 10s. 6d. to 11s. per ton; Durham bunker coals, 12s. 6d. to 13s. per ton; coking coals, 14s. per ton; gas coals, 14s. 6d. to 14s. 9d. per ton; household coals, 16s. 6d. to 17s. per ton; foundry coke, 22s. 6d. per ton; gas coke, 19s. to 20s. per ton.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Thursday.

All paraffins and mineral oils continue on an evenly steady market, with some little added firmness in the section of the lubricating oils. Whale oils on Glasgow market are also steady on a range of 18s. to 25s., black to pale. The fortune of the Scottish fleet of whalers in the Arctic waters has this year been very bad—very nearly a complete failure—and with the total wreck and loss of at least one ship. The tendency, so far as it extends, points, of course, to an increased firmness on the home market. Recent improvement in sulphate of ammonia, prompt f.o.b. Leith, continues, and value now is a good £12. 5s., this price having been several times paid. Forward dealing, however, is again quieter, after £12. 5s. done as the top figure. The ordinary heavy chemicals for the most part are steady and firm, especially bleaching powder, which is well sold forward over 1908, at a fractional increase. Creosote oil firm at recent figure.

Chief prices current are:—Alum (in lump), £5. 5s. to £6., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 15s. to £5., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3½d., nett, Glasgow; creosote (ordinary coal-tar and blast furnace), 2¼d. to 2½d., naked, f.a.s. Glasgow; nitrate of soda, 11s. 4½d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2¼d. to 2½d. per lb.; paraffin wax, 120°, semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¾d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating) 805°, £5. 15s. to £6. 5s.; 885°, £6. 15s. to £7.; 890-895°, £7. 10s. to £8.; prussiate of potash, 5¾d. to 5⅞d., nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £2. 17s. 6d. to £3.; sulphate of ammonia, £12. 5s., prompt, f.o.b. Leith; sulphate of copper, £22. 10s., to £23., less 5% Liverpool, prompt.

New Companies

Bickerton Copper Mines Syndicate, Ltd.—Capital £750., in £1. shares. This syndicate has been formed to acquire the benefits and obligations of certain agreements granting options for leases of the Bickerton Copper Mines, Cheshire, to adopt an agreement with M. J. Regan, and to carry on the business of copper and general miners, prospectors, explorers, metallurgists, financiers, etc. No initial public issue. The subscribers are to appoint the first directors; qualification £50. ordinary shares.

Biskra Development Co., Ltd.—Capital £100,000., in £1. shares. This company has been formed to acquire concessions, agreements, contracts, rights and profits, belonging to Dr. J. V. R. Fauvelle or other persons, granted by the Commune of Biskra, Algeria, the Government of Algeria, the French Government and others relating to matters and operations dealing with real property and with agricultural, mining, commercial, manufacturing and colonisation ventures and other enterprises in Algeria, etc. No initial public issue. The first directors are Dr. R. Fauvelle (managing director for 10 years) and others to be appointed by the subscribers; qualification £50.; remuneration 10% of the profits in any year when 5% is paid on the shares., divisible, and £2. each per board meeting attended. Before recommending any dividend the directors are to set aside 5% of the profits to the reserve fund. Registered office, 3, East India-avenue, E.C.

Union Anti-Fouling Composition Co., Ltd.—Capital £25,000., in £1. shares. This company has been formed to carry on the business of manufacturers of anti-fouling and anti-corrosive compositions, etc. J. B. Murray is the first director; qualification 250 shares. Registered office, 24, George-square, Glasgow.

LATE ADVERTISEMENTS.

CHEMICAL Plumber seeks a Situation, experienced workman, good references.—"1,559," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

MINERALS rich in Titanium, Tungsten, Molybdenum. Large quantities for sale.—Apply, Thos. W. Ward Limited, Albion Works, Sheffield.

MANAGER.—Smart Business Man, with good knowledge and all-round experience of chemical trade, wants responsible position. Excellent qualifications, good organiser and accustomed to control.—Box "1,558," *Chemical Trade Journal* Office, 265 Strand, London, W.C.

WANTED a New Process for Regenerating Bichromate of Soda from Spent Oxidising Liquor.—Box "1,561," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

A QUANTITY of useful Ebonite Piping and Cocks, ½ to 2½in.; also one Copper pan, dome top, 5ft. high, 5ft. 6in. dia. at top, 4ft dia. at bottom, with flange outlet pipe; one ditto, 4ft. 9in. dia. bottom, 5ft. 6in. top, 18in. deep, 3in. flange.—H. Schumacher and Co., Limited, Charlton, S.E.

WORK'S CHEMIST, F.I.C., accustomed to Research Work, with considerable practical experience, a good general knowledge of physics and a special experience of water softening; now disengaged, desires appointment.—Address, No. "1,557," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

WANTED.—An intelligent and experienced Foreman for a department of a Chemical Works near Huddersfield. One capable of managing men and plant required.—Apply, stating experience and wages required, to "1,563," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

CURRENT TOPICS.

COMMERCIAL ATTACHES AND AGENTS.

A report by Sir E. Gorst and Mr. Llewelyn Smith, on Commercial Attachés and Agents, which has just been issued, contains some interesting recommendations for dealing with the defects of the present system of representation.

It is recommended that the existing Commercial Attachés should have their headquarters in London, and should divide their time between special investigations abroad, work in the Board of Trade, in the Commercial Department of the Foreign Office, and visits to manufacturing districts in the United Kingdom. In view of the wide areas assigned to Commercial Attachés, it would be more convenient for them to start from London, while their inquiries would be of very much greater value if directed to special objects by instructions from the Department, or the Commercial Intelligence Committee, or by experience gained in systematic visits to British commercial centres. The Commercial Attachés at the more distant ports, and in countries such as Turkey, China, etc., should continue to have their headquarters in those countries, but to move about within their districts and pay periodical visits to the principal centres of English industry.

The functions at present performed by Commercial Agents should, it is suggested, be discontinued, and assigned instead to members of the Consular Service, which should be increased where necessary. The current commercial business of the Diplomatic Missions should be in charge of a specially selected member of the Diplomatic staff designated by the Head of the Mission, and receiving special allowance while actually discharging its functions. The annual sum of £1,000. would, it is estimated, cover the necessary expenditure. In order that the commercial community may realise that there is a special officer in each Mission with whom they can communicate on commercial questions, the member of the staff selected for this purpose should have a distinctive title.

SMOKE AND CONSUMPTION.

The *Frankfurter Zeitung* states that during the last twenty-five years the mortality from consumption in Germany has been steadily on the increase. This is particularly noticeable in manufacturing districts, such as the Rhenish counties in the Prussian Black Country. Smoke directly predisposes to lung disease, and is very favourable to the advance of tuberculosis. The chief blame for the smoke nuisance must, however, be attributed to the domestic and not the industrial chimney—a point which has been emphasised in these columns on several occasions. The only remedy for the smoke nuisance, in the opinion of the writer in the *Frankfurter Zeitung*, would be for the law to compel the creators of the nuisance to live within their

Digitized by Google

sphere of influence; but this, like all drastic measures, will not be attained until the public takes a real and absorbing interest in healthy conditions of town life.

THE VIOLATION OF FOREIGN TRADE MARKS.

The growing evil of the illegal practices of Japanese traders is the subject of an article by a correspondent of the *Manchester Guardian*. "The high tariff," says the writer, "now imposed on all foreign imports, forbids their use to the majority of people in Japan, and in consequence of this traders are tempted to resort to fraudulent methods. Japanese courts afford no protection to duly registered trade marks, and the offender is allowed to carry on his infringement of them with impunity."

A notable case of this kind has just been dismissed from the Japanese courts. A Japanese wine merchant appropriated the trade mark of Messrs. James Buchanan and Co.—the makers of the well-known "Black and White Whisky"—and did a flourishing trade in Scotch whisky made in Japan. The British firm prosecuted the offender, asserting that he had not only violated the trade mark regulations of the Empire, but had caused them serious losses by imitating their goods. The accused pleaded guilty to the charge, but the judge turned from the point at issue and ordered an investigation as to which of the two makes of whisky was the better; this irrelevant question being decided in favour of the Scotch firm, the judge passed a verdict of "not guilty" on the defendant! The case was carried into a higher court, but with the same result. This is but one instance of the judicial logic of Japan.

The writer observes that Japan's commercial reputation abroad is being seriously affected by such judicial ruling. Close imitations of various kinds of foreign articles are being constantly produced and sold, not only in Japan, but in China, Korea, and Manchuria, as genuine foreign goods. An example of this may be seen in the case of Messrs. Carlowitz and Co., whose registered name had been used through the whole of China by a Japanese merchant of Osaka; but the verdict of the Japanese Bureau was that the accused's action did not constitute a breach of the law, as the name of the foreign firm—they had used it for nearly thirty years—was not established as exclusively their own. Amongst other successful imitations may be cited Huntley and Palmer's biscuits, Bryant and May's matches, and many other first-class foreign productions. The average Japanese or Chinese customer does not examine a label; he is influenced chiefly by the foreign trade mark, and, except in the matter of cottons and such like goods, will buy the article with the most familiar trade mark, and with but little thought as to its real quality.

NITRATE OF SODA.

A financial crisis has been reached in Chili, and money has become extremely dear in Germany. This combination of adverse circumstances in the home and principal outlet respectively of the fertiliser has naturally exercised an unfavourable influence on the market, which remains weak in all positions, sales being more particularly pressed on the West Coast. In the absence of buyers, prices are quite nominal at about one shilling per quintal below those paid at this time last year for prompt shipment; the reduction in the case of cargoes is not more than ninepence per cwt., but buyers, who twelve months ago were numerous, are now not to be found. Fortunately for holders the east wind has delayed arrivals, but many vessels are due at port of call, and the market will be fairly tested at an early date. In the meantime, valiant efforts are being made to support it by means of private estimates of small shipments and restricted output. Interesting developments are at hand.

SOCIETY OF CHEMICAL INDUSTRY.

SCOTTISH SECTION.

A MEETING of this Section took place in Glasgow on the evening of Friday, October 25, in the Chemical Department of the University Buildings. The Chairman of the Section, Mr. John S. Macarthur, presided, and there was a fair attendance of members. Mr. Emil Westergaard delivered a paper, illustrated by diagrams, on "The Use of Lovibond's Tintometer, and its Application to the Analysis of Potable Spirits," in which he dealt with the determination of minute quantities of acetaldehyde and furfurol by means of colour reactions, and the use of Lovibond's tintometer for that purpose. There was also considered at some length a suggestion for a new method of using the tintometer, and for the extension of its use to colour reactions in general. The latter part of the paper dealt with the results obtained from an examination of samples of different whiskies, to the number of three dozen in all. A discussion of the subject followed the reading, and a hearty vote of thanks was awarded to the author.

The only other paper on the agenda was one on the "Production of High Vacua by Calcium," by Mr. Frederick Soddy, M.A. This paper dealt with Mr. Soddy's electric furnace for heating substances to high temperatures in glass vessels, capable of being exhausted to a high vacuum, and with the use of calcium in the furnace for the absorption of gases, the production of high vacua, and of inert atmospheres such as argon. In this case, also, informal discussion followed the reading.

MERCURY PRODUCTION IN RUSSIA.

THE *Viestnik Finanssoff* gives a table of the results of mercury smelting in Russia which, concentrated as it is in the factory belonging to the A. Auerbach and Co. mercury establishment, near the Nikitoff Mercury Mines, which belong to the company named, still declines in volume. The decrease for the first seven months of this year is from 7,857 poods last year to 5,177 poods. In order to show the progress of the decline, last year's productions are given month by month, in poods, against the corresponding month of this year.

"Thus we see," continues the journal, our "relatively small production falls away month by month, and there is reason to fear that in the near future it will be reduced to nil; for on the one hand there is the unfavourable tendency of the world's mercury market, and on the other the increased cost of extracting the ore at the Nikitoff Mine, which must soon (if it has not done so already) make mercury production an unprofitable undertaking in Russia.

INSTITUTE OF CHEMISTRY.—The annual dinner of the Institute of Chemistry will be held at the Whitehall Rooms, Hotel Metropole, W.C., on the evening of Friday, November 22, 1907, at 7-30 o'clock. Professor Percy F. Frankland, LL.D., F.R.S., President, will be in the chair. The event will celebrate the 30th anniversary of the foundation of the Institute.

GERMAN CHEMICALS.—The shareholders of the Elberfeld Colour Works and Badische and Berlin Anilin Companies agreed at special meetings held last week to the increases of capital proposed by their respective boards. The increase will be £750,000. (to £1,800,000.) in the case of each of the first two concerns, and £250,000. in that of the third, the issues of new shares being guaranteed by leading bankers. In order to be independent of the Coal Syndicate in the matter of fuel supplies, the above Companies have secured, at the price of £885,000., a controlling interest in the Auguste Victoria Collieries, on which it is further intended to expend a million sterling in development work in the course of the next ten years. The balance of new capital will be used in connection with the Norwegian Artificial Nitrate Works already referred to in these columns. A considerable fall has taken place in the shares of these Companies in view of an expected reduction in dividends, pending the full development of the new business.

THE REVISED BRITISH STANDARD SPECIFICATION FOR PORTLAND CEMENT.

[*Reprinted, by permission of the Editor, from "Concrete and Constructional Engineering," September, 1907.*]

PROBABLY no one welcomed the formation of the Engineering Standards Committee in the year 1903 more than the British cement manufacturer, who for years had been labouring under the not inconsiderable difficulties of having to produce his cement to a multiplicity of specifications to suit the constantly varying ideas and requirements, and even fads, of engineers, not only in this country, but in the Colonies and abroad. Almost every engineer and architect had his own views as to fineness of grinding, strength, and chemical composition, for which in many cases he could give no adequate reason; while a variety of tests were in vogue, many of which were of small practical value in determining the true quality of the product. These fads and fancies undoubtedly put the manufacturer to very considerable inconvenience in preparing cement for the market, and often resulted in serious friction between seller and buyer, as beyond all question parcels of cement were frequently rejected by engineers of good repute either at the works, or—what was worse from the manufacturer's point of view—after delivery, which were of first-rate quality and quite equal to the standards set up by other equally eminent engineers.

It has been said that special requirements necessitate special specifications. Although this is undoubtedly true so far as the setting properties of the required cement are concerned, there is no reason why a specification should not be devised acceptable alike to the manufacturer and to the professional man, which would procure the manufacture of a cement of unimpeachable quality and suitable for every purpose. Such specifications have been satisfactorily in use abroad for many years past, and the success which attended the introduction of the British Standard Specification some three years ago is sufficient evidence that a uniform standard specification filled a much-needed want in this country. It was immediately adopted by Government Departments, municipal authorities, harbour and water boards, railway companies, and, indeed, almost all the principal users of Portland cement throughout the country, and also very largely in the British Colonies and Dependencies. Its effect upon the product itself has been great, and a considerable percentage of the cement now manufactured in this country conforms to the high standard laid down in the specification, largely due to the finer grinding of the raw material and of the finished product, an expensive matter, which in many cases doubtless has necessitated the provision of new plant, and to more efficient burning and selection of clinker, which also entails additional expenditure.

The British Standard Specification, which has again come prominently before the public on the recent issue of a revised edition, has naturally not escaped criticism, particularly regarding the Le Chatelier boiling test for soundness, which, on its introduction, some authorities, including Mr. D. B. Butler, considered unnecessarily severe, and likely to result in frequent condemnation of good sound cement. The Committee, however, have retained this test in the revised specification, and have even made it somewhat more stringent. The Committee is composed of eminent representatives of the technical professions as well as of manufacturers and of important users, and it may therefore be assumed that they were satisfied that experience extending over a period of three years had fully justified its adoption, and that the fears expressed by certain experts as to the commercial value of this test have not been realised in actual practice. The Faija test for soundness, which Mr. Butler prefers, is a useful one, and one that is still largely employed in the laboratories of the leading works in this country, but the balance of opinion appears to be decidedly in favour of the one adopted by the Committee. In the original specification the limit of expansion after twenty-four hours' aeration was 12 mm., and after seven days, 6 mm.; it has now been reduced to 10 mm. and 5 mm. respectively.

With regard to fineness, no user is likely to quarrel over the reduction in the residue on the 180-mesh sieve, which is now not to exceed 18 per cent. as against 22½ per cent. in the original specification, the residue at 3 per cent. on the 76-mesh sieve remaining unaltered. Fineness of grinding is of prime importance in the production of a high-grade cement, and long ago our leading manufacturers recognised the commercial advantages to be gained from a pre-eminence in this respect. There exist factories in this country producing cement as a matter of every-day practice, with a residue of 5 to 6 per cent. on the 180-mesh sieve, and we doubt if this record is equalled by any concern outside the United Kingdom. The reduction of cement to this exceeding fineness is obviously an expensive operation, for reasons which will appeal to anyone with a knowledge of grinding costs, and it is therefore all the more pleasing that we have in our own country enterprising firms who are not merely content to conform to the high standard required of them, but are determined to be well in advance of it.

The requirements as to tensile strength of neat cement remain without change—namely, 400 lb. per sq. in. at seven days from gauging and 500 lb. per sq. in. at twenty-eight days, but the proportion for the increase from seven to twenty-eight days has been reduced. An increase of 10 per cent. is now required when the seven days' test falls between 550 lb. and 600 lb., and 5 per cent. when the seven days' test is 600 lb. or upwards. The specified tensile strength of sand briquettes has been increased from 120 lb. at seven days from gauging, and 225 lb. at twenty-eight days to 150 lb. and 250 lb. respectively, the percentage of increase from seven to twenty-eight days remaining as before at 20 per cent.

It is a matter of regret that there should be in this revised specification some points of considerable importance which are lacking in that definite and clear description which might have been expected of the Committee, particularly in view of the difficulties which we understand have arisen from the same cause under the old specification, not only as between the manufacturer and the expert, but between the experts themselves. For instance, the quantity of water to be used in gauging is still vaguely defined as "being appropriate to the quality of the cement, and shall be so proportioned that when the cement is gauged it shall form a smooth easily-worked paste that will leave the trowel cleanly in a compact mass." There may be some difficulty in fixing a definite percentage of water which would be generally acceptable, for this depends upon such considerations as the age of the cement, the fineness to which it is ground, and the temperature and dryness of the air, but the description of "compact mass" is capable of being construed very differently by different individuals, and we can well understand that this absence of clearness of expression may result in friction in the future, as we are informed it certainly has in the past.

Then, on the controversial point as to when the cement is really set, the Committee again make use of the following words, which appeared in the original edition:—"The cement shall be considered as finally 'set' when a 'needle' . . . . fails to make an impression when its point is applied gently to the surface." The question will still arise as to what is an impression. It is well known in the trade that pats made of cement of unquestionable quality, particularly that made by the rotary kiln process, will show a *slight* impression some hours after the actual final set has taken place, and it is therefore open to an expert reading the above words literally to reject the cement offered on the ground of its being too slow-setting. It is to be hoped that the Committee will give their serious attention to these important points with a view to more definite description when the time comes for a further revision.

We would venture to make a further suggestion to the Committee—namely, that in any future edition they may publish, the metrical equivalents should be given of the British terms which are used. The British manufacturer, fortunately for himself and for the country at large, carries on a considerable foreign business, and in many markets—for instance, in South America—we think the carrying out of our suggestion would be welcomed by both buyer and seller, and would tend, we feel sure, to a wider adoption of the specification itself outside the United Kingdom.

With regard to setting time, the specification recommends three distinct grades—namely, "quick," "medium," and "slow"; and it is understood that this classification has worked well since it was introduced in 1904. "Quick" is defined as not less than ten minutes nor more than thirty minutes; "medium" as not less than half-an-hour nor more than two hours; and "slow" as not less than two hours nor more than seven hours, as against five in the original edition. In the official *communiqué* of the Engineering Standards Committee it is stated that the Sectional Committee have had under their consideration for some time past the question of making some stipulation as to initial setting time, and experiments have been and are being carried out with a view to the inclusion of a clause dealing with this point.

Digitized by Google

The permissible addition of calcium sulphate (gypsum) at 2 per cent. remains unaltered, but the percentage of sulphuric anhydride has been raised from 2.5 per cent. to 2.75 per cent. We are inclined to doubt whether this will meet with unqualified approval in view of the prejudice which exists among many of our leading engineers regarding the use of gypsum. The percentage of magnesia at 3 per cent. and the insoluble residue at not exceeding 1.5 per cent. remain unchanged. An example is given showing the method of calculating in chemical equivalents the proportion of lime to silica and alumina. The design of the standard needle has been slightly modified with a view to diminishing the risk of injury and to allow of the ready replacement of the point if damaged, but no alteration in the essential features has been made.

One other point of importance may be mentioned, and that is the stipulation which appears in the revision that the cement shall be delivered in packages marked with the manufacturer's name. It is not without interest to observe that the report of the Joint Committee on reinforced concrete, adopted by the Royal Institute of British Architects on May 27th last, and published *in extenso* in the last issue of this Journal (*C. & C.E.*), advocates a similar requirement as to cement delivered for reinforced concrete work. That these two important bodies, acting independently of each other, should be in agreement in this respect is not without significance. It now remains for the consumer, for whose protection this stipulation has been adopted, to see that the requirement is rigidly conformed to.

The Committee are, we understand, making certain investigations, the desirability of which has been brought to their notice, but they decided not to hold back the issue of the present revision pending the completion of these experiments, which are likely to occupy some considerable time. A prospect is thus held out of a still further revision at no distant date. Finality in the matter of a standard specification for cement, like most other things in this world, is not likely to be reached yet awhile, and in the march of progress the labours of the Committee may be in requisition for a long time to come. Meanwhile, the thanks of that large section of the community which is interested in constructional work in this country are due to those gentlemen who have gratuitously given their services in a public cause, and have produced a standard specification which, although possibly still open to some criticism, is of undoubted value, and much in advance of anything that preceded it.

ON THE ELECTROLYSIS OF SALT SOLUTIONS IN LIQUEFIED SULPHUR DIOXIDE AT LOW TEMPERATURES.

BY BERTRAM D. STEELE, D.Sc.*

THE investigation of which this is a preliminary notice is a natural continuation of the research started by Dr. M'Intosh and myself in 1903. The investigation has for its object the study of the electrolysis of salts dissolved in certain liquefied gases, and of the products formed during electrolysis. The first system that has been investigated is that of a solution of potassium iodide dissolved in sulphur dioxide, and a large number of experiments extending over several months have been carried out.

My attention having been called to a proposed investigation along similar lines, of which an abstract appears in the *Journal of the Chemical Society* for April, 1907 (Giuseppe Magri, *J.C.S.*, 92, 11, p. 237), I thought it best to publish the following brief summary of the conclusions that have been so far arrived at :—

(1.) When a nearly saturated solution of potassium iodide in sulphur dioxide is electrolysed between electrodes consisting of thin platinum wires, and with a potential difference of between 10 and 20 volts, a current of about 80 to 100 milliamperes is obtained during the first instant. The current immediately begins to fall rapidly to a value considerably less than 1 milliampere. With a potential difference of about 40 volts apparent gas evolution occurs (possibly ebullition of sulphur dioxide), and on breaking the circuit a polarisation e.m.f. of over 1 volt is obtained.

(2.) With larger platinum electrodes the fall in current is much slower, but after several hours falls to a similar extremely low value. In this case a scarcely detectable polarisation voltage can be observed.

(3.) Similar results are obtained when mercury electrodes are used, but the fall in current is not so marked.

(4.) With platinum and mercury electrodes the current, which is extremely variable and inconstant, appears to depend on the previous history of the electrodes.

(5.) It has been found that a constant and consistent current can be obtained by using a silver, copper, or iron kathode of large area.

(6.) The following changes occur at the anode :

When a platinum anode is used iodine is liberated and dissolved in the surrounding solution.

When a zinc anode is used no iodine is liberated, and the solution remains yellow in colour. It is probable that zinc iodide is formed and dissolved in the solution.

When an iron anode is used no iodine is liberated, but the solution surrounding the anode becomes blackish-green in colour.

When a mercury anode is used mercurous iodide is formed and precipitated, forming a layer on the electrode which appears to cut off the current.

(7.) The following changes occur at the kathode :

When currents of 20 milliamperes and over are used with a platinum kathode there is formed a dark-coloured crystalline deposit, which on drying in an atmosphere of dry sulphur dioxide becomes white. Small quantities of sulphur are always found mixed with this deposit.

The deposit on analysis was found to have a composition very closely corresponding with that required for potassium sulphite, in some cases being, however, much richer in sulphur dioxide.

The platinum kathode, if very small currents are used, is still coated with the potassium sulphite compound, but contains little, if any, admixed sulphur, which is, however, in all cases found dissolved in the solution surrounding the kathode.

The extraordinary manner in which the current falls after the first few moments is thus accounted for by the deposition of a thin film of insulating sulphur on the surface of the kathode.

The deposition of sulphur is prevented by using either a silver or a copper kathode. Under these circumstances a black deposit is formed on the kathode. This deposit is probably silver sulphide or copper sulphide, as the case may be, and as both of these are conducting substances the current is not seriously diminished.

No evidence has yet been obtained of the deposition of potassium as metal on the kathode.

(8.) By means of a specially constructed piece of apparatus the conductivity of the solution in the neighbourhood of the kathode was determined during the progress of the experiment, and in all cases an increase of resistance was observed.

In the same way as the liberation of hydrogen at the kathode during the electrolysis of a solution of potassium iodide in water is regarded as evidence of the occurrence of hydrogen cations in the aqueous solution, so the liberation of sulphur at the kathode in the foregoing experiments indicates the occurrence of sulphur cations in a solution of potassium iodide in sulphur dioxide, and similarly the formation of what is probably potassium sulphite in the latter system is analogous to the formation of potassium hydroxide in the former.

The following is a possible representation of the changes which take place :—

$$S^{\cdot\cdot} + 4\,\Theta = S$$
$$4\,K^{\cdot} + 2\,O'' + SO_2 = 2\,K_2SO_3,$$

the sulphur and the potassium sulphite being deposited together at the kathode.

This would explain not only the formation of these two substances, but also the observed diminution in conductivity of the solution immediately surrounding the kathode.

(9.) After the necessary conditions for obtaining a steady current had been worked out, a special apparatus was designed and constructed for the measurement of ionic velocities of the ions in sulphur dioxide solution, and a few preliminary measurements have been made with this apparatus.

It is intended to extend these measurements and to thoroughly investigate this and other similar systems.

* A paper read before the Faraday Society (communicated by Dr F G. Donnan).

POTASH SALTS IN HOLLAND.—It is reported that while boring for coal at Winterswyk, potash salts were discovered at a depth of about 130 yards.

THE NEW PATENTS ACT.

PART I.—(*Continued from page 375.*)

Term of Patent.

17.—(1.) The term limited in every patent for the duration thereof shall, save as otherwise expressly provided by this Act, be fourteen years from its date.

(2.) A patent shall, notwithstanding anything therein or in this Act, cease if the patentee fails to pay the prescribed fees within the prescribed times; provided that the comptroller, upon the application of the patentee, shall, on receipt of such additional fee, not exceeding ten pounds, as may be prescribed, enlarge the time to such an extent as may be applied for, but not exceeding three months.

(3.) If any proceeding is taken in respect of an infringement of the patent committed after a failure to pay any fee within the prescribed time, and before any enlargement thereof, the court before which the proceeding is proposed to be taken may, if it thinks fit, refuse to award any damages in respect of such infringement.

18.—(1.) A patentee may, after advertising in manner provided by rules of the Supreme Court his intention to do so, present a petition to the court praying that his patent may be extended for a further term, but such petition must be presented at least six months before the time limited for the expiration of the patent.

(2.) Any person may give notice to the court of objection to the extension.

(3.) On the hearing of any petition under this section the patentee and any person who has given such notice of objection shall be made parties to the proceeding, and the comptroller shall be entitled to appear and be heard, and shall appear if so directed by the court.

(4.) The court, in considering its decision, shall have regard to the nature and merits of the invention in relation to the public, to the profits made by the patentee as such, and to all the circumstances of the case.

(5.) If it appears to the court that the patentee has been inadequately remunerated by his patent, the court may by order extend the term of the patent for a further term not exceeding seven, or, in exceptional cases, fourteen years, or may order the grant of a new patent for such term as may be specified in the order and containing any restriction, conditions, and provisions the court may think fit.

19.—(1.) Where a patent for an invention has been applied for or granted, and the applicant or the patentee, as the case may be, applies for a further patent in respect of any improvement in or modification of the invention, he may, if he thinks fit, in his application for the further patent, request that the term limited in that patent for the duration thereof be the same as that of the original patent, or so much of that term as is unexpired.

(2.) Where an application containing such a request is made, a patent (hereinafter referred to as a patent of addition) may be granted for such term as aforesaid.

(3.) A patent of addition shall remain in force so long as the patent for the original invention remains in force, but no longer, and in respect of a patent of addition no fees shall be payable for renewal.

(4.) The grant of a patent of addition shall be conclusive evidence that the invention is a proper subject for a patent of addition, and the validity of the patent shall not be questioned on the ground that the invention ought to have been the subject of an independent patent.

Restoration of Lapsed Patents.

20.—(1.) Where any patent has become void owing to the failure of the patentee to pay any prescribed fee within the prescribed time, the patentee may apply to the comptroller in the prescribed manner for an order for the restoration of the patent.

(2.) Every such application shall contain a statement of the circumstances which have led to the omission of the payment of the prescribed fee.

(3.) If it appears from such statement that the omission was unintentional and that no undue delay has occurred in the making of the application, the comptroller shall advertise the application in the prescribed manner, and within such time as may be prescribed any person may give notice of opposition at the Patent Office.

(4.) Where such notice is given the comptroller shall notify the applicant thereof.

(5.) After the expiration of the prescribed period the comptroller shall hear the case and, subject to an appeal to the court, issue an order either restoring the patent or dismissing the application: Provided that in every order under this section restoring a patent such provisions as may be prescribed shall be inserted for the protection of persons who may have availed themselves of the subject-matter of the patent after the patent had been announced as void in the illustrated official journal.

Amendment of Specification.

21.—(1.) An applicant or a patentee may at any time, by request in writing left at the Patent Office, seek leave to amend his specification, including drawings forming part thereof, by way of disclaimer, correction, or explanation, stating the nature of, and the reasons for, the proposed amendment.

(2.) The request and the nature of the proposed amendment shall be advertised in the prescribed manner, and at any time within one month from its first advertisement any person may give notice at the Patent Office of opposition to the amendment.

(3.) Where such a notice is given the comptroller shall give notice of the opposition to the person making the request, and shall hear and decide the case.

(4.) Where no notice of opposition is given, or the person so giving notice of opposition does not appear, the comptroller shall determine whether and subject to what conditions, if any, the amendment ought to be allowed.

(5.) The decision of the comptroller in either case shall be subject to an appeal to the law officer, who shall, if required, hear the person making the request to amend and, where notice of opposition has been given, the person giving that notice, if he is, in the opinion of the law officer, entitled to be heard in opposition to the request, and, where there is no opposition, the comptroller, and may make an order determining whether and subject to what conditions (if any) the amendment ought to be allowed.

(6.) No amendment shall be allowed that would make the specification, as amended, claim an invention substantially larger than or substantially different from the invention claimed by the specification as it stood before the amendment.

(7.) Leave to amend shall be conclusive as to the right of the party to make the amendment allowed, except in case of fraud; and the amendment shall be advertised in the prescribed manner, and shall in all courts and for all purposes be deemed to form part of the specification.

(8.) This section shall not apply when and so long as any action for infringement or proceeding before the court for the revocation of a patent is pending.

22.—In any action for infringement of a patent or proceedings before a court for the revocation of a patent the court may by order allow the patentee to amend his specification by way of disclaimer in such manner, and subject to such terms as to costs, advertisement or otherwise, as the court may think fit:

Provided that no amendment shall be so allowed that would make the specification, as amended, claim an invention substantially larger than, or substantially different from, the invention claimed by the specification as it stood before the amendment, and where an application for such an order is made to the court notice of the application shall be given to the comptroller, and the comptroller shall have the right to appear and be heard, and shall appear if so directed by the court.

23.—Where an amendment of a specification by way of disclaimer, correction, or explanation, has been allowed under this Act, no damages shall be given in any action in respect of the use of the invention before the disclaimer, correction, or explanation, unless the patentee establishes to the satisfaction of the court that his original claim was framed in good faith and with reasonable skill and knowledge.

Compulsory Licences and Revocation.

24.—(1.) Any person interested may present a petition to the Board of Trade alleging that the reasonable requirements of the public with respect to a patented invention have not been satisfied, and praying for the grant of a compulsory licence, or, in the alternative, for the revocation of the patent.

(2.) The Board of Trade shall consider the petition, and if the parties do not come to an arrangement between themselves the Board of Trade, if satisfied that a *prima facie* case has been made out, shall refer the petition to the court, and, if the Board are not so satisfied, they may dismiss the petition.

(3.) Where any such petition is referred by the Board of Trade to the court, and it is proved to the satisfaction of the court that the reasonable requirements of the public with reference to the patented invention have not been satisfied, the patentee may be ordered by the court to grant licences on such

Digitized by Google

terms as the court may think just, or, if the court is of opinion that the reasonable requirements of the public will not be satisfied by the grant of licences, the patent may be revoked by order of the court.

Provided that an order of revocation shall not be made before the expiration of three years from the date of the patent, or if the patentee gives satisfactory reasons for his default.

(4.) On the hearing of any petition under this section the patentee and any person claiming an interest in the patent as exclusive licensee or otherwise, shall be made parties to the proceeding, and the law officer or such other counsel as he may appoint shall be entitled to appear and be heard.

(5.) For the purposes of this section the reasonable requirements of the public shall not be deemed to have been satisfied—

(*a*) if by reason of the default of the patentee to manufacture to an adequate extent, and supply on reasonable terms the patented article, or any parts thereof which are necessary for its efficient working, or to carry on the patented process to an adequate extent or to grant licences on reasonable terms, any existing trade or industry, or the establishment of any new trade or industry in the United Kingdom is unfairly prejudiced, or the demand for the patented article, or the article produced by the patented process is not reasonably met; or

(*b*) if any trade or industry in the United Kingdom is unfairly prejudiced by the conditions attached by the patentee before or after the passing of this Act to the purchase, hire, or use of the patented article, or to the using or working of the patented process.

(6.) An order of the court directing the grant of any licence under this section shall, without prejudice to any other method of enforcement, operate as if it were embodied in a deed granting a licence and made between the parties to the proceeding.

25.—(1.) Revocation of a patent may be obtained on petition to the court.

(2.) Every ground on which—

(*a*) a patent might, immediately before the first day of January, one thousand eight hundred and eighty-four, have been repealed by scire facias; or

(*b*) a patent may be revoked under this Act either by the comptroller or as an alternative to the grant of a compulsory licence;

shall be available by way of defence to an action of infringement and shall also be a ground of revocation under this section.

(3.) A petition for revocation of a patent may be presented—

(*a*) by the Attorney-General or any person authorised by him; or

(*b*) by any person alleging—

(i) that the patent was obtained in fraud of his rights, or of the rights of any person under or through whom he claims; or

(ii) that he, or any person under or through whom he claims, was the true inventor of any invention included in the claim of the patentee; or

(iii) that he, or any person under or through whom he claims an interest in any trade, business, or manufacture, has publicly manufactured, used, or sold, within this realm, before the date of the patent, anything claimed by the patentee as his invention.

26.—(1.) Any person who would have been entitled to oppose the grant of a patent, or is the successor in interest of a person who was so entitled, may, within two years from the date of the patent, in the prescribed manner apply to the comptroller for an order revoking the patent on any one or more of the grounds on which the grant of the patent might have been opposed.

Provided that when an action for infringement or proceedings for the revocation of the patent are pending in any court, an application under this section shall not be made except with the leave of the court.

(2.) The comptroller shall give notice of the application to the patentee, and after hearing the parties, if desirous of being heard, may make an order revoking the patent or requiring the specification relating thereto to be amended by disclaimer, correction, or explanation, or dismissing the application; but the comptroller shall not make an order revoking the patent unless the circumstances are such as would have justified him in refusing to grant the patent had the proceedings been proceedings in an opposition to the grant of a patent.

(3.) A patentee may at any time by giving notice in the prescribed manner to the comptroller offer to surrender his patent, and the comptroller may, if after giving notice of the offer and hearing all parties who desire to be heard he thinks fit, accept the offer, and thereupon make an order for the revocation of the patent.

(4.) Any decision of the comptroller under this section shall be subject to appeal to the court.

27.—(1.) At any time not less than four years after the date of a patent, and not less than one year after the passing of this Act, any person may apply to the comptroller for the revocation of the patent on the ground that the patented article or process is manufactured or carried on exclusively or mainly outside the United Kingdom.

(2.) The comptroller shall consider the application, and, if after enquiry he is satisfied that the allegations contained therein are correct, then, subject to the provisions of this section, and unless the patentee proves that the patented article or process is manufactured or carried on to an adequate extent in the United Kingdom, or gives satisfactory reasons why the article or process is not so manufactured or carried on, the comptroller may make an order revoking the patent either—

(*a*) forthwith; or

(*b*) after such reasonable interval as may be specified in the order, unless in the meantime it is shown to his satisfaction that the patented article or process is manufactured or carried on within the United Kingdom to an adequate extent:

Provided that no such order shall be made which is at variance with any treaty, convention, arrangement, or engagement with any foreign country or British possession.

(3.) If within the time limited in the order the patented article or process is not manufactured or carried on within the United Kingdom to an adequate extent, but the patentee gives satisfactory reasons why it is not so manufactured or carried on, the comptroller may extend the period mentioned in the previous order for such period not exceeding twelve months, as may be specified in the subsequent order.

(4.) Any decision of the comptroller under this section shall be subject to appeal to the court, and on any such appeal the law officer or such other counsel as he may appoint shall be entitled to appear and be heard.

Register of Patents.

28.—(1.) There shall be kept at the Patent Office a book called the register of patents, wherein shall be entered the names and addresses of grantees of patents, notifications of assignments and of transmissions of patents, of licences under patents, and of amendments, extensions, and revocations of patents, and such other matters affecting the validity or proprietorship of patents as may be prescribed.

(2.) The register of patents existing at the commencement of this Act shall be incorporated with and form part of the register of patents under this Act.

(3.) The register of patents shall be primâ facie evidence of any matters by this Act directed or authorised to be inserted therein.

(4.) Copies of deeds, licences, and any other documents affecting the proprietorship in any letters patent or in any licence thereunder, must be supplied to the comptroller in the prescribed manner for filing in the Patent Office.

(To be continued.)

Answers to Correspondents.

We cannot undertake to reply to correspondents through the post. Those of our readers who have addressed queries to us should look in this column for a reply.

C. and C. E.—You will notice that the article appears this week.

G. L. Co., Ltd.—The blocks have been duly returned, as requested.

N. C., L. C., and J. C.—Thanks for information respecting carbonate of ammonia shipments.

B. and W., Ltd.—We hope to write you direct in the course of a few posts in reply to your query.

F. W. A.—We are greatly obliged by your letter of the 24th ult., and shall be glad to receive the blocks as promised.

A. W. and Sons.—We do not know of any published list of coke ovens in the United Kingdom. You might repeat the query to the Editor of *The Iron and Coal Trades Review*.

A. R.—The firm who formerly supplied this pulveriser have now gone out of the business, and we cannot say where you could obtain one of the machines. You might advertise in the *Journal*.

Analytical Notes.

THE ARSENATE PROCESS FOR THE SEPARATION OF MAGNESIUM AND THE ALKALIS.

BY PHILIP E. BROWNING AND W. A. DRUSHEL.

Among the methods which have been employed for the separation of magnesium from the alkalis the following are perhaps in most general use :—

The barium hydroxide method, whereby the magnesium is precipitated as the hydroxide by barium hydroxide.

The mercuric oxide method, whereby the magnesia is precipitated by freshly prepared mercuric oxide acting upon the chlorides.

The ammonium carbonate method, whereby the magnesium is precipitated as the double carbonate of magnesium and ammonium by a large excess of ammonium carbonate (Wulfing, *Ber.*, xxxii., 2214).

The amyl alcohol method, whereby the magnesium chloride is dissolved in boiling amyl alcohol and the chlorides of sodium and potassium, not lithium, remain undissolved (Riggs, *Am. Journ. Sci.* [3], xliv., 103).

None of these methods, when employed with a view to the subsequent estimation of the alkalis, is free from objectionable features, such as difficulties of filtration, numerous transfers of filtrates, introduction of large amounts of reagents difficult of removal, and incomplete separation of the entire alkali group.

The work to be described is an effort to avoid some of the objections mentioned, by the precipitation of magnesium as the magnesium ammonium arsenate, and the removal of the arsenate from the filtrate by reduction and volatilisation of the arsenic salt. C. v. Hauer (*Jahrb. der k. k. Geolog. Reichanstalt*, iv., 863) suggested this general procedure, and it has found other mention in the literature (Fresenius-Cohn, "Quant. Anal.," 6th ed., vol. i., 613). The removal of the excess of arsenic was accomplished by ignition of the residue, obtained after evaporating the filtrate from the ammonium magnesium arsenate, with ammonium chloride. The method, however, has been criticised as inaccurate for the estimation of magnesium, and tedious. Recent work upon the precipitation of magnesium ammonium arsenate and upon the volatilisation of arsenic compounds suggested the possibility of obviating the difficulties which have kept this method from general use.

It is possible, with careful manipulation, to remove the arsenic by precipitating with hydrogen sulphide, but this procedure required an additional filtration and several transfers of liquid, and was therefore abandoned in favour of the separation by volatilisation.

The reagents used in this work were prepared as follows: The potassium chloride by igniting pure potassium chlorate and crystallising; the sodium chloride by re-crystallising the so-called pure sodium chloride. Solutions of these salts were made approximately tenth normal and standardised by evaporating measured portions with sulphuric acid in a weighed platinum crucible, and weighing the residues after ignition at the full heat of a Bunsen burner, as the normal sulphates.

A solution of magnesium chloride was obtained by dissolving a weighed amount of pure magnesium in hydrochloric acid and diluting sufficiently to make the solution approximately tenth normal. The solution was standardised by estimating the magnesium in measured portions as the pyroarsenate.

To obtain ammonium arsenate, arsenious oxide was sublimed and oxidised by an access of nitric acid. After the completion of the oxidation, the excess of nitric acid was removed by evaporation, the residue treated with a slight excess of ammonium hydroxide, and the solution thus obtained diluted sufficiently to make it approximately fifth normal.

From a mixture of known amounts of standardised solutions of the chlorides of magnesium and potassium or sodium, the magnesium was precipitated in a distinctly but not strongly ammoniacal solution by 40% to 80% excess of ammonium arsenate, with brisk stirring. When only a small amount of magnesium is present in a relatively large amount of solution, the precipitate forms slowly and becomes complete only on long standing. In a previous paper from the Kent Chemical Laboratory of Yale University (Gooch and M. A. Phelps, *Am. Journ. Sci.*, 1906, xxi., 488), it has been shown that the precipitation of amounts of arsenic so small as not to be precipitated immediately by magnesium mixture may be brought about by freezing the solution after adding that reagent, and remains complete when melting takes place. This procedure was found equally applicable in the precipitation of magnesium. A similar result was obtained by adding alcohol amounting to 15% to 20% of the mixture, and filtering as soon as the precipitate settled completely. The precipitate was collected under moderate pressure in an ignited and weighed perforated crucible containing a close felt of fine asbestos. It was washed with 40 to 50 cc. of ammoniacal water after which it was dried at 125° C. to 140° C. and carefully ignited and weighed as magnesium pyroarsenate.

In a previous paper from the same laboratory, it has been shown that arsenic may be removed by distillation with potassium bromide and hydrochloric acid in a distilling apparatus (Gooch and I. K. Phelps, *Am. Journ. Sci.*, 894, xlviii., 216). This suggested a method for the removal of the arsenic from the filtrate obtained after separating the magnesium ammonium arsenate. In some preliminary qualitative experiments, solutions containing from 0.1 to 0.2 grm. of ammonium arsenate were treated with 10 cc. of hydrochloric acid (sp. gr. 1.20) and 10 cc. of hydrobromic acid (sp. gr. 1.36), or 1 to 3 grms. of ammonium bromide, and evaporated in an open dish and the residues were ignited until fuming ceased. One such treatment was usually found to be sufficient; in fact, simple evaporation on a steam bath with the mixed acids, or with hydrobromic acid (not with hydrochloric acid alone), proved to be sufficient to remove the arsenic. Similar treatments made in the presence of definite amounts of the sodium or potassium chloride gave the results shown in Table I.

Some evaporations made with hydrochloric acid and sulphurous acid resulted in the removal of the arsenic, but three to five repetitions of the process were generally necessary.

The complete method as recommended for the estimation of magnesium and its removal from the alkalis, and the subsequent estimation of the alkalis, is as follows :—

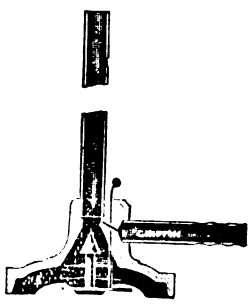
The magnesium is precipitated in a distinctly but not strongly ammoniacal solution by a 40% to 80% excess of ammonium arsenate. The completeness of the precipitation may be hastened by freezing the solution in an ice and salt mixture or by adding alcohol to about 15% to 20% of the total volume of the solution, which may vary from 100 cc. to 250 cc. according to the amounts of salt present. The magnesium arsenate obtained is filtered on an asbestos felt contained in a perforated platinum crucible, the crucible and felt having been previously ignited and weighed, and is dried, ignited, and weighed as the pyroarsenate.

The filtrate is transferred from the filter flask to a platinum dish, and after the addition of 10 cc. of hydrochloric acid (sp. gr. 1.20) and about the same amount of hydrobromic acid (sp. gr. 1.3), or 1 to 3 grms. of ammonium bromide evaporated to dryness under a draught-hood, the residue is gently ignited to remove the ammonium salts. The residue is then transferred to a weighed platinum crucible with a small amount of water, a little sulphuric acid (1 : 1) added, and the solution evaporated to remove the water and excess of sulphuric acid, by placing the crucible on a triangle in a porcelain crucible used as a radiator. After the sulphuric acid has ceased to fume, the crucible is removed from the radiator, and after ignition at the full heat of the Bunsen burner the alkali is weighed as the normal sulphate. The results are given in Table II.

In experiments 1 to 10, the precipitate of magnesium was allowed twelve to twenty-four hours to settle. In experiments 11, 12, and 13, 15% alcohol was used to hasten the complete precipitation of the magnesium, and in experiments 14, 15, and 16 the salt and ice mixture was used for the same purpose.—*American Journal of Science.*

A NEW BUNSEN BURNER.

We have received from Messrs. John J. Griffin & Sons one of their new "Teclu" bunsen burners for laboratory use. The illustration at the side clearly shows the special features embodied, which are (1) that as the gas jet is at the side of the bunsen tube it is thereby unaffected by drips; and (2) the air adjustment permits the temperature of the flame to be instantly varied. We have given this burner a trial in our laboratory, and find that it bears out all that Messrs. Griffin claim for it. It is free from the very objectionable "striking back" when turned low, the air adjustment is very easily made, and an extremely high temperature is obtainable. We can confidently recommend the burner as being one of the best on the market, and its good points, together with its low price (1s. 6d.) should ensure its being very popular.



Cement in Russia.—The Opotchno Cement Factory (Radom) closed its seventh (1906) working year with a loss of £2,277.

Bursting of a Gas Holder.—Considerable damage to neighbouring property was caused last week by the bursting of a gas holder in the goods yard of the Great Central Railway Company at Ardwick, Manchester. The holder, which was nearly new, was used for supplying the railway carriages with gas. It burst with sufficient force to lift the roof off an adjoining school, and to shatter the windows of many shops and houses within a mile. A workman in the yard was badly burnt, but no other personal injury is reported.

University Grants.—The Manchester Education Committee have adopted a resolution expressing regret at the proposed reduction of the grant from the Treasury to the Manchester University. The opinion was expressed by many members of the Committee that by this decision Manchester would be unfairly treated, as a smaller sum was allocated to its University in proportion to its size, and the character of the work which it is doing, than to any other university or university college in the Kingdom.

Continental Notes.

In the *Zeitschrift für Chemische Apparatenkunde* for September 15, A. Dosch concludes his series of articles on plant for controlling the combustion process in steam boilers. In this section he describes the construction of a "gas analysor" which is capable of giving absolutely continuous readings. In the one which was alluded to before in these *Notes* a long tube was filled with the flue gas, and the weight of the column of gas was ascertained by means of a manometer. In the apparatus now described there are two long vertical tubes, which are joined together at their upper extremities and there connected to a suction apparatus. One of these tubes is connected through a cock with the flue, and the other with the open air. The lower ends are also connected with the two ends of a delicate differential manometer, which gives the difference of pressure due to the difference of weight of the two columns. The plant can be made self-registering by attaching a photographing arrangement, which gives the position of the liquid in the manometer at any time.

The same issue contains a description of a plant for the automatic control and regulation of fractional distillation. This acts upon the principle that a hydrometer, which is immersed in the distillate flowing from the still, rises as the specific gravity increases, and when it reaches a certain point makes an electric contact, which may give an optical or acoustical signal, or may be made to operate various cocks by means of electro-magnets and so turn the distillate into the proper vessel. Some details are given of an arrangement of this kind.

In the issues of the same journal for October 1 and 15 there are instalments of a paper by Jakob, on the determination of the heating power of coal by means of the calorimeter. Special attention is paid to the calculations and corrections necessary in order to obtain an accurate result. The first section deals with the "upper and lower calorific values." The upper value is that obtained directly in the calorimeter, where the greater part of the water is condensed to the liquid state in consequence of the low temperature. The lower calorific values are calculated from this by taking into account the heat that has been given out by the condensation of the water and its cooling from 100° C. to the temperature of the calorimeter, and also the heat set free by cooling the carbon dioxide through the same range. In the second section the standardisation of the calorimeter is discussed, and also the determination of its water value. This can be done by three different methods. It can be calculated from the known weights and the specific heats of the constituent parts of the calorimeter, or it can be determined by the method of mixtures, by adding a quantity of warm water to the cold water in the outer vessel of the calorimeter, or, finally, it can be determined by burning known quantities of various organic compounds the calorific values of which are known. The author obtained very different figures for his calorific values by these three different methods, and also found different water values for the calorimeter according to the quantity of water used in the method of mixtures, or the quantity of the combustible compound used in the combustion method. The variations follow a definite law, however, and are of course dependent on the peculiarities of construction of the calorimeter and the method of using it. The author places reliance only on the results obtained by the combustion method. There must, however, always be a sufficient excess of oxygen present to ensure complete combustion. A different water value must be used according to the rise of temperature that is observed in the calorimeter during a determination. The third section deals with the corrections that must be applied in consequence of the use of igniting material for setting the charge off, for the radiation of heat that takes place during the experiment, and for the combustion of the sulphur and nitrogen in the coal sulphuric and nitric acids.

Electrolytic Copper in Russia.—A group of copper smelters is organising a syndicate under the style of "Electrolyse" for the purpose of erecting an electrolytic factory. The Russian demand for electrolytic copper ranges between 400,000 to 500,000 poods a year, and for bar copper between 1,000,000 to 1,100,000 poods, but the home production of the article is very small indeed. The present idea is to erect a well-equipped central factory, in all probability in Moscow. The question of carriage to and from the factory will be a serious one, and the promoters of the new concern are agitating for favourable rates.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in the Manufacture of Explosives. G. Cornaro, Via San Quintino, Turin, Italy. British Patent, 9,170. Date claimed under International Convention, April 21, 1906.

The inventor has ascertained, by means of experiments, that several common metals have, under certain physical conditions, the property of becoming oxidised with so much violence, and with the development of so much thermal energy, that they constitute explosives of great power. The physical state required for this purpose is that of very fine division, obtained by means of mechanical pulverisation, or preferably by the electrolysis of the oxides or salts of the metals. He has also ascertained that very much greater explosive force is obtained by using a mixture of different metals than by using the metals singly, if the mixture is an intimate one and consists of suitable proportions of two or more metals which begin to oxidise at different temperatures, and the successively formed oxygen compounds of which develop, during their formation, increasing quantities of heat, so that the oxidation of one of them induces, by the heat developed, the more rapid and complete oxidation of the other metal or metals, of which the oxidation takes place at a higher temperature.

It is claimed that this process allows of obtaining explosive forces considerably greater than those obtained by means of the most powerful nitrogen-compounds. Aluminium and antimony used singly constitute powerful explosives when mixed with an oxide or highly oxidised salt which is stable at ordinary temperatures, but is adapted, when its temperature is raised by ignition, to yield the oxygen required for the combustion of the metal, as, for example, manganese dioxide, chlorates, and nitrates. If, however, aluminium and antimony are mixed with each other in suitable proportions, together with a suitable quantity of oxide or highly oxidised salt, the oxidation of one of the metals develops heat by which the oxidation of the other metal is caused to take place with more completeness and with the development of a greater amount of heat, and consequently of explosive force. During the first phase of the explosion there is produced oxide of antimony Sb_2O_3, the heat of formation of which assists and accelerates the formation of aluminium oxide Al_2O_3. The heat of formation of the latter, added to that of the antimony oxide, raises the temperature to the temperature at which antimonious anhydride Sb_2O_5 is formed, and this compound in turn raises the temperature to that at which a peroxide of aluminium is formed, which may be the hitherto unobtainable anhydride Al_2O_5. The patentee observes that the unknown heat of molecular constitution of this peroxide must be exceedingly great, since the explosive produced in the manner described explodes with a force approximately nine times as great as that of the best black powder—that is to say, twice as great as that of the most powerful nitrogen compounds known. This high explosive force cannot be due to the heat of formation of the aluminium oxide and antimonious anhydride, and can only be explained by assuming the formation of aluminium anhydride, with the enormous development of heat due thereto.

It is necessary that the explosion of an explosive of this nature should take place in a projectile, mine, torpedo, or the like, to prevent the expansion and cooling of the gases in course of formation. If the metallic explosives manufactured by the process described are formed with nitrate of potash, explosion does not take place below a temperature of approximately 300° Centigrade, and is not readily produced by the action of impact or friction.

By altering the proportions of the metals mixed with each other, different explosive forces are obtained, according to the purpose for which the explosive is required. At the very high temperatures of explosion the oxides and metallic anhydrides are gaseous, but immediately after the explosion and consequent expansion and cooling of the gases, the latter rapidly become condensed and solidified, but remain in a state of fine division, so that they remain suspended in the atmosphere and form a thick and slowly dispersing smoke, visible at a considerable distance.

Improvements in Power Gas Producers. Mason's Gas Power Co., Ltd., of Alma Works, Levenshulme, Manchester, A. Hollis, 24, Beech Range, Levenshulme, and T. Wright, 39, Cringle-road, Levenshulme. British Patent, 20,484. September 15, 1906.

In certain known constructions of power gas producers (usually of rectangular formation) it is customary to provide them with inner depending walls reaching down to a point below the level of the fuel, and providing passages for the escape of the gas. The objections to this construction are, first, that at those points of the furnace immediately below the inner walls, the fuel is inaccessible for pokering; secondly, that, unless great care is taken, the poker is liable to break or damage the lower edges of the walls; and thirdly, a large portion of the interior of the producer is not used to the best advantage.

The present invention has for its object to provide a gas producer (preferably of circular formation) in which the inner walls are dispensed with, and in which the passage for the gas is exterior (instead of interior) to the producer, thus leaving the interior plain and accessible at all points for pokering, as

Digitized by Google

well as enabling the producer to be used to the fullest advantage. The invention also has for its object to provide a producer in which the gas will pass into the gas outlet through a series of openings extending all round the producer, and in which any vapour or unfixed gas will have of necessity to pass through the burning fuel before it can reach the openings. The original specification should be consulted.

Improvements in the Manufacture of Producer Gas and in Generators therefor. J. E. Dowson, of 39, Victoria Street, Westminster, London. British Patent, 21,258. September 25th, 1906.

The objects of this invention are to facilitate the production of gas, and to prevent an accumulation of troublesome lime and other deposits in the gas generator. The type of gas generator used is that in which steam and air are employed to make combustible gas suitable for heating purposes or for working gas engines. The gas generator can be of the suction or pressure type. For producing gas of this kind it is usual to have a vaporiser in the gas generator to produce the steam required, or to have steam from a vaporiser outside the generator, or from an independent boiler. In the present invention the vaporiser or boiler is dispensed with entirely, and atomised water (by which term I imply water in a very fine state of division) accompanied by a small proportion of the air used for the purpose of combustion is passed directly into the fire in the gas generator, and the water is there converted into steam and afterwards decomposed. When the gas plant is used in conjunction with a gas engine, some of the burnt gas from the cylinder or exhaust of the latter may be used instead of a portion of the air before mentioned. The original specification should be consulted.

Improved Process for the Manufacture of Hydrocyanic Acid and its Salts R. S. Hutton, of the University of Manchester and E. W. Smith, Ivy House, Mottram, Cheshire. British Patent, 23,835. October 26, 1906

The inventor claims :—A process for the production of hydrocyanic acid, which consists in passing a current of a mixture of gases containing hydrogen and nitrogen over the surface or through a mass of carbon maintained at a temperature of at least 1700° C., but considerably below the temperature of the positive crater of the electric arc, the hydrocyanic acid thus produced being subsequently absorbed or utilised according to any of its known reactions, and the residual or uncombined gases being utilised, if desired, by being brought again into contact with the heated carbon, or for other purposes.

An Improved Method or Process of Producing Pure Hydrogen. Dr. A Frank, 26, Berlinerstrasse, Charlottenburg, Germany. British Patent, 26,808 Novemb er 26, 1906.

The present invention has for its object a method of producing pure hydrogen from water-gas.

Water-gas obtained on a large scale contains a quantity of hydrogen and carbon monoxide, besides some carbonic acid and nitrogen, and small quantities of heavy and saturated hydrocarbons. In processes heretofore known the carbonic acid has been removed from water-gas by absorbing the carbonic acid by passing the gases through, for example, water, lime, carbonate of soda, or acetate of lead. In other processes, the carbon monoxide is absorbed by a cuprous chloride solution which can be regenerated by subjecting it to a vacuum with recovery of carbon monoxide. According to the present invention the compounds which are present in water-gas in addition to hydrogen are absorbed in one or two operations following one after another, with the result that almost chemically pure hydrogen is obtained as the final product.

For this purpose, water-gas which is previously dried as much as possible is conducted over calcium carbide, at a temperature of over 300° C. The calcium carbide may be pure or be mixed with other carbides, or with inert materials (such as carbonates, halogenides and sulphates), which promote the absorption, or with such as reduce the temperature of absorption. When water-gas is conducted over carbide thus heated, absorption of all the gases intermixed with the hydrogen takes place. Carbon monoxide and carbonic acid, in reacting with the carbide, form lime and carbonate of lime and carbon. The nitrogen is likewise absorbed. The heavy or saturated hydrocarbons are decomposed with the separation of carbon when passed over the heated material containing lime and carbon. Almost chemically pure hydrogen is ultimately obtained as the final product.

In a modification of the process, carbonic acid and carbon monoxide are previously entirely or partially removed from the water-gas by means of suitable absorption media, such as lime or cuprous chloride solution (acid, neutral or alkaline), in order to relieve the carbide, and thus a mixture which is rich in hydrogen is in the first place produced, and is afterwards submitted to the action of carbide in the manner above described.

When working in this manner, the regeneration of the cuprous chloride solution can be effected by this being subjected, after saturation with carbon monoxide, to the action of a vacuum. In this manner, the carbon monoxide dissolved in the cuprous chloride solution is removed from the same at ordinary temperatures, and may be obtained separately in a pure condition, whereas the cuprous chloride solution can be used again in the process.

Improvements in and relating to Crushing Machines. T. L. Sturtevant and T. J. Sturtevant, both of Harrison-square, Boston, Mass, and the Sturtevant Mill Co., Boston, Mass., U.S.A. British Patent 13,192. June 6, 1907.

The inventor claims :—(1.) A rocking-jaw crushing-machine, the frame of which comprises relatively thin side-plates, with or without an intermediate plate or plates, and a rear cross-beam provided with flanges by which it is bolted to said plates, and in which rear cross-beam the driving shaft for operating the rocking-jaw or jaws is journalled, so that the said rear cross-beam, instead of the said plates, will directly receive the strain of the said shaft. (2.) A rocking-jaw crushing-machine, the frame of which comprises relatively thin side-plates, with or without an intermediate plate or plates, and a rear cross-beam overhanging said side plates and provided with flanges by which it is bolted to said plates, and in which rear cross-beam the driving shaft for operating the rocking-jaw or jaws is journalled, so that the said rear cross-beam, instead of the said plates, will directly receive the strain of the said shaft. (3.) A crushing-machine frame consisting of relatively thin side-plates and an intermediate plate or plates, a sectional head-block or front cross-beam rigidly attached to said plates, and a sectional rear cross-beam having flanges arranged within said side-plates and firmly bolted thereto and to said intermediate plate or plates so as to brace the said plates, the crushing-machine comprising a driving shaft, the bearings of which are supported by said rear cross-beam, and rocking-jaws operated from said driving shaft.

Method of Producing Oxide of Nitrogen by Means of Explosions. Dr. F. Hausser, 38, Mozartstrasse, Kaiserslautern, Bavaria. British Patent No. 13,989. June 17, 1907.

The present invention relates to the production of oxides of nitrogen and particularly to the process of producing oxides of nitrogen described in Letters Patent No. 12,401, of 1906. According to that process the gases expand and drive the piston forward, thus performing work ; and are so considerably cooled that they can no longer be used, say, for concentrating the obtained nitric acid or nitric salts. Many experiments have been made with gas motors to devise means for further utilising the exhaust gases for heating purposes, but without any practical success, as these gases after having been exhausted are no longer hot enough. It is, however, advantageous when producing nitric acid to utilise the generated heat for concentrating the acid or the nitric salts. This may be attained by allowing the gases to exhaust directly after the explosion, foregoing the gain of their work, through the outlet valve, whereby they keep hot enough for concentration purposes. Immediately after the exhaust the engine draws in again further mixture, therefore working on the two-stroke cycle so that one explosion occurs with each crank revolution. This process, however, would result in a rapid wearing away of the outlet valve, as with each revolution of the engine the outlet valve would be exposed to the action of the highly heated high pressure exhaust gases. This disadvantage is overcome, if the engine, which works then as a simple compressor, conveys the explosive gaseous mixture into an explosion vessel or " shell," which is made so large that the desired compression pressure is only attained after several crank revolutions of the compressor. The number of explosions may thereby be much smaller than the number of revolutions of the compressor, so that the outlet valve of the " shell," or explosion vessel, need not be opened so frequently, and is thereby spared ,while the outlet valve of the compressor has only to stand the temperature of compression.

Gold Bearing Ores in the United Kingdom.—The reported discoveries of gold-bearing conglomerates in the Wye Valley are interesting, but whether they will "pay out" is a question. Articles have appeared recently in this *Journal* as to the Chaston Gold Syndicate discoveries, the writer questioning the statements as to the age and form of deposition. The Wye Valley Syndicate state the conglomerate as the source of deposition, or it may be assumed that the ore is found (not visible) in the drift and gravel. In both ice ages gold has been found in the "drift," but not in payable quantities within the United Kingdom. It, however, does not by any means follow that with approved appliances the conglomerates and gravels hitherto disregarded may yield payable gold, and in the neighbourhood of "contact" veins, it is at least not unreasonable, in the Wye Valley, to expect to find gold in the reef, and also in the conglomerate and gravel.

Reports of Companies.

ELECTROLYTIC ALKALI CO., LTD.

The report for the year to August 31 states that the net profit, after allowing for depreciation, mortgage debenture interest, and expenditure on renewals, repairs and general upkeep of buildings, plant, machinery, tools, etc., is £8,212., to which is to be added the amount brought forward from last year, namely, £2,127., making a total of £10,339. The directors regret that the hope expressed in the last annual report, that further developments during the ensuing year would show better results, has not been realised. They observe that it will be obvious to all who are familiar with manufacturing operations that the causes of this result have been entirely beyond the control of the board, the further increase during the year in the price of fuel, packages and other commodities which form the chief items of cost of the company's manufactures being mainly responsible for the decreased profit. Notwithstanding the result now shown, the directors have the fullest confidence that, when normal prices have been re-established, the company will be able to make a satisfactory return to all the shareholders. Two and a half years' dividend on the preference capital has now accrued, but, in view of the unsettled state in that portion of the chemical trade in which the company is engaged, the directors think the wisest course is to pay only one half-year's dividend upon such shares, which will absorb £3,498., leaving a balance of £6,840. to be carried forward to the next account, and they recommend that this be done.

DIVIDENDS.

Alianza Co., Ltd.—An interim dividend of 7%, free of income-tax, will be paid on November 4 next.

Anglo-Chilian Nitrate and Railway Co.—The directors have resolved to pay interim dividends on account of the year 1907 of 5s. per £5. preference share and 5s. per £5. ordinary share, both free of income-tax.

Books Received.

Steel Works Analysis. By J. O. Arnold and F. Ibbotson. Third edition, thoroughly revised and enlarged. Pp. 462. London: Whittaker and Co. 10s. 6d. net.

The Metric and British Systems of Weights, Measures, and Coinage. By F. Mollwo Perkin, Ph.D. Pp. 83, with 17 diagrams. London: Whittaker and Co. 1s. 6d. net.

The Bank Rate.—On Thursday last the Bank Rate was advanced to 5%, having been 4% since August 15.

Bank Amalgamation.—The amalgamation of the Lancaster Banking Company, Ltd., and the Manchester and Liverpool District Banking Company, Ltd., is announced.

Official Chemical Appointments.—The second edition of the "List of Official Chemical Appointments" is now in course of preparation with a view to publication early in 1908. Fellows and Associates of the Institute of Chemistry, particularly those who hold official positions, are reminded that suggestions which may increase the usefulness of the list will be welcomed and carefully considered. All communications should be addressed to the Registrar, Institute of Chemistry, 30, Bloomsbury-square, London, W.C.

Guano Concessions in Mexico.—A notice recently appeared in the *Board of Trade Journal* respecting the granting of a concession for the exploitation of guano upon certain islands in the Gulf of Mexico. The Mexican *Diario Oficial* of September 21 published the text of a further concession granted by the Mexican Government to Mr. Aurelio Cadena y Marin for the exploitation of the guano deposits on the Islands of Aguada or Puerto Real, Cayo Chelem, Sabanquy, Holbox, Sisal, Xamachtun, Tecchal, Temalcab, and Triàngulos y Blanca in the Gulf of Mexico. The contract is for a period of ten years, reckoning from the date of publication, and the Concessionaire engages to pay to the Mexican Government the sum of 75 cents for each ton of guano extracted, as well as the export duties. The *Diario* of October 7 contains a copy of a contract made with Mr. Harry J. Earle for exploiting guano in the islands of Contoy, Cancun, Cayo Arenas, Chinchorro and Alacranes, off the East coast of Yucatan.

RETORT CARBON.

(To the Editor of the Chemical Trade Journal.)

Sir,—As subscribers to your *Journal* we should be glad if you or any of your readers could give us any information on the following subject, through your correspondence column.

We wish to find out the best means of getting in touch with the Continental buyers of retort carbon for electrical purposes.—Yours, etc., A.A.

WOOD ALCOHOL.

(To the Editor of the Chemical Trade Journal.)

Sir,—If you or your readers could supply the following information through the *Chemical Trade Journal* we should feel greatly obliged :—

(1.) The quantity of wood alcohol produced in the United States yearly.

(2.) The quantity used for denaturing alcohol in the United States yearly.

(3.) The present market price of wood alcohol in the United States.

When the present price of wood alcohol in this country is only 1s. 10d. per imperial gallon it seems remarkable that the United States can ship such large quantities and sell it at such a low price. What is the explanation ?—Yours, etc.,

P.C.L.

NEW YORK PRICES CURRENT.

Oct. 15, 1907.

Prepared for this Journal by Messrs. Stanley Jordan and Co., 100, William-street, New York.

(The values are at ship's side, usual ports, unless otherwise stated.)

Market Reports.

THE AMERICAN CHEMICAL MARKET.

NEW YORK, October 15, 1907.

(Rate of Exchange, $4.86 = £1.)

Nitrate of soda is steady but dull, at $2.40. to $2.45. per 100 lbs., for spot shipments. Sulphate of ammonia is slow of sale, at $3.5. per 100 lbs. Grey muriate is in somewhat less demand, at 6c. to 6¼c. per lb., as to make. White muriate for galvanising purposes is depressed, owing to large stocks, and is offered at 5⅝c. to 6c. per lb. Lump carbonate of ammonia is steady at 7⅛c. to 8c. per lb., and powdered nominally 1c. per lb. higher. Lump sal ammoniac is unchanged at 9¼c. per lb. Bleaching powders are moving on contract as usual at $1.20 to $1.30. as to make. Alkali is unchanged, at 92½c. per 100 lbs. for light 58%, in bags, f.o.r. makers works; and caustic soda, 74%, is $2.05. per 100 lbs. Sulphate of copper has been reduced by the syndicate to 5½c. per lb., which price might be shaded a trifle. White powdered arsenic is very dull, and is easy at 6⅞c. per lb., while red Saxony arsenic is firm at 7½c. per lb. Carbonate of potash, calcined 80-85%, is 3¾c. per lb., and hydrated 4¼c. per lb. Caustic potash, 75%, 4½c. per lb. Chlorate soda 8¼c. per lb., and potash 8¼c. per lb. for crystals and 9c. per lb. for powdered, f.o.r., maker's works. Prussiate of soda is 9¼c. per lb., and potash dull at 16¾c. per lb. Bichromate of soda is 7¼c. per lb., and potash 7⅞c. per lb., both under syndicate control. Antimony products are again down, and oxide is freely offered at 11c. per lb. Oxalic acid is somewhat weaker, and spot lots have changed hands at 8c. per lb., while a little less could probably be done for shipments.

THE RUSSIAN CHEMICAL MARKETS.

The Warsaw chemical report of October 17 speaks of an uneventful market for the preceding fortnight. The prices for heavy chemicals were as follows :—Nitric acid, 36° B., 3 roubles 50 copecks ; borax crystals, 4r. 90c. ; white lead, 5r. 80c. ; wood spirit, 95-96%, 10r. 50c. ; chloride of lime, 1r. 50c. ; sulphate of copper, 7r. 35c. ; salammoniac (lump), 9r. 25c. ; potash (Saratoff), 3r. 15c. ; Chili saltpetre, 2r. 18c. ; Russian turpentine, 4r. 25c. ; ammonia soda, 1r. 50c. ; caustic soda, 3r. 20c. ; commercial muriatic acid, 76c. ; superphosphate, 12-13%, 52c. ; red lead, 5r. 90c. ; sulphuric acid, 66° B., 1r. 2c.

Odessa reports dated October 23 continue to speak of considerable dealings in disinfectants, in view of the spread of the cholera epidemic. In other directions, however, business is quiet, though prices remain firm. Ammonia in casks is quoted 7 roubles 20 copecks ; white lead, 6r. to 6r. 10c. ; glycerine, 11r. 50c. ; wood spirit, 96°, 7r. 10c. ; chloride of lime, 1r. 80-95c. ; yellow potash, 14r. 50c. to 15r. 25c. ; sulphate of copper, 6r. 50-70c. ; salammoniac, 8r. 10c. ; Caucasian potash, 2r. 50-55c. ; Chili saltpetre, 2r. 10-15c. ; caustic soda, 2r. 75c. ; calcined soda, 1r. 40c. ; muriatic acid (commercial), 1r. 5c. ; lemon salt, 41r. 50c. to 42r. ; Russian turpentine, 3r. 25c. ; bichromate of potash, 9r. ; ether, 8r. 50-75c. All per pood of 36lbs.

TAR AND AMMONIA PRODUCTS.

Friday.

Benzols quiet, with quotations given at 8¾d. to 9d. for 90's, and 9d. for 50-90's, casks included. Crude tar, 15s. to 19s. per ton, Thames ; 1⅞d. per gallon delivered. Refined tar, 12s. per barrel ; Gas Company, 12s. 6d. Pitch, 24s. 3d. to 24s. 9d., f.o.b. ; Gas Company, 26s. 6d. ; East Coast, 24s. to 24s. 6d. ; West Coast, 23s. to 24s. Refined naphthalene, £8. 10s. to £8. 10s., packages included. Toluol, 90%, 10d. to 10½d. ; pure, 1s. 1d., casks included. Carbolic acid, crude, 50%, 1s. 5d. to 1s. 5½d. ; 60%, 1s. 7¾d. to 1s. 8d. ; 75%, 1s. 11¾d., casks included. Crystals 39-40, 5¼d. ; 34-35, 4⅞d. to 5d. Cresylic, 95%, 1s. 1d. to 1s. 1¼d. Anthracene, 40 to 45 per cent A, 1¾d., casks included. Pyridin, 4s. to 4s. 3d. Sulphate of ammonia firm, and with a good tone reported. Nearest values are :—Beckton, October-December, £12. 5s. ; January-April, £12. 7s. 6d. ; Beckton terms, £12. ; London, £11. 17s. 6d. ; Hull, £11. 18s. 9d. ; Liverpool, £12. ; Manchester, £11. 17s. 6d. ; and Leith, £12. 5s. ; forward, £12. 7s. 6d.

Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 9d. ; Liverpool, ordinary, 11s. 2½d., and refined, 11s. 3d. Official quotations :—Cargoes, off coast or due, 10s. 10½d. ; ditto for prompt shipment, 11s. 2d.

Digitized by Google

THE LONDON METAL MARKETS.

THURSDAY.

Copper: Standard brands, £62. 12s. 6d. to £62. 17s. 6d. cash, and £62. to £62. 5s. three months. Tin: G.M. quality, £145. to £145. 10s. cash, and £146. 5s. to £146. 15s. three months; English, £147. Lead: Soft foreign, October, £18. 5s.; November, £18. 2s. 6d.; January, £17. 15s.; English, £18. 10s. to £18. 15s. Spelter: Ordinary brands, November, £22.; January, £21. 17s. 6d., ex ship; hard, £18. 10s. to £19., f.o.b. Antimony, £41. to £43.; ore, £13. Bismuth, 6s. 6d. Quicksilver, £8. 5s.; seconds, £8. 3s. 9d. Nickel, 1s. 10d. per lb. Pig-iron closing prices: Cleveland, 53s. cash; 52s. 3d. one month; 51s. three months.

FERTILISER MATERIALS.

THURSDAY.

Demand has been sustained throughout the week for ammoniacal material, and prices have slightly advanced.

Nitrate of soda remains steady on spot, at 11s. 3d. per cwt., for 95%, and 11s. 6d. per cwt. for refined quality, ex store.

East Indian bone meal, for shipment, is rather neglected. Nearest quotation is £4. 17s. 6d. per ton, nett, c.i.f. terms Liverpool, 4½ and 52% quality. On spot, £5. 5s. to £5. 10s. per ton, according to quality, ex store, is required.

Mineral phosphates of all grades still maintain a strong position.

MISCELLANEOUS CHEMICAL MARKET.

FRIDAY.

The demand for heavy chemicals is fairly satisfactory, both for home and export, and values all round are well maintained. Caustic soda is firm at the recent advance. Bleaching powder, softwoods, is steady on the spot, at £4. 7s. 6d., free on rails; for 1908 contracts, £4., f.o.r., is still quoted. Soda crystals dearer, at 57s. on rails, makers' works. Ammonia alkali and bicarbonate of soda are unaltered. Recovered sulphur, £4. 12s. 6d., f.o.r. Some small contracts for saltcake have beeen concluded for next year at the advanced price of 42s. 6d., but, generally, demand is not very brisk. Quotations for sulphate of copper are rather unsettled for forward delivery, owing to the fluctuations of the metal market; prompt price is £24. per ton, f.o.b. Liverpool. White powdered arsenic is rather quiet just now, and prices are easier at £29. 10s. to £30. per ton. Prussiates have an upward tendency, potash now being quoted at 6d. per lb., and soda 3¾d. per lb. Quotations for potash, caustic and carbonate, are still at a high level owing to short supplies. Lead salts are a turn weaker; foreign white, at £31., ex ship; brown, £26. per ton. Crude glycerine is scarce and dear. Crystal carbolic acid dull, at 5¼d. for 39-40; crude, 60's, 1s. 8d. per gallon. Oxalic acid firm, at 3¾d., both for spot and early delivery. Nitrate of soda steady, at £11. 5s. to £11. 10s., f.o.r. Liverpool.

LIVERPOOL OIL AND COLOUR MARKET.

THURSDAY.

OILS.—Palm oil quiet, sales including Niger at £27. 5s., Hard oils at £27. 10s., Cameroon at £28. 5s., and soft oils at £28. 10s. to £28. 12s. 6d., with Lagos at £31. 10s. per ton, all in transit. Linseed oil quieter, at 26s. 6d. to 27s. 6d. per cwt. for Liverpool makes in export casks. Cottonseed oil steady, at 27s. to 28s. per cwt. for Liverpool refined in export barrels. Tallow quiet. Turpentine at 38s. 6d. per cwt. for spot parcels. Petroleum firm, at 7d. for Russian and Roumanian, and 7½d. to 8¼d. per gallon for American refined oils. Petroleum spirit steady, at 1s. 0¾d. to 1s. 3d. per gallon.

COLOURS.—Red lead, English, £21. 10s., white, £22. 10s. to £22. 15s.; emerald green, 1s. per lb.; Brunswick green, 16s. to 45s. per ton; venetian red, lump, 7s. 6d., powder, 5s. to 6s. 6d. per cwt.; vermilion, English, 2s. 4d., China, 3s. per lb.; Prussian blue, 1s. 10d. to 2s. 6d. per lb., Brunswick, 28s. to 34s. per cwt.

LIVERPOOL DRYSALTERIES.

THURSDAY.

Montreal potashes quietly firm at 36s. per cwt. Logwood steady. Cutch also steady. Gum copal: A brisk demand is reported for Sierra Leone; Gold Coast sold at auction, 55s. to 56s. 6d. per cwt. Castor oil firm but quiet, at 3½d. for good seconds Calcutta on spot, and Nov.-Dec. shipment at 3¾d., French 3¾d. for first pressure, and 3½d. for second pressure. Gambier: Block, 23s. to 23s. 6d. per cwt. for spot parcels; October-November shipment well held at 21s. to 21s. 6d. Cubes, 30s. per cwt., on spot, and 28s. 3d. per cwt. for November-December shipment. Shellac: market depressed and quotations given, 140s. for fair TN orange, on spot. Glucose firm: American liquid, 43%, 12s. 6d. on spot, and 12s. for October-December delivery; for prompt shipment, 10s. 1½d., and for October-December, 9s. 7½d., c.i.f., for shipment. American powdered starch, 11s. on spot, and 10s. 6d., c.i.f., for shipment. Pearl, 10s. 7½d. on spot, and 10s., c.i.f., for shipment. Cream of tartar, 98% foreign powder, 88s.; 95%, 86s. Tartaric acid: English, 11¼d. on spot, and foreign, 11d. Citric acid: English, 1s. 9d.; foreign, 1s. 9d.

HULL PAINT, OIL, AND COLOUR REPORT.

WEDNESDAY.

OILS.—Values of seed oils during the week have been unsteady; in the main prices are higher than a week ago, but lower than previously. Amongst the principal imports here to date, as against the same period a year ago, have been:—Wheat, 3,440,984 qrs., against 3,232,128 qrs.; flour, 175,998 cwts., against 288,093 cwts.; linseed, 668,284 qrs., against 487,828 qrs.; rapeseed, 99,771 qrs., against 100,682 qrs.; cottonseed, Egyptian, 136,183 tons, against 120,927 tons; other kinds, 148,989 tons, against 105,958 tons; oilcake, 21,187 tons, against 32,906 tons; hemp, 109,407 cwts., against 137,690 cwts.; olive oil, 3,678 tuns, against 3,358 tuns; tar, 13,079 brls., against 11,042 brls. Amongst the weekly imports are:—Margarine, 2,854 cwts.; lard, 3,419 cwts.; sugar, 8,801 cwts.; glucose, 1,084 cwts.; hides, 4,103 cwts.; hemp, 6,244 cwts. colours, 2,200 pkgs.; oilcake, 970 tons; wool, 143,024 lbs. Exports:—Oil, 10,101 cwts.; colours, 2,796 pkgs.; chemicals, 1,874 pkgs.; Linseed oil, spot, naked, 24s. 4½d.; November-December, 23s. 10½d.; January-April, 23s.; boiled and refined, £1. to £1. 10s. per ton extra. Exports during the week have £1. to £1. 10s. per ton extra. Exports during the week:—6 tons America, 5 Germany, 1 Holland, 6 Norway, 2 Turkey; total, 20 tons. Refined cotton oil, 23s. 3d., spot, naked; November-April, 23s. 6d.; casks £1., and barrels £1. 7s. 6d. per ton extra. Exports:—2 tons Denmark, 5 France, 34 Germany, 35 Holland, 4 Norway, 9 Turkey; total, 89 tons. Rape oil, Jamba, 34s. 6d., spot. Turpentine, 38s. 3d. Russian ditto, 20s. 9d. Olive oil unchanged. Resin, 11s. upwards. Castor oil unchanged. Linseed and cottonseeds, like oil, have advanced, but have relapsed, closing a little higher than prices recorded a week ago. The crop reports from Argentine continue very favourable for linseed and heavy crops are anticipated.

CAKES.—Linseed cakes very firm, but sales small. Cotton cakes, best makes, 2s. 6d. per ton lower, spot; November, 2s. 6d. dearer; December-April, unchanged. Bombay very firm, tendency dearer.

TYNE CHEMICAL REPORT.

WEDNESDAY.

Chemicals are unchanged and in fair demand. Caustic soda 70%, £10. 5s.; and 76-77%, £11. per ton. Soda crystals locally steady at £3. to £3. 2s. 6d. per ton gross weight. Bleaching powder firm at £5. to £5. 5s. per ton. Sulphur scarce and steady at £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £29. 10s. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

Digitized by Google

COALS.—Market is, if anything, a shade steadier for steam and gas coals, but bunker, coking coals, and coke are all quiet and plentifully offered. For prompt shipment, quotations may be reported as follows:—Best Northumbrian steam, 15s. to 15s. 3d. per ton; second qualities, 14s. to 14s. 6d. per ton; small coals, 10s. 6d. to 11s. per ton; Northumberland unscreened, 12s. per ton; best gas coals, 15s. to 15s. 6d. per ton; Durham bunker coals, 12s. 6d. to 13s. per ton; coking coals, 14s. per ton; household coals, 10s. 6d. to 17s. per ton; foundry coke, 22s. per ton; gas coke, 19s. to 20s. per ton.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Thursday.

The ordinary market (heavy chemicals) continues to show a fair current of business, at values well upheld. Bleaching powder and caustic soda particularly share in the movement going on, and forward (next year's) bookings still figure on the reports. Sulphate of ammonia, prompt business, Leith and Glasgow deliveries, still retains the improved position of the last two weeks; but forward dealing continues unrepresented. The Scottish calico printing works have rather fallen off in activity again; some are reduced, indeed, to only four working days a week, but the market in colour chemicals and drysalteries continues firm, with the old values maintained. In the section of home manufactured mineral oils and paraffins, the feeling is as before, satisfactory from the makers' point of view, and with a good daily bulk of business. English and Irish sales of burning oil now command a farthing per gallon over the contract figures as given below.

Chief prices current are:—Alum (in lump), £5. 5s. to £6., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 15s. to £5., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3½d., nett, Glasgow; creosote (ordinary coal-tar and blast furnace), 2¼d. to 2½d., naked, f.a.s. Glasgow; nitrate of soda, 11s. 4½d.; paraffin scale, hard, 2d. to 2⅛d.; and soft, 2⅜d. to 2½d. per lb.; paraffin wax, 120°, semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¾d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating) 865°, £5. 15s. to £6. 5s.; 885°, £6. 15s. to £7.; 890-895°, £7. 10s. to £8.; prussiate of potash, 5¾d. to 5⅞d., nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £2. 17s. 6d. to £3.; sulphate of ammonia, £12. 5s., prompt, f.o.b. Leith; sulphate of copper, £22. less 5% Liverpool, prompt.

New Companies.

Gamnes Copper Co., Ltd.—Capital £25,000., in £1. shares. This company has been formed to acquire and turn to account certain mining claims and rights on Gamnes Farm, and other rights and properties on the Island of Ringvatso, Karlso, District of Tromso, Norway, and to carry on the business of copper and general miners, prospectors, explorers, metallurgists, etc. No initial public issue. The first directors are J. G. Gordon and L. G. Mortimer (nominated by J. G. Gordon, L. G. Mortimer and G. H. Palmer, known as the Syndicate), C. E. Ingersoll and C. Tazewell (nominated by G. E. Hanssen, C. E. Ingersoll, E. R. Melluish, W. Blackmore, A. Howard and C. Tazewell, the vendors). One of the nominees of the syndicate is to be chairman; qualification 250 shares. Registered office, 1, Gresham House, Old Broad-street, E.C.

Tallow Syndicate, Ltd.—Capital £5,000., in 4,000 A shares of £1. each and 20,000 B shares of 1s. each. This company has been formed to acquire and turn to account any interests in inventions or processes relating to the extraction of an odourless product from train fish or other oils, and to adopt an agreement with E. O. Daniell. No initial public issue. E. O. Daniell is the first director. Registered office, Basing House, Basinghall-street, E.C.

Veredas Lead Mining Co., Ltd.—Capital £50,000., in £1. shares. This company has been formed to acquire the lead mines known as Tres Amigos, Santa Margarita, and Santa Teresa, and other adjoining mines in the province of Cindad Real, Spain. No initial public issue. The first directors are G. Gougoltz, J. Lecarme and J. A. Burton. Qualification £200. Remuneration £200. each per annum. Registered office, 6, Laurence Pountney Hill, E.C.

Lead Wool Co., Ltd.—Capital £8,000., in £1. shares. This company has been formed to take over the business of lead wool manufacturers carried on by H. Packham, B. T. L. Thomson and F. L. Bull, at Snodland, Kent, as the Lead Wool Co., together with the licences for the United Kingdom and British Colonies granted to the said proprietors, assignments of patent rights relating to improvements in metallic packing, and an assignment of leasehold premises at Snodland. No initial public issue. The subscribers are to appoint the first directors. Qualification £500. Registered office, Lead Wool Works, Church Fields, Snodland, Kent.

Crescent Wolfram Estates, Ltd.—Capital £100,000., in 99,000 ordinary shares of £1. each and 20,000 deferred shares of 1s. each. This company has been formed to acquire the benefit of certain agreements for the purchase of metalliferous land in the South Boulder Mining District, Boulder County, Colorado, U.S.A., with a view thereto to enter into an agreement with W. Jackson and W. H. Waller and to carry on the business of wolfram and general miners, prospectors, explorers, metallurgists, etc. No initial public issue. The first directors are A. Nelson, H. Hitchon, J. J. Smithies, W. H. Waller and W. Jackson. Qualification £500. ordinary shares. Remuneration £2,000 per annum, divided. Registered office, Parr's Bank Buildings, 3, York-street, Manchester.

Direct Tin Smelters, Ltd.—Capital £5,000., in £1. shares. This company has been formed to carry on the business of smelters of and dealers in tin, lead, copper ores and metals, assayers, metallurgists, etc. No initial public issue. The first directors are to be appointed by the company or subscribers. Qualification 5 shares.

PRICES CURRENT.

FRIDAY, November 1, 1907.

PREPARED BY MESSRS. HIGGINBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified. The price in different localities may vary.

		£	s.	d.	
Acids :—					
* Acetic, 25% and 40%	per cwt.	9/-	&	13/-	
* ,, Glacial	,,		40/-		
Arsenic S.G. 2,000°	,,		31/-		
* Fluoric	per lb.	0	0	4½	
* Muriatic (Tower Salts), 30° Tw.	per bottle		1/-		
,, (Cylinder), 30° Tw.	,,	0	2	9	
* Nitric 80° Tw.	per ton	14	15	0	
* Nitrous	nett per cwt.	0	18	6	
Oxalic	per lb.	0	0	3¾	
Phosphoric, 1750°	,,	0	0	10½

LATE ADVERTISEMENTS.

MANAGER.—Smart Business Man, with good knowledge and all round experience of chemical trade, wants responsible position. Excellent qualifications, good organiser and accustomed to control.—Box "1,558," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

CHARCOAL:—Flake and Sawdust Charcoal on sale in large quantities.—Apply, "1,564," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

WANTED TO BUY, 4 second-hand Steam Jacketed Pans, must be in good condition Pans without covers wanted and preferably about 3 ft. deep and 800 gals. capacity. Also 2 Wooden Vats holding about 1,000 gals. each and provided with stirring gear. —Send full particulars and prices to "1,577," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

ANTIMONY SMELTER, 22 years' experience, seeks situation, home or abroad. Manufacturer of oxide, sulphide and regulus of antimony from high, low, and complex ores.—"1,581," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

CHEMICAL ASSISTANT (39) experienced in commercial analysis, etc., requires post in works or other laboratory. Good testimonials and educational certificates.—"1,578," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

METALLURGICAL CHEMIST.—Wanted for abroad, a young Metallurgical Chemist, preferably a technical graduate with some practical experience of copper smelting.—Address, stating salary required and giving full particulars of training and experience, to "B.E.P.," c/o Streets, 30, Cornhill, E.C.

MANAGER Wanted for Glue Works in England. Must be up-to-date and capable of making first-class glue from bones and from skins.—Replies, treated confidentially, giving full particulars of experience, salary required, etc., to "Glue," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To Be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

30 Words and under ..... 2s. 6d. per insertion.
Each additional 6 words ..... 0s. 6d. "

Advertisements of Situations Wanted are inserted at the following rates when cash is sent with order:—

24 Words and under ..... 1s. 0d. per insertion.
Each additional 6 words ..... 0s. 3d. "

Advertisements intended for insertion in the current week's issue should reach the office by Thursday morning at the latest.

CURRENT TOPICS.

THE RAILWAY CRISIS.

THE success of the President of the Board of Trade in effecting a satisfactory settlement of the labour dispute in the railway world has created a feeling of profound relief in all sections of the community. The result of a general strike on the railways would inevitably have been disastrous from every point of view. The temporary disorganisation of the principal methods of communication and transport generally would have had such serious and far-reaching effects that the complete removal of the impending danger is an achievement for which Mr. Lloyd-George deserves the heartiest congratulations. His appointment to the Board of Trade, on the advent of the present Government to office, was not received with unqualified approval, especially in trade circles; but his statesmanlike conduct of several difficult and important negotiations had already created a feeling of confidence in his ability, and the settlement of the railway trouble, through his mediation, will do much to enhance his reputation as a worthy head of the great Government department which he controls.

While joining in the general acknowledgment of the tact and resource shown by the President of the Board of Trade in saving the country from what would indeed have been a veritable calamity, it is only fitting that recognition should also be made of the wise and public-spirited moderation shown both by the railway directors and the representatives of the men. The agreement is singularly well devised and far-reaching. For each grade of men on each line a Sectional Board is to be formed, half the members of which will represent the company and the other half representing the men. These Sectional Boards will deal with general questions of hours and wages, and failing an agreement the question in dispute will be referred to a Central Conciliation Board. Such a Central Board will be formed for each Company, and in the event of the directors and the men still failing to agree, the question at issue will then be referred to a single arbitrator, who will be appointed by the Speaker of the House of Commons and the Master of the Rolls. The decision of this arbitrator will be binding on all parties. The agreement is to last for at least six years.

The admirable arrangement which has been reached in this, perhaps the greatest labour dispute of recent times, seems to us conclusively to demonstrate the wisdom of the principle of arbitration as applied to labour troubles. It is, of course, debatable as to whether the principle could be generally applied with such striking success; but in face of this proof of the soundness of arbitration as a solution of labour difficulties, it is scarcely open to doubt that much might be expected from some wisely devised and efficiently administered system of compulsory arbitration;

CHEMICALS IN INDIA AND THE FAR EAST.

A question for the serious consideration of British manufacturers is that of the satisfactory distribution of their products in India and the Far East, and we recently pointed out the importance of this market as an outlet for British chemicals. The question has already received the attention of some wide-awake manufacturers, and stocks for years past have been held in Calcutta, Bombay, or elsewhere, to execute local orders promptly at local prices delivered; the market being canvassed in a commercial manner, according to Indian ideas.

Geographical distance alone, and its attendant drawbacks, hampers many British firms in working this part of the globe by the methods required by modern trading, and progressive firms are compelled to adapt themselves to the altered circumstances. For instance, the distance in miles between London and Bombay is 6,570, Colombo 7,000, Calcutta 8,250, Singapore 8,700, Hong-Kong 10,110, Shanghai 10,900, Yokohama 11,900, Fremantle 10,100, Adelaide 11,500, Melbourne 11,980, Sydney 12,500, etc.

Not only will the ports of Calcutta, Bombay, Karachi, and Rangoon be important centres for trade distribution, but Colombo will likewise have to be considered. The construction of the harbour at Colombo has taken thirty years to complete, at a cost of Rs.25,000,000. The harbour is 660 acres in area, and the work has been designed with a full conception of the importance of the situation, and of the prospective development in commerce along the great sea routes to Australia and the Far East. The distance in miles between Colombo and Cape Town is 4,310, Aden 2,130, Singapore 1,560, Hong Kong 3,000, Melbourne 4,700, Sydney 5,310, Wellington 6,210, and London 7,000.

The question of distribution of British chemicals of all varieties, and the allied products, machinery, etc., likewise that of inter-colonial trading, as well as the trade of China, Japan and Asiatic-Russia, presents important and complex problems to be solved by those producers who are desirous of increasing their business in proportion to the rate at which these Eastern markets are expanding. As already mentioned several commercial firms and trade organisations have established themselves at one of the Indian ports to attend to their Eastern business, instead of attempting to work it from their own country. Such a depot, even if only a modest one, managed by the manufacturer's own salaried representative, could not only attend to the distribution of goods, but could act as buyer of suitable Indian products for the British factory.

Foreign and colonial competitors are, at the moment, giving more than usual attention to the all-important question of distribution, according to local requirements, as, in addition to India's population of 300,000,000, China, with 400,000,000 inhabitants, to say nothing of other Eastern markets, opens up a huge market to cater for.

Manufacturers when sending out advertising matter, handbills, circulars, postcards, etc., for local distribution by the importer, as well as when packing in cardboard or small packages for sending by parcel post, might often remember that India leads the world in the matter of cheap postage. The inland postage rates are :—Postcards, ¼ anna (¼d.) and ½ anna (½d.) for letters weighing one tola. Inland parcels weighing not more than 440 tolas (11 lbs.) are charged at 2 annas (2d.) for every 40 tolas (1 lb.), etc. India has the cheapest postage in the entire world, and the magnitude of the undertaking can be understood when it is mentioned that the Indian Post Office carries articles from Cape Comorin to Chitral and Gilgat, and from the Mektar Coast to the borders of Siam.

NITRATE OF SODA.

The October shipments to Europe were considerably below the mid-monthly estimate, reaching only 136,336 tons, against 177,877 tons last year. On the other hand the quantity "loading" on November 1 was no less than 234,000 tons (the largest on record) compared with the 114,600 tons officially estimated three weeks ago, and 164,000 tons, the actual figure last year, when the November shipments reached 198,409 tons. Last month's European deliveries (including 6,500 tons recently arrived in Egypt !) were 55,290 tons, against 62,750 tons in 1906, and the "visible supply" (stocks and afloat) comes out at 486,260 tons, compared with 492,450 tons at this time last year. The hoped-for large reduction in the Chilian output has not materialised, the October total being advised as 172,222 tons, against 172,041 tons in the corresponding period. The stocks of manufactured nitrate have consequently further accumulated on the West Coast, reaching the unprecedented total of 600,000 tons, against 500,000 tons a twelvemonth ago and 420,000 tons on November 1, 1905. The above figures of "loadings," production, and stocks, combined with financial troubles in Chili and in Hamburg, have completely demoralised the market; prices are again distinctly lower in all positions and nominal in the absence of buyers. Nitrate for prompt shipment is offered at 8s. 4d. per quintal, f.o.b., and spring delivery in Hamburg at 11s. per cwt. Holders in Liverpool, where stocks are about 12,000 tons, compared with 7,000 tons a year ago, have at last given way to *force majeure*, and the premium on "refined" has practically disappeared. The general position will be reviewed in our next issue.

Telegraphic advices received as we go to press report that the market is very flat and lower all round.

The Board of Trade Returns issued on Thursday show that the imports during October were £57,662,116, or an increase of £3,025,054. as compared with October last year, and the exports £38,319,520., or an increase of £5,085,189. Our monthly tables and analysis will appear next week.

Society of Chemical Industry: *Liverpool Section.*—The first meeting of the Section will be held in the Theatre of the Chemical Laboratories, University, Liverpool, on Wednesday, November 13th, when a paper on "The Heat-Treatment of Copper-Zinc Alloy," by Guy D. Bengough, M.A., and O. F. Hudson, B.Sc., will be read by Mr. Guy D. Bengough.

The Bank Rate.—On Monday last, at an emergency meeting of the Directors of the Bank of England, the Bank Rate was again raised from 5½% to 6%. On Thursday, the rate was further advanced to 7%. On the same day the Bank of France raised its discount rate from 3½% to 4%, and the National Bank of Belgium advanced its rate by ½%. It is expected in Berlin that the bank rate of the Imperial Bank of Germany will be raised to 7½%.

The Manchester Gas Exhibition.—For the past fortnight or so a very comprehensive and interesting exhibition of gas appliances, etc., has been held in the St. James's Hall, Manchester. The exhibits, which have covered the whole field of lighting, heating, etc., have included the most recent developments, and we understand that the exhibition has been very successful. A special feature has been a series of lectures, designed to awaken public interest in the extended use of gas, and delivered by recognised authorities in the gas engineering profession, the subject of smoke prevention being treated very fully.

THE PROTECTION OF RIVERS FROM OVER-POLLUTION.

DURING a recent conference of the Royal Sanitary Institute, it was pointed out that a very grave danger to public health in Ireland arose from the pollution of wells, due to leaking drains and sewers, but that under existing requirements loans for new sewers could not be sanctioned unless a complete system of purification works was provided for; the ratepayers' resources would not, however, admit of this. Nothing can be done so long as the Local Government Boards are unable to depart from the unworkable ideals of the existing Rivers Pollution Act—these are based on the misconception that no river in the United Kingdom is long enough to destroy sewage by oxidation. In a careful review of the subject, a writer in the *Manchester Guardian* points out that it is no longer the question of preventing the discharge of unpurified sewage that is the main point of river protection, but rather of safeguarding the fish life, and preventing a nuisance in the stream. The great difficulty that has to be faced is to determine to what extent sewage must be purified. Whether or not sewage matters will cause a nuisance in a river depends upon the proportion of their quality to the quantity of oxygen dissolved in the river water. So long as the latter remains in excess, the water bacteria decompose the former into mineral matters, and the water remains sweet; if the reverse is the case, the oxygen will be quickly consumed before the sewage matters are entirely decomposed. The water bacteria will then set up putrefaction in the remainder, with the result that poisonous bodies will be formed, and the river will become not only incapable of supporting fish life, but even dangerous to the public health.

The limit of pollution can easily be overstepped, since the liquid portions of town sewage require at least one-fifth of their own volume for the decomposition of their polluting organic matters into inoffensive mineral matters, and also since the amount of oxygen which water can hold in solution, when fully aerated, is extremely small—less than eight volumes during winter temperature, and six-and-a-half during summer, per 1,000 volumes of river water.

A question of even greater importance is the rate at which river and sea water can take up fresh oxygen from the air and become re-aerated. This rate will obviously vary with every river, as well as at different parts of the same river, according to its physical features. Experiments under the simplest natural conditions—a deep, sluggish, non-tidal or tidal river in calm weather—show that the rate does not exceed, on an average, one volume of oxygen per 1,000 volumes of fresh water, or one volume of oxygen per 400 volumes of sea water, in 12 hours; from this it will be seen that sea water can be polluted to a greater extent than river water.

It will be gathered that the formulating of standards must involve careful study, not only of the river concerned, but also of the sewage to be discharged into it. In consequence of their varying in each locality, such standards can only be framed and enforced by properly constituted authorities, such as those proposed by the Sewage Commission, and the hope may legitimately be expressed that a Bill embodying their recommendations will be passed through Parliament during the coming Session. There is yet another aspect of river pollution that emphasises the need of legislation. It is the protection of potable water from disease germs. Opinions differ on this subject, but both in America and Great Britain the conclusion that has been formed is that in protecting rivers from all forms of pollution the object to be aimed at is, in the first instance, to preserve them from over-pollution, and subsequently to render their waters fit for domestic use by further and complete purification, both chemically and bacteriologically. An American writer of authority on this subject says:—"With our present knowledge, at least, this would seem to be the wiser provision. We know little, unfortunately, of the viability of disease organisms in sewage and of the effect of purification treatment upon them. While the ideal conditions, and the one toward which sanitarians should ever be working, is the perfect purification of sewage from all pathogenic bacteria before discharge, it may nevertheless be better economy, with our present information, so to purify our sewage as to prevent it from seriously fouling the streams, and thoroughly to purify all waters taken from them for domestic use."

THE ROYAL COMMISSION ON SHIPPING RINGS.

THE report of evidence given before the members of the Sub-Commission appointed to inquire into the question of shipping rings in South Africa has now been issued.

Mr. Henry Heathcote Clarke, chairman of the South African Mercantile Association in London, said that he was opposed to all shipping ring methods. There were State reasons, both imperial and colonial, for objecting to the operations of the rings. The greatest of these was that such rings deprived the Imperial and Colonial Governments of a free and open freight market in which to negotiate their contracts for Government stores and material, thereby forcing them to pay higher rates than would be obtainable in an open market. He could prove that lower foreign sea freights had destroyed the colonial customs preference. Such rates were frequently 50% lower than the British ratio in 1903.

Mr. W. F. Carle, on behalf of the Natal produce shippers, said that so long as a system of rings was based on a consideration of producers' and shippers' interests, as well as those of the steamship owners, no objection need be raised. Constantly changing rates rendered business difficult and precarious. The producer would benefit by lower rates, but unless they could be relied upon they would be of no real use.

Mr. H. J. Butcher, of Butcher and Sons, general importers, said that, providing no preferential rates were quoted to favoured importers, freight rates to various parts were calculated on a logical basis, and that a quick and regular service of steamers were supplied by the shipowners at fair rates of freight, he had no objection to the shipping rings.

Mr. H. A. Lerchen, coal merchant, complained that the Union Castle Line had made a contract with the Natal Mines Association to take over the coal of that Association. The contract was entered into last year, and took effect as from January 1st to the end of 1907. The Union Castle Company took up the position of merchants, and sold coal along the coast at various ports, in addition to using it for their own steamers; such a contract had the effect of excluding the private coal merchant. The ordinary merchant had to look for freights, charter his own boat, and get special freight, but he could never get freight so low as that obtained in the case of a steamship company having its own boats, because the latter could control the freight as they wished.

A NATIONAL TESTING HOUSE.

THE chief engineer-surveyor of Lloyd's Register of Shipping recently paid visits both to the Government Testing Establishment at Gross Lichterfelde and the Barsigwerke in Upper Silesia. His report contains some very interesting observations, of which the following is an abstract.

The Government Testing Establishment is partly State-aided and partly self-supporting. It enables German manufacturers to have systematic testing carried out for commercial purposes; whilst inventors desiring research into new ideas or processes can avail themselves of the resources of the establishment. Investigations are made by the staff for public use, and the results are published periodically.

Much of the expansion of German industries—particularly cement—has been due to the assistance given by this Institute.

Digitized by Google

In addition to a powerful testing machine for making tensile or compressive tests up to 500 tons, there are also a number of testing machines, each designed for a special purpose, and in some of which as many as three separate samples are being simultaneously tested. In some the tests are made at a normal temperature, in others the test pieces are enclosed in asbestos-lined chambers electrically heated to definite points, in order to ascertain the effect of high temperatures upon the mechanical qualities of the materials being investigated. The machines are arranged in four groups of five each, an automatic record of the stresses in each machine being made on a continuous roll of paper worked by electric mechanism.

LARGE POWER GAS ENGINES.

WRITING in the Engineering Supplement of *The Times* on the subject of gas engines, a correspondent, who has just returned from visits to a number of German works where gas power is extensively used, comments on the difference between the attitudes of English and German engineers on this point. At the recent Engineering Conference the general opinion amongst English engineers was that the gas engine could only be regarded as in the experimental stage; Germany, on the other hand, has working to-day gas engines aggregating over 400,000 h.p., without taking into account any engine of less than 500 h.p.

The manager of the Government Works at Heintz, where 650 and 1,300 B.H.P. engines worked by coke-oven gas are employed, states that, including all capital charges, depreciation, maintenance, etc., the cost per b.h.p. works out at one-tenth of a penny. At the Differdinger Iron and Steel Works the manager records a saving of £75,000. a year in his coal bill, dating from the instalment of gas engines. "As a typical example of a modern design," says the *Times* correspondent, "the 2,200 h.p. engines at the Hoesch Iron and Steel Works may be taken. These engines are of the four-cycle, double-acting type, and are notable as developing the largest power per cylinder of any engine yet made.

"The cylinders, two arranged in tandem, are 1,150mm. in diameter, and the stroke is 1,300 mm; speed of revolution, 94 per minute. The overall length is about 60 ft., and they are coupled direct to 1,600 kw. continuous current dynamos which are running in parallel. The valve cams and eccentrics are keyed to the half-speed shaft in the usual way. The mixing, admission, and exhaust valves are of the lift type, and in the case of the exhaust valves both the bodies and the valves themselves are water cooled. An experiment is now, however, being made of dispensing with the cooling of the valves with a view to simplifying the construction. The centrifugal governor acts on the tripping gear of the mixing valves regulating the supply of gas. The air supply is arranged to be constant in quantity and always in excess, so that complete combustion of the gas may be assured, combined with the advantages of constant compression. The mixing and admission valves are mounted on top of the cylinder, and the exhaust valves underneath. The charge is fired in two places simultaneously by electric spark. The cylinder and its mantle are cast in one solid piece. Great care has been bestowed not only upon the design, but also upon the composition of the metal, to ensure its withstanding the stresses accompanying the uneven distribution of temperatures. A cracked cylinder is now a rare experience, and in the few cases which have occurred is traceable to causes unconnected with any inherent weakness in the design or construction of the cylinder itself. The piston and piston-rod are, of course, water cooled, and the tandem system of rod and two pistons is supported by three slipper guides, one being placed between the cylinder. The glands are packed with metallic packing free to move radially, and showed no sign of leakage. Forced lubrication is used, and the supply of oil is liberal. Only the crank end of the frame is bolted to its foundations; the cylinders rest upon suitable seatings, and allow the necessary freedom of movement incidental to the considerable temperature changes."

The writer continues:—"The gas engine has, in England, been somewhat under a cloud. The failure of the Johannesburg installation, combined with other set-backs due to faulty design, arrangement, or construction, has done much to arrest its progress. According to Herr Schiner, a German engineer, if English engineers had received the same amount of encouragement from the iron masters as they in Germany had, the progress of the gas engine would have been the same in both countries. The transfer of designs from Germany by issuing licences to English firms has not secured all that is necessary for success; the full lessons of experience cannot be transplanted so easily, and it is probable that default in this respect accounts for the difficulties encountered in England. England's best policy is to acknowledge Germany's lead, and to make the best use of it either by importing German engineers or by installing a sufficient number of German-built engines as models."

A 150-ton blast furnace will, if the gases are used for gas-fired boilers, supply 2,000 H.P.; but, if utilised by gas engines, 6,000 H.P. can be developed, thus affording a large margin of power for blowing, transport, etc. Ironworks and like installations furnish at the present moment the most important field, but a much wider field is opening out in the demand for cheap power for driving the machinery of factories, electro-metallurgy, and the general supply of electrical energy. The arrival of the gas engine has emphasised the need for an efficient gas producer; the difficulties experienced with producers are not insuperable, being questions rather of niceties of adjustment and regulation than of the removal of any radical defects.

The writer concludes that the gas engine, though a success, cannot by any means be regarded as having reached finality. Opinion amongst German engineers is divided as to the merits of the four and two-cycle engine. The former has a slight advantage as regards efficiency and uniform running; the latter, with its single cylinder, might be expected to be more compact, but in practice it is not so, owing to its increased length of stroke, and there is no saving in material. The greater regularity of speed is, in the case of the four-cycle engine, secured by the governor acting directly on the charge as it is admitted to the cylinder; with the two-cycle type the governor acts on the charge as it enters the pumps, causing thereby an element of delay to be introduced. By the use of "scavenging"—a method of removing the inert products of combustion—the capacity of an engine can be increased 20%. There is not much gain in efficiency, but the first cost for a given power is substantially reduced.

NITRATE STATISTICS.—The Permanent Nitrate Committee, in their Public Statistical Circular for November, state the shipments of nitrate of soda as follows:—(1) Total exports to Europe, October, 2,999,400. quintals (2) Imports, Europe, October, 84,790 tons. (3) Deliveries, Europe, October, 55,290 tons. (4) Visible supply, Europe, 1st November, stocks and afloat, 486,260 tons.

THE CHEMICAL TRADE DIRECTORY.—We regret that inadvertently Messrs. May and Baker, Ltd., of Battersea, London, appear as merchants of Acetate of Amyl in the Classified List of our Chemical Trade Directory, instead of being shown as manufacturers. We were not aware that the product was made at all in this country, at least not on an industrial scale, but having availed ourselves of the firm's invitation to see their plant, we are pleased to record the fact that there is at least one considerable maker in Great Britain of what is generally considered to be exclusively an imported article.

THE FRANCO-BRITISH EXHIBITION, 1908.

ARRANGEMENTS for the Franco-British Exhibition of 1908 are being rapidly proceeded with, and it is satisfactory to hear that considerable progress has been made during the summer months. There is now no doubt that the Exhibition which opens in May next will be upon a larger scale than any previously held in the United Kingdom. The site upon which it will be held at Shepherd's Bush is 140 acres in extent, and is specially suited to the needs of a great Exhibition. The grounds are less than fifteen minutes' ride from Oxford Circus and Regent-street, and twenty minutes' from Trafalgar-square and Charing Cross, while access by railway, motor omnibus, and electric car will be very convenient for visitors. The London County Council have arranged to connect their North and South London Systems by constructing a line past the Exhibition grounds, and this they have arranged to have completed in good time for the opening.

Remarkable progress has been made with the many magnificent buildings which are being erected to house the exhibits. The first sod of the ground was cut at the commencement of this year, and now all the great mass of steel frames are completed, the concrete floors and walls are being put in, the various lakes and canals have been formed, the roads made up, and the numerous gardens commenced. The size of the palaces may be gauged by the framework which is now in position. Each is on a huge scale, and from what is seen of the decoration which is now proceeding, it will be as artistic as the dimensions of the various buildings are large. No timber has been used in the construction, and the whole Exhibition will be absolutel fireproof. To each building is assigned a special class of exhibits. In some cases the French display will occupy one-half, and in another it will rest in a speclal palace. The French Agriculture Committee have alone taken 40,000 sq. ft. and the numerous o her French Committees have also taken large areas.

The Colonies are to have a special section, and it is already certain that our overseas possessions of the Empire will be represented upon a larger and more comprehensive scale than at any previous Exhibition. Canada has secured an area of 120,000 square feet, and the approximate cost of the Canadian palace will be £65,000. Australia has taken a space of 60,000 sq. ft., for a similar purpose, and will expend £40,000. New Zealand and the Crown Colonies have likewise taken space upon a similarly extensive scale. The Indian Government have also made a substantial grant towards the expenses of their section. With regard to the French Colonies a special association has been formed to arrange for their representation. Collectively they have secured an area of 275,000 square feet, and upon this will be erected buildings typical of the countries represented. The displays of the Colonies will be arranged along both sides of the Colonial Avenue in the form of a huge horseshoe, the British occupying one side and the French the other. This will undoubtedly form one of the most interesting and instructive portions of the Exhibition.

A special group will be devoted to chemical industries, and Mr. Alfred Mond, M.P., is president over the Committee which is arranging the display. Every branch of the trade will be represented, from applied chemistry and pharmacy to the manufacture of paper, tobacco, and matches, and from leather and skins to perfumery. The exhibit will be housed in a magnificent building close to the entrance fronting the first of a number of handsome courts, while the corresponding French collection will be found in an adjacant hall, so that a comparison of the industries of the two nations will be possible.

Bazaars, side-shows, and other features of the kind have been rigorously done away with, and the whole undertaking gives promise of an Exhibition in which British traders in all parts of the world will have the best opportunity ever offered of showing the excellence of their products.

A novel feature will be the establishment of a series of Commercial Bureaux, in which exhibitors and visitors will be brought together, so that those taking part in the Exhibition may derive the greatest possible advantage, and those visiting the Exhibition for business purposes will be able to obtain all the information they require at a minimum of time and trouble. Local committees have been organised throughout the United Kingdom to facilitate the collection of suitable exhibits of which the various districts make a special feature.

The whole of the financial arrangements are in the hands of a Finance Committee, at the head of which is Lord Welby, and are secured by guarantee. The whole of the profits are to be devoted to some national object, to be decided upon by the representatives of both the British and French Governments. Thus the Exhibition is in a true sense a national undertaking.

If any proof were required of the enthusiasm with which the Exhibition has been received—apart altogether from the material support given in the way of application for space—it would be found in the list of prominent men who are actively co-operating to ensure its success. The Duke of Argyll is Honorary President, and the Earl of Derby President, while six Cabinet Ministers have accepted office as Honorary Presidents of the various sections:—the Earl of Elgin, Earl Carrington, Mr. Lloyd-George, Mr. McKenna, Mr. Gladstone, and Mr. Sinclair,—the Earl of Minto, Viceroy of India, occupying a similar position. The Vice-Presidents include many of the best-known names in Great Britain, while of the Executive Committee are Viscount Selby (Chairman), the Duke of Devonshire, Earl Cadogan, Lord Strathcona, Lord Alverstone, Lord Blyth, the Earl of Jersey, Lord Castletown, Lord Desborough, Lord Weardale, Lord Welby, Mr. Charles Charleton, Mr. Frank Debenham, the Rt. Hon. Ailwyn Fellowes, Sir William Holland, Mr. Imre Kiralfy, the Hon. Charles Napier Lawrence, Sir Norman Lockyer, Sir William Mather, Mr. C. Freeman Murray, Sir E. J. Poynter, Sir Isidore Spielmann, the Hon. Arthur Stanley, Sir Howard Vincent, Sir Wm. H. White, and Sir C. Rivers Wilson. Lord Blyth is at the head of the Orgaising Committee, and Mr. Imre Kiralfy has been appointed Commissioner-General. Each of the many groups is being arranged by a separate committee formed of experts in the particular branches of industry to which they are to be devoted, and the names of the chairmen alone form an imposing list. The list is as follows:—Education, Sir William Mather; Science, Sir Norman Lockyer; Fine Arts, Sir E. J. Poynter; Liberal Arts, Sir H. E. J. Jerningham; Engineering and Shipping, Sir Wm. H. White; Constructional Engineering, Sir Alexander Binnie; Mechanical Engineering, T. Hurry Riches, Esq.; Gas Engineering, Henry E. Jones, Esq.; Electrical Engineering, Henry E. Jones, Esq.; Electrical Engineering, Dr. R. T. Glazebrook; Mining Engineering, Mr. Maurice Deacon; Metallurgical Engineering, Sir Charles McLaren, Bart.; Iron and Steel, Sir Hugh Bell, Bart.; Other Metals, Prof. W. Gowland; Shipbuilding and Marine Enigneering, Dr. Francis Elgar; Shipping, Mr. James Dixon; Transportation, Mr. H. Cosmo Bonsor; Surface Transport, Sir Clifton Robinson; Agriculture, Lord Blyth; Viticulture, Mr. Robert A. Yerburgh; Horticulture and Arboriculture, Lt.-Col. D. Prain; Alimentation, the Earl of Bessborough; Decoration and Furnishing, the Earl o Plymouth; Textiles, Mr. Frank Debenham; Chemical Industries, Alfred Mond, Esq.; Various Industries, Sir Howard Vincent; Social Economy, Mr. H. Percy Harris; Colonial, the Hon. Sir John A. Cockburn; Indian, Sir William Lee-Warner; Ceylon, Sir Thomas Lipton; Woman's Work, the Countess of Jersey (President) and the Duchess of Sutherland (Vice-President); Sports and Physical Culture, Lord Desborough; and Congress and Conference, Lord Weardale.

The entire movement has been taken up so strongly on both sides of the Channel that it has already been found necessary several times to enlarge the original area. Even this has not been found of sufficient size, and additions, in the form of

Digitized by Google

extensions are consequently being made to all the main buildings.

Allotments will shortly take place, so that applications for space should be sent in by the 15th of this month. Judging by the names of the firms who have already taken space, the Exhibition will be the most complete representation of British manufactures and industries ever brought together, and will be a practical demonstration to the world of progress made during the last half-a-century in all departments of trade and commercial developments throughout the British Empire.

THE DEODORISATION OF FISH OILS.

By Josef Hankam (communicated by H. Wiskemann).

(*Concluded from p.* 380.)

THE progress made during the last few years in freeing cooking fats (more especially cocoa-nut cooking fats) from undesirable odour, has given many useful hints. The employment of mechanical methods rendered it possible to attain the desired object in a more satisfactory way than had been done by chemical agents alone. At first, steaming the fish-oils was tried, but the results obtained were but slight, as I found myself by experiments made on a rather large scale and in the most varying combinations. The moist steam was not able to carry off the volatile smelling substances, and even the simultaneous use of the vacuum proved insufficient. By passing a stream of air for several hours through the heated fat—an operation which I employ in the case of fish-oils for the production of an artificial degras, "moellon"—I succeeded only in eliminating a small portion of the smelling substances; after some time, however, the characteristic odour of fish-oil re-appeared in undiminished intensity.

The use of superheated steam, first resorted to in the manufacture of cocoa-nut cooking fats, at last opened up a way for the solution of the problem, and this method enables one to approximately attain the desired end. I advisedly say approximately, for even by means of superheated steam properly used in the light of experience, the smelling substances cannot be thoroughly eliminated; a slight odour always remains. But such slight odour (as I specially observed in several soap-works in Germany), though perceptible, is not disagreeably so in soap made from such deodorised fish oils.

Superheated steam is used for the elimination of smell from fats in general according to greatly different (and some of them patented) methods. So *Emilien Rocca*, of Marseilles,* has constructed an apparatus—resembling the column apparatus used in alcohol distilleries—specially for the purpose of deodorising inferior cocoa-nut oils (Java). This apparatus consists of a cylinder (provided with plates), in which fat and steam act upon each other in an opposite direction; the fat, for instance, runs from an upper reservoir into the column apparatus, passes each plate, and from the opposite direction the superheated steam enters the apparatus, carries away with it, on its passage, as far as possible the odorous volatile constituents, and, saturated with these, leaves the cylinder and passes through a series of condensing vessels in which the odorous substances are precipitated. As is seen from the foregoing, Rocca's apparatus acts on the principle of the counter-current, and for working on a large scale a combination of several columns is provided. As far as I know, this apparatus is not yet in use in German factories. Owing to the more or less complicated arrangement of the apparatus I was not in a position to make experiments in respect of the case immediately in question; at all events some result may presumably be obtainable with this apparatus.

According to *Culmann*† it is possible—by subjecting oils and fats to the action of superheated steam, or by boiling them with a diluted solution of alum—to precipitate the glue-like substances they contain, and to eliminate a portion of the free volatile fatty acids. It is known, for example, that palm-oil is subjected to the action of superheated steam at 260° C. in order to purify it. In the case of fish-oil, however, the use of steam and a solution of alum is, according to Culmann, hardly possible, because on account of its peculiar composition it would be completely destroyed. At lower temperatures (110° to 120° C.), however, persistent emulsions form and prevent purification. Culmann proceeds, therefore, in the following way. According to his observations fish-oil is thoroughly purified, and the forming of any emulsion is avoided by the simultaneous action of hot saturated solutions of alum or aluminium sulphate and of superheated steam. Only the lower grade fatty acids are split up. The above-mentioned method of Culmann rests directly on the method of Lake‡, who was the first to employ alum together with superheated steam for deodorising.

Another method, in which superheated steam is used, is *H. H. Kaalund's* (of Aalborg)§ method. The oleine is distilled with superheated steam and exposed at the same time to the action of a stream of carbonic acid. Carbonic acid has a destructive effect on the putrefactive alkaloids which form phonicin, and a pure, odourless oleine is obtained.

Much attention is claimed by *P. Pick's*** method, elaborated especially for the purifying and conserving of fats and oils. To some extent, however, it is also applicable for the deodorising of fish-oils and fish-fats. Pick subjects oils and fats to the action of hot, indifferent gases, CO_2 for example, an operation by which the fats and oils are freed from water and completely conserved, while the albuminous substances coagulate.

Having made mention of some of the apparatus and methods devised for the case in question, I would in conclusion (as far as the scope of this article will admit) give a few hints regarding deodorisation of fish-oils and fish-fats on the basis of my extended observations. I consider it necessary for attaining the desired end that the fish-oils whose deodorisation is aimed at should, as a preliminary, be treated with concentrated sulphuric acid. For this purpose the oils must be properly dried, and then, by means of a not too large quantity of concentrated acid, be freed to the greatest possible extent from their glue-like and albuminous constituents. It is, of course, of very great importance that the oil and acid should be thoroughly and intimately mixed, as is always the case in acidification, and to meet this special case, I have constructed a very simple but very suitable apparatus. The preliminary treatment with acid does not aim at splitting up the fat. The splitting-up proper of the smelling fish-oil fats, which, in my opinion, is absolutely necessary†† for successful deodorisation, takes place in an autoclave by means of magnesia under a pressure of 9 to 10 atmospheres (140 to 150 lbs.) in the usual way. Not till then are the resulting fatty acids (whose smell has now greatly decreased) subjected to the process of deodorisation proper. For this purpose I use superheated steam, to the action of which I subject the fish-oil fatty acids for some time at a suitable temperature. Simultaneously with superheated steam I make use of a vacuum, and, especially for the purpose of deodorising fish-oils and fish-fats, I have constructed a very suitable apparatus which, as has been shown by my practical trials, made on a large scale, ensures the best result at the lowest cost.

The method requires the splitting-up of the fish-oils, and for this reason it may on the mere face of it seem to entail too heavy expense; but this consideration is counterbalanced, in the first place, by the quantity of glycerine that is obtained, and, secondly, the resulting fish-oil fatty acids can be worked up in the manufacture of soap by saponification with carbonates of alkalis at far less expense than the neutral fats by means of caustic alkalis. The greatest advantage, however, consists in that the fatty acids can be rendered almost odourless.

If it is a question, as happens to be the case with very dark descriptions of whale-oil, of producing a light fatty acid, for which purpose, therefore, distillation would be necessary, it is the finished distillate which should be subjected to deodorisation.

Tin Mining in England.—The American, Consul at Plymouth writing on the renewed mining activity in Cornwall, observes that there is still an enormous amount of tin to be extracted from the Cornish hills. Many old mines were closed not for lack of tin, but because the market was being flooded with foreign tin, which was then produced at a price with which the deep and costly Cornish mines could not compete. This foreign supply has now greatly diminished, and the world again turns for its supply to Cornwall. Old mines are being reopened and new claims started. Reliable judges affirm that Cornish mining has a great future, and that the district is entering upon an era or profitable enterprise.

* German Imp. Pat. No. 127,492.
† German Imp. Pat. No. 110,791.
‡ English Patent No. 2,100.
§ Swedish Patent No. 11,958 of 14th Aug., 1899. See also "Chemiker Zeitung" of 1901.
** German Imp Pat. No. 166 866.
†† For some time I have repeatedly had (in Germany) the opportunity of observing in soap works, where the fish-oil fat is split up, that after leaving the autoclave their smell had decreased considerably.

Reports of Companies.

PAN DE AZUCAR NITRATE COMPANY.

The report for the year ended June 30 states that the profit and loss account shows a gross profit of £40,303., from which have to be deducted exhaustion of raw material, depreciation of plant, London charges, income tax, etc., leaving a balance of net profit of £24,922. Adding to this the balance carried forward from 1906, and deducting the interim dividend paid in June, there remains a balance of £22,222. The directors recommend a final dividend of 6%, tax free (making 12% for the year), they place £10,000. to the reserve fund, write off the further outlay on extension and improvement of plant referred to below, and carry forward £3,799. Debentures to the amount of £40,000., the outstanding balance at June 30, 1906, were paid off on Sept. 30 following. In the year under review profit has been taken on 410,750 quintals nitrate, as compared with 424,250 quintals in the previous year. The extensions and improvement in plant referred to in the last report were completed in the early part of 1907, at a total cost of £6,163., of which sum £4,340. was written off last year, and it is now proposed to write off the balance of £1,823.

COLORADO NITRATE COMPANY.

The report for the year ended June 30 states that the profit and loss account shows a profit of £127,657. After adding balance from previous account, and transferring to depreciation account £6,338., to debenture redemption account £12,000., and to debenture sinking fund £38,000., the directors propose to place £10,000. to depreciation account, in respect of the old property account, to set aside a further sum of £38,000. as provision for redemption of debentures (in excess of the two half-yearly drawings of £6,000. each), and recommend a dividend of 20s. per share, free of income tax, making a total dividend of 40s. per share for the year.

LIVERPOOL NITRATE COMPANY.

The report of the directors for the year ended June 30 states that the profit and loss account shows a balance of £74,974. After adding balance from previous account and transferring to reserve fund £9,000., and to depreciation account £22,000., the directors propose to place £6,000., to the reserve fund, raising it to £50,000., and recommend a dividend of 32s. 6d. per share, free of income tax, making a total distribution of 60s. per share for the year.

MALACCA RUBBER PLANTATIONS, LTD.

At the meeting of the Malacca Rubber Plantations, Ltd., last week, the Chairman said that the Asahan Estate when taken over by the company was managed by Chinese and run on Chinese lines, but it was not continued on these lines, and the estate was now under European management. An arrangement had been made with the original vendors of this estate to acquire the Kesang Rim Estate at no cost to the Company, and only conditional on their granting a loan of £5,000. for two years at a low rate of interest. The area owned by the Company now totalled over 13,000 acres, of which 6,000 were already under rubber, and, according to latest advices, they expected to have by December 31 about 6,600 acres under rubber. They thought that a conservative estimate should give them a million trees.

AMELIA NITRATE CO., LTD.

At the meeting of shareholders on Wednesday last, Mr. Lowe, who presided, said that in spite of higher-priced labour and dearer provisions, due to the earthquake, the net profit amounted to £48,939. The directors proposed to appropriate £23,000. for the final redemption of the debentures, and £24,000. in payment of 48% on account of accrued interest on the preference shares. As to the prospects of the nitrate industry, good results seemed promising. There was no danger of over-production, and though the price was not now so high, he did not favour the extreme prices that had lately prevailed. The labour troubles were not so acute as they had been, although since higher wages had been paid to the natives considerably less work was done. At a special meeting which followed it was agreed to purchase new grounds in the Province of Antofagasta, and to increase the capital of the company to £206,000.

THE INDIAN INDIGO CROP.

THE first General Memorandum on the indigo crop of the season 1907-08 has now been issued by the Commercial Intelligence Department of India. The provinces dealt with in this memorandum contain 98% of the total area under indigo in British India, calculated on the average of the five years ending 1905-06. The average area under the crop in that period is 617,000 acres; but in 1906-07 the total acreage reported at the corresponding period was only 335,400, and the figures for 1907-08 now reported are 328,500, thus representing a decrease of 2%. The condition of the crop is reported to be generally from fair to good; but some damage has been done by insects and irregular rainfall in parts of Bengal, while want of rain is being felt in parts of Madras.

Estimate of the Area under Indigo in October.

Province.	1907-08.	1906-07.	1905-06.
Bengal	153,000	137,800	170,700
Madras	76,600	94,900	51,500
United Provinces	55,000	40,400	40,700
Panjab	43,900	62,300	67,500
Total	328,500	335,400	330,400

The following is a summary of the provincial reports. The figures in brackets, following the name of each province, indicate what percentage of the total indigo area of British India is ordinarily cultivated in that province:—

Bengal (37.6%).—The area sown is reported to be 153,000 acres against 137,800 acres of last year—an increase of 11%. Weather conditions were generally favourable in the important indigo growing districts of North Bihar. Some damage was, however, done by caterpillars in Saran in the beginning of the season; and in Purnea the crop suffered from deficient rain in May and June, and from excessive rain in July; locusts also did some damage. The average outturn per acre is estimated to be 76% of the normal, as compared with 79% last year.

Madras (31%) reports the total area sown in *raiyatwari* villages up to the end of August to be 76,600 acres, which is 19% less than the area at this date last year. The decrease is attributed to less demand and to want of seasonable rainfall in Nellore and Cuddapah. The crop is reported to be in fair to good condition, but rain is required in some places.

United Provinces (19.6%).—The total area sown is roughly estimated at about 55,000 acres, compared with 40,400 acres last year—an increase of 36%, attributed to good prices realised last year. The crop germinated freely, and water for irrigation was generally sufficient. No injury from insects or hot winds has been reported except from some of the eastern districts. The rains, though unusually late, have been favourable to indigo, and prospects are generally good.

Panjab (9.8%) estimates the area sown to be 43,900 acres, compared with 62,300 acres finally ascertained last year—a decrease of 29%, attributed to the late flowing of the canals for irrigation in the Muzaffargarh and Dera Ghazi Khan districts. The general condition of the crop is normal.

Briseis Tin Miles.—The directors have declared a further interim dividend (number eight) of 9d. per share, free of income tax.

Coal in Chile.—It is announced that a 7-foot vein of a fine quality of Coal has been discovered near Valdivia, Chile, at a depth of 100 feet. It is the thickest vein yet discovered, the one at Lebu being from 4 to 6 feet, and the one at Lota from 4 to 5 feet. Steps are being taken to develop the mine.

Chilean Nitrate.—From Valparaiso U.S. Consul Lupton reports as follows on the Chilean nitrate production. The exportation in 1906 of 17,279,651 metric quintals (of 220.46 pounds each), reduced to the unit of the fields, gives 37,564,460 Spanish quintals (101.6 pounds per quintal), valued at $84,520,035 United States gold. The cost of exploitation per Spanish quintal delivered on board and includingthe Government tax of 28 English pence per quintal, as given by the different countries, varies from 4.4 to 5.17 pesos. As the product is worth about 9 pesos per quintal, this shows an average profit of nearly 50%. La Asociacion Salitrera de Propaganda, which regulates the exportation and the quota of each company, when arranging for the year ending March 31, 1907, took into consideration 135 oficinas, with an estimated capacity of 76,000,000 Spanish quintals, and authorised an exportation of 43,000,000 quintals.

ALUM MANUFACTURE.

THE following is the text of the Complete Specification, No. 28,581, of December 14, 1906, granted to Erich Strohbach, of Niedersedlitz-Dresden, Germany, for improved manufacture of sodium alum, potassium alum, or ammonium alum free from iron and in small crystals.

The commercial manufacture of sodium alum, potassium alum, and ammonium alum has hitherto been conducted on one or other of the following quite different lines :—

Whereas the manufacture of potassium alum and ammonium alum proceeds smoothly when the corresponding sulphate is dissolved in a hot solution of aluminium sulphate, and the solution is crystallised by gradual cooling in special crystallising vats, the manufacture of sodium alum by this process is not satisfactory. The formation of a white, amorphous, pasty mass hinders the direct subsequent treatment of the product. It has frequently been attempted to set aside this difficulty, on the one hand by suitable treatment of the amorphous modification, and on the other hand by avoiding the formation of this modification.

According to the present invention sodium alum, potassium alum and ammonium alum are made directly of surprising purity and without passing through an amorphous condition. In contradistinction to the known processes, temperatures of 25-50° C. and an excess of alkali sulphate are necessary, according to the present invention, for directly obtaining a sodium alum which is free from iron, non-efflorescent, and in small crystals ; the same conditions may obtain for the production of pure potassium alum and ammonium alum in small crystals. In the case of these salts, however, the aluminium sulphate may be in excess ; thus the aluminium sulphate may be used in solution, and the solid alkali sulphate stirred into the solution, or the alkali sulphate may be dissolved and the solid aluminium sulphate stirred into the solution. In either case one of the two components must be in excess, it being of the essence of the invention that one of the constituent salts should be present in excess to exert, as it were, a salting-out action. In contradistinction to the hitherto generally adopted opinion that non-efflorescent sodium alum can be obtained only from neutral aluminium sulphate solution as free as possible from iron, I have found that non-efflorescent sodium alum may be obtained in presence of an excess of alkali sulphate and in presence of free acid ; that the presence of free acid in the production of alkali alums free from iron or from aluminium sulphate solutions containing much iron is advantageous ; that free acids, contrary to published statements, affect the yield only in minor degree ; that, on the other hand, increasing the acid content of the aluminium sulphate solution by 1-5% without the protective influence of an excess of alkali sulphate diminishes the yield.

Furthermore, my investigations have revealed the comparatively sparing solubility of sodium alum in an acid solution of sodium sulphate.

The process for the manufacture of sodium alum, according to the invention, is conducted as follows :—Commercial aluminium sulphate solution containing much iron and of a specific gravity not lower than 1.250 at 15° C. is mixed with 1-5% of its weight of concentrated sulphuric acid, according to the content of iron, and is heated to 25-50° C. Into the clear filtered liquor is introduced finely ground calcined Glauber's salt of commercial purity, while stirring, in such proportion that in addition to that theoretically required to produce the alum, there is added sufficient for simultaneously producing a nearly concentrated sodium sulphate solution. According to the concentration of the aluminium sulphate liquor, therefore, the proportion of sodium sulphate used varies.

The formation of the alum begins immediately, accompanied by the rise of temperature, and is soon completed if stirring be continuous. By centrifugal action the magma of alum thus produced is made to yield a brilliantly white alum meal consisting of small crystals which are nearly free from iron and chlorine, and have a constant content of 11.20% of Al_2O_3. The crystals are dried in any suitable manner at a temperature below 50° C., at which temperature they do not effloresce, and are permanent.

For the manufacture of sodium alum according to this process, sodium bisulphate may be used if the aluminium sulphate liquor is concentrated.

The process may also be carried out by introducing into a concentrated solution of sodium sulphate, made acid by adding the aforesaid proportion of concentrated sulphuric acid, solid aluminium sulphate containing iron, the temperature of the liquid being 25-50° C., and stirring being conducted the while ; care must be taken, however, that the alkali sulphate remains in excess.

In order to obtain chemically pure sodium alum of like form from the small crystals of sodium alum, the latter is re-crystallised.

The known process for crystallisation is not direct ; in the first place alum paste is obtained by cooling a solution of sodium alum which has been sufficiently evaporated, and this paste is then allowed to stand for two and a half days in a thin layer in order to obtain the alum crystals.

By applying the process next to be described, sodium alum in small crystals is obtained directly from hot concentrated sodium alum solution. The sodium alum is dissolved by stirring it with a proportion of water insufficient to dissolve it at 30° C., and then gradually heating the mixture until dissolution is complete. The liquid is then concentrated to about two-thirds of its volume by evaporation, and after filtration is cooled, in an apparatus having a large cooling surface, as quickly as possible to 30-40° C. By now setting the super-cooled liquor into continuous movement and inoculating it with previously prepared pure sodium alum crystals, small crystals of sodium alum quickly separate in a pure condition. The formation of the amorphous paste hitherto produced is not to be feared when this mode of operation is adopted.

Potassium alum and ammonium alum in small crystals may be manufactured in manner analogous to that first described, only in this case the initial temperature may be between 25 and 50° C. This is the average temperature of the liquor during working. Instead of the excess of alkali sulphate, there may be used in this case an excess of aluminium sulphate amounting to 20-30%. At longest the conversion is complete in five hours if the magma is well stirred.

Instead of an alkali sulphate, an alkali double sulphate may be used.

Potassium alum and ammonium alum may also be obtained in small crystals by introducing solid aluminium sulphate into a feebly acid concentrated solution of the corresponding alkali sulphate.

As compared with the customary process, that is to say the dissolution of the alkali sulphate at the boiling temperature and crystallisation in special crystallising vats, this new process presents considerable advantage in the greater purity of the alums produced.

The duration of the crystallising process is now a few hours instead of the days occupied in the earlier process. Moreover, the loss of finished goods is avoided, which in the old process was inevitable owing to the separation of coarse crystals on the walls and the bottom of the vat. Besides these advantages with respect to time and saving of material, the small crystalline form of the product is of considerable importance owing to the comparative difficulty which exists in dissolving potassium and ammonium alums. Moreover, the yield of alum is good.

The claims of the specification are :—

(1.) The herein described manufacture of sodium alum, potassium alum, or ammonium alum, free from iron and in small crystals, by stirring into a solution of aluminium sulphate, preferably feebly acid, having a specific gravity of 1.25, and at a temperature of 25-50° C., an excess of a solid powdered alkali sulphate, bi-sulphate or alkali double sulphate, and separating from the mother liquor the magma of small alum crystals thus produced at a temperature approximating to that at which sodium sulphate is most soluble.

(2.) The modification wherein solid aluminium sulphate is stirred into a solution of an alkali sulphate, bi-sulphate or alkali double sulphate, preferably feebly acid, in such manner that the alkali sulphate or the like remains in excess.

(3.) The modification wherein, in making potassium alum or ammonium alum free from iron and in small crystals, the aluminium sulphate is used in excess.

(4.) As a further step in the manufacture of sodium alum free from iron, and in small crystals, referred to in Claim 1, purifying the sodium alum by re-dissolving it and strongly super-cooling a hot concentrated solution of the alum and keeping the solution in movement until crystallisation is complete.

Russian Mercury Prices.—The *Torg. Prom. Gazeta*, in commenting on the rise in prices for mercury, observes that the Russian market has been quick to take advantage of it, and shows that the latest advices put the prices at a rise from 82 to 95 roubles per bottle up to 89 to 92r. per bottle as one week's improvement.

THE NEW PATENTS ACT.

PART I.—(*Continued from page* 398.)

Crown.

29.—A patent shall have to all intents the like effect as against His Majesty the King as it has against a subject:

Provided that any Government department may, by themselves, their agents, contractors, or others, at any time after the application, use the invention for the services of the Crown on such terms as may, either before or after the use thereof, be agreed on, with the approval of the Treasury, between the department and the patentee, or, in default of agreement, as may be settled by the Treasury after hearing all parties interested.

30.—(1.) The inventor of any improvement in instruments or munitions of war may (either for or without valuable consideration) assign to the Secretary of State for War or the Admiralty on behalf of His Majesty all the benefit of the invention and of any patent obtained or to be obtained for the invention; and the Secretary of State or the Admiralty may be a party to the assignment.

(2.) The assignment shall effectually vest the benefit of the invention and patent in the Secretary of State or the Admiralty on behalf of His Majesty, and all covenants and agreements therein contained for keeping the invention secret and otherwise shall be valid and effectual (notwithstanding any want of valuable consideration), and may be enforced accordingly by the Secretary of State or the Admiralty.

(3.) Where any such assignment has been made, the Secretary of State or the Admiralty may at any time before the publication of the complete specification certify to the comptroller that, in the interest of the public service, the particulars of the invention and of the manner in which it is to be performed should be kept secret.

(4.) If the Secretary of State or the Admiralty so certify the application and specifications, with the drawings (if any), and any amendment of the complete specification, and any copies of such documents and drawings shall, instead of being left in the ordinary manner at the Patent Office, be delivered to the comptroller in a packet sealed by authority of the Secretary of State or the Admiralty.

(5.) The packet shall, until the expiration of the term during which a patent for the invention may be in force, be kept sealed by the comptroller, and shall not be opened save under the authority of an order of the Secretary of State or the Admiralty or of the law officer.

(6.) The sealed packet shall be delivered at any time during the continuance of the patent to any person authorised by the Secretary of State or the Admiralty to receive it, and shall if returned to the comptroller be again kept sealed by him.

(7.) On the expiration of the term of the patent, the sealed packet shall be delivered to the Secretary of State or the Admiralty.

(8.) Where the Secretary of State or the Admiralty certify as aforesaid, after an application for a patent has been left at the Patent Office, but before the publication of the complete specification, the application and specifications, with the drawings (if any), shall be forthwith placed in a packet sealed by authority of the comptroller, and the packet shall be subject to the foregoing provisions respecting a packet sealed by authority of the Secretary of State or the Admiralty.

(9.) No proceeding, by petition or otherwise, shall lie for revocation of a patent granted for an invention in relation to which a certificate has been given by the Secretary of State or the Admiralty, as aforesaid.

(10.) No copy of any specification or other document or drawing, by this section required to be placed in a sealed packet, shall in any manner whatever be published or open to the inspection of the public, but, save as in this section otherwise directed, the provisions of this Act shall apply in respect of any such invention and patent as aforesaid.

(11.) The Secretary of State or the Admiralty may at any time waive the benefit of this section with respect to any particular invention, and the specifications, documents, and drawings shall be thenceforth kept and dealt with in the ordinary way.

(12.) The communication of any invention for any improvement in instruments or munitions of war to the Secretary of State or the Admiralty, or to any person or persons authorised by the Secretary of State or the Admiralty to investigate the same or the merits thereof, shall not, nor shall anything done for the purposes of the investigation, be deemed use or publication of such invention so as to prejudice the grant or validity of any patent for the same,

(13.) Rules may be made under this Act, after consultation with the Secretary of State and the Admiralty, for the purpose of ensuring secrecy with respect to patents to which this section applies, and those rules may modify any of the provisions of this Act in their applications to such patents as aforesaid so far as may appear necessary for the purpose aforesaid.

31.—(1.) In an action or proceeding for infringement or revocation of a patent, the court may, if it think fit, and shall on the request of either of the parties to the proceeding, call in the aid of an assessor specially qualified, and try the case wholly or partially with his assistance; the action shall be tried without a jury unless the court otherwise directs.

(2.) The Court of Appeal may, if they think fit, in any proceeding before them call in the aid of an assessor as aforesaid.

(3.) The remuneration, if any, to be paid to an assessor under this section shall be determined by the court or the Court of Appeal, as the case may be, and be paid as part of the expenses of the execution of this Act.

32.—A defendant in an action for infringement of a patent, if entitled to present a petition to the court for the revocation of the patent, may, without presenting such a petition, apply in accordance with the rules of the Supreme Court by way of counterclaim in the action for the revocation of the patent.

33.—A patentee shall not be entitled to recover any damages in respect of any infringement of a patent granted after the commencement of this Act from any defendant who proves that at the date of the infringement he was not aware, nor had reasonable means of making himself aware, of the existence of the patent, and the marking of an article with the word "patent," "patented," or any word or words expressing or implying that a patent has been obtained for the article, stamped, engraved, impressed on, or otherwise applied to rhe article, shall not be deemed to consrtute notice of the existence of rhe patent unless the word or words are accompanied by the year and number of the patent:

Provided that nothing in this section shall affect any proceedings for an injunction.

34.—In an action for infringement of a patent, the court may on the application of either party make such order for an injunction inspection or account, and impose such terms and give such directions respecting the same and the proceedings thereon as the court may see fit.

35.—In an action for infringement of a patent, the court may certify that the validity of the patent came in question; and if the court so certifies, then in any subsequent action for infringement the plaintiff in that action on obtaining a final order or judgment in his favour shall, unless the court trying the action otherwise direct, have his full costs, charges, and expenses as between solicitor and client.

36.—Where any person claiming to be the patentee of an invention, by circulars, advertisementr, or otherwise, threatens any other person with any legal proceedings or liability in respect of any alleged infringement of the patent, any person aggrieved thereby may bring an action against him, and may obtain an injunction against the continuance of such threats, and may recover such damage (if any) as he has sustained thereby, if the alleged infringement to which the threats related was not in fact an infringement of any legal rights of the person making such threats:

Provided that this section shall not apply if the person making such threats with due diligence commences and prosecutes an action for infringement of his patent.

(*To be continued,*)

Answers to Correspondents.

We cannot undertake to reply to correspondents through the post. Those of our readers who have addressed queries to us should look in this column for a reply.

S. T.—The point you raise has been dealt with on various occasions.

F. W. A.—Thanks for documents. We should be glad to have the blocks, as promised.

J. B., LTD.—An article dealing with the subject you mention, appeared some time ago in the *Journal*.

S. B.—We do not know the address of the company referred to, but you would be able to obtain this on application to Somerset House.

E. C. AND SONS.—The entry of creosote in our London exports is correctly abstracted from the Customs returns. We are verifying this shipment for your satisfaction.

Continental Notes.

In the *Chemiker-Zeitung* for October 16, Dr. C. R. Böhm continues his paper on the electric conductivity of carbides, and the preparation of glow-lamps with metallic filaments. The elements considered in this instalment include thorium, titanium, uranium, tungsten, chromium, nickel, silicon, platinum, aluminium, magnesium, and the alkaline earths. Of the many different sorts of lamp that have been prepared very few appear to possess any technical importance. Another section of the same paper appears in the issue of October 19, in which Böhm summarises all the data he has collected. The powerful emission of light from the alkaline earths and magnesia has been long known, and the attempt has frequently been made to use them in arc lamps, the most successful application being in the Jablokoff candle. The endeavour to meet the competition of the incandescent gas lamp has, however, led to some very important developments on the part of Auer and others. These new glow lamps consist essentially of a mixture of conductors of the first and second orders. A metallic conductor is necessary in order to make the filament conduct in the cold, but when it becomes hot the electrolytic conductor takes the bulk of the current. The first lamps were made by mixing oxides or salts with carbon powder, rubbing up to a paste, pressing into threads, and igniting them whilst embedded in charcoal dust. Vegetable fibres and colodion filaments were impregnated with salt solutions, or a central filament of carbon was surrounded with a coating of emissive oxides or metals. Then the endeavour was made to construct a central filament of a difficultly fusible metal, but Auer was the first to succeed with such brittle and infusible material as osmium, for instance. One of the difficulties in connection with these filaments with central conductors is that the current passing through has to be so intense in order to heat the surrounding coat that there is danger of volatilising the metal. The author concludes with some remarks upon flame arc lamps made by adding fluorspar and other mineral substances to the carbon pencils.

In the issue of October 19 there also appears an article by Dr. Franz Strunz, on the chemical ideas in the writings of Plato. Recent discoveries have turned the attention of scientists to the consideration of the nature and constitution of the atoms themselves, instead of being content with the investigation of matter as composed of molecules and atoms. As so often happens, these new ideas are to a great extent a renewal of very old ones, especially of those put forward by the Greek philosophers. The world as conceived by Plato and set forth in his "Timæos" is not eternal, but was created at the beginning of time, and constructed in accordance with a conception of the creator. There is only one world, not several independent ones. The permanent material substratum of the elements (original matter) is devoid of form or qualities. Matter or space is something which exists with God, and is undetermined, shapeless, and unlimited, and before the creation of the world was formless and unmeasured. It cannot be comprehended, either by the mind or consciousness. As matter assumed form and order, the four elements arose. Matter is therefore the material foundation, which, always undergoing change, can become anything, and, therefore, forms the substratum of all the elements and remains present in all their variations, just as unlimited space comprehends everything. That which has been evolved should, however, be material, visible, and tangible. But without fire nothing is visible, and without earth nothing tangible. The Creator therefore made everything from fire and earth. As, however, two cannot be joined together without a third to form the connecting link, the Creator added air and water. Many details of the working out of these fundamental ideas will be found in the article.

The same issue contains a report of the proceedings of the 14th International Congress for Hygiene and Demography, which was held at Berlin from September 23 to 29. Amongst the subjects discussed was poisoning by lead compounds and other substances used in industrial processes. Teleky, speaking upon the phosphorus question, stated that in Austria in the years 1896 to 1905 he had been able to discover 277 cases of phosphor necrosis, and there were probably 350 to 400 cases altogether, although only 71 cases were mentioned in the reports of the inspectors. He thinks that the statistics of other States are also incorrect. He considers that the disease is not a local one, but that it affects the whole of the bones, causing spontaneous fractures. He is in favour of the total prohibition of the use of white phosphorus. Other subjects dealt with at the Congress were poisionng by manganese compounds in the Weldon process, and by mercury compounds in the preparation of furs.

In the issue of October 23, W. Kerp writes on sulphurous acid in food stuffs. This material is now used in large quantities for treating foods and drinks, and is employed for two different purposes: for destroying micro-organisms; and for bleaching wines, preserved fruits, meat, and many other products. Having made the observation that sulphurous acid remains unchanged in food for years, the author, together with others at the Imperial Health Office, has made an investigation of the condition in which it exists in it. The conclusion arrived at was that in wine the sulphurous acid is combined with acetaldehyde, in fruit with glucose, and in other foods with substances of the nature of an aldehyde or ketone. These addition compounds, however, possess very different degrees of stability; the glucose compound, for instance, decomposes very readily into its proximate constituents, and the acetaldehyde compound only very slowly. Experiments on animals were quite in accordance with this, for whereas it took 1½ grammes of SO_2 as formaldehyde sodium sulphite to kill a canary, when introduced as the corresponding glucose compound a third of a gramme was enough. In the presence of mineral acid the sulphurous compounds are not so poisonous.

In the issue of October 1 there is a description of a furnace devised by Moore and Heskett for the treatment of iron ore and the production of iron and steel from it. The furnace has a removable hearth on wheels, and is heated by means of producer-gas. The regenerative principle is made use of to economise the heat. It is not stated whether the furnace has been given an actual trial.

In the same issue the publishers of the *Zeitschrift* offer prizes for papers on the following subjects:—Apparatus for simple and fractional distillation in high vacuum; arrangement for separating solid suspended matter from liquids; plant for stirring liquids with air; and a paper on any subject connected with chemical plant and apparatus. The prizes offered are 300 marks (£15) for each subject.

In the *Elektrochemische Zeitschrift* for October there are instalments of papers on the following subjects. The electrolytic precipitation of zinc by the use of rotating electrodes, by T. S. Price; the distribution of the current in accumulators, by H. Herkenrath; and the preparation of compounds of nitrogen and oxygen from atmospheric air by electrical means by B. Springfeldt.

Analytical Notes.

THE TITRATION OF ZINC IN ALKALINE SOLUTION.

By Edgar B. Van Osdel.

Some time ago I made some comment upon experiences in the titration of zinc by potassium ferrocyanide in ammoniacal solution, keeping iron in solution by means of tartaric acid or a tartrate, and using the iron as an indicator with acetic acid upon the spot plate. Ores containing large percentages of iron, however, are not suitable for such treatment, since the dirty colour produced by the acidification on the spot plate masks the faint end-reaction of prussian blue. To remove the iron the standard method by Low may be employed, evaporating to dryness with potassium chlorate and nitric acid, diluting with, and after filtration washing with, solution of ammonium chloride and ammonia.

Instead, however, of acidifying, boiling to decompose chlorate, and double neutralisation before titration, we may proceed at once to titration in alkaline solution by simply dissolving a small quantity of ferric chloride in the acetic acid used upon the spot plate. The solution must be distinctly ammoniacal, but not excessively so. If the solution to be titrated is too nearly neutral the end reaction lacks sharpness, and if too strongly alkaline the zinc is not precipitated. If a solution of 100c.c. ammonia and 100 grammes ammonium chloride to the litre is used for dilution and washing, the titration will be satisfactory. Small variations in the amount of ammonia do not affect the standard, and if decomposing containers are filled to a certain depth, and similar conditions observed in washing, the results will be uniform.

An outline of the process, which is a modification of Low's standard method follows:—One-half or one gramme of ore is decomposed with 10 to 15 c.c. nitric acid, preferably in an

Digitized by Google

Erlenmeyer flask of Low's special funnel-neck form, and as soon as red fumes cease to appear, 10 grammes potassium chlorate are added. A convenient method of doing this is to use an annealing cup, size B, which has been made into a dipper by the addition of a handle of stiff wire. When shaken down level this holds almost exactly 10 grammes, and its contents may be quickly and easily transferred to the flask. More or less of the chlorate does not affect the result.

The contents of the flask are boiled to dryness, cooled, and a certain amount, 25 or 35 c.c., of the zinc wash added. The wash contains 100 c.c. ammonia and 100 grammes ammonium chloride to the litre. The flask is returned to the bath, its contents brought to a boil and poured upon the filter, catching the filtrate in an 8 oz. beaker. The flask is rinsed three times with as little hot water as possible, using the mouthpiece of the wash bottle for its delivery. When this has run through, the precipitate is washed twice with hot zinc wash from a wash bottle, using enough to fill the paper to a depth of about one inch above the point. When this has run through, a third wash of hot water, again using the wash bottle inverted, is used. After the filter has drained and the filtrate has been heated to boiling, it is ready for titration.

The solution should be divided as usual, and after the end point is passed, all of the other half is added except enough to require 1 c.c. for titration. The standard solution may then be added 1 c.c. at a time until the end point is again passed, when the whole is returned to the original beaker and finished carefully, 0.1 c.c. at a time. A light blue colour appears instantly with two drops excess.

The indicator is prepared by adding to glacial acetic acid a few cubic centimetres of solution of ferric chloride. The colour must not be strong enough to mask the end reaction, but should be sufficient to obscure any bluish tinge produced by copper in solution.

Each depression of the spot plate should contain 0.3 or 0.4 c.c. of the indicator to ensure acidity when 1 or 2 c.c. of the solution is withdrawn with a hollow rod. The ordinary spot plates have too shallow depressions. A convenient one is made by pouring melted paraffin into a cigar box to a depth of 0.5 to 0.75 in., and cooling as rapidly as possible to produce a uniformly white colour. When cold, depressions of any desired depth can be bored with a small spatula.

Since copper is not precipitated in ammoniacal solution when potassium chlorate and zinc salts are present, its removal is unnecessary. In any event the addition of a small amount of potassium hydrate would absolutely prevent interference.

If all solutions and wash water are hot, a run of zinc determinations can be made in an hour. In order for the standard solution to equal 1% for each cubic centimetre it should contain 66 grammes to the litre.

Tests have been made with a view to using uranium acetate in acetic acid as an indicator, but without success.—*Engineering and Mining Journal.*

Artificial Fertilisers in Russia.—H. M. Consul-General at Odessa, writing in regard to the use of artificial fertilisers in Russia, states that phosphates are very largely produced in the country from ground coprolites. They are manufactured into superphosphates, chiefly in the Baltic provinces and near Moscow. The high import duty continues to discourage the formerly large import of British superphosphates. The local product is mostly manufactured by Germans established in Russia. A certain quantity of Russian phosphate was formerly exported from Odessa, but the superior richness of the Algerian phosphates and their greater solubility in sulphuric acid have caused them to displace the Russian product. Vast beds of coprolites have long been known to exist in Central Russia and in the Dniester Basin. Estimates as to the quantities existing in the Dniester Basin alone have ranged as high as 1,700,000,000 poods (over 27,000,000 tons), but such computations are largely guesswork. Between 1886 and 1901 an export duty was imposed on coprolites. In the latter year the deposits were considered limitless, and the export duty was remitted. But recently the increased internal demand for superphosphates (chiefly for beet cultivation) and a lower estimate of the deposits have led the Kiev Agricultural Society to petition for a re-imposition of the export duty at 18c. per pood (£1. 3s. 7½d. per ton). British basic slag or Thomas slag was formerly an important import into Russia. It is now manufactured in vast quantities by a German firm at Taganrog, and at Sartana in the Taurida Government.

RADIUM.

At the last meeting of the Manchester Literary and Philosophical Society two papers on radium were read, the first by Dr. Henry Wilde, F.R.S., whose subject was the atomic weight of radium, and the second by Professor E. Rutherford, F.R.S., who gave an account of recent work on its origin and production. The occurrence of radium always in association with uranium, and in a definite proportion, pointed to a state of equilibrium between the two elements having been reached during geological time. With the object of determining whether uranium was the parent form, samples had been prepared altogether free from radium, but the most careful tests by Professor Soddy showed that the rate of production of radium was many times smaller than that indicated by theory. There remained the possibility, however, that radium owed its birth to some intermediate element, whose existence had been the object of search by Dr. Boltwood and Professor Rutherford. The former had at first attempted to show that this intermediate form was actinium, but Professor Rutherford had all along dissented from this view. Specimens of actinium had been prepared of various strengths, as measured by the electroscope, which showed that the formation of radium did not proceed as it should have done, according to this hypothesis. Moreover, Dr. Boltwood had, by chemical means, obtained a product intermediate between radium and uranium X—the first product of the disintegration of the latter—which was in many respects like thorium, but yet not identical with it. The supposition was, accordingly, that if actinium was a disintegration product of uranium, it was not in the direct line of descent, but branched off at some point hitherto not determined. The existence of such a body being postulated, it could be reconciled with all the observed facts with regard to the production of radium, and Dr. Rutherford incidentally described a means of determining the period of its existence before it changed into the next succeeding form. He was inclined to fix 2,000 years as the limit, though other authorities had estimated it at no more than 250 years. The form of electroscope used in making these determinations was described, and it was stated that one million millionth of a gramme of radium could just be detected by its means, and ten times that amount estimated with some degree of confidence.

PETROLLUM IN ROUMANIA.

In his report on the exportation from Roumania of petroleum and its products, Mr. H. G. Knowles, the American Minister at Bucharest, states that exports amounted in 1904 to 49,004,281 gallons; in 1905 to 65,514,067 gallons, an increase of 33%, and in 1906 to 97,587,155 gallons an increase of 50% over the previous year, and nearly 100% over 1904. There was comparatively little increase in the exportation of crude oil in 1905 and 1906 over 1904, and it has been the refined or illuminating oil and gasoline that has raised the exports in such great and rapid proportion. The exportation is to England, which takes 28%, France 27%, Germany 11%, Turkey 7%, Austria-Hungary 5%, and Bulgaria, Servia, and Norway together 3%.

The petroleum industry in Roumania is yet in its infancy, but the Government now realises that its petroleum is one of its most valuable products and assets. Unlike agricultural crops, the oil supply seems not only inexhaustible, but the yield is to be depended upon. The Government has recently adopted a policy of liberality toward the development of the country's youngest and most promising industry. Large appropriations have been made to improve the facilities for shipping oil from Constantza, the principal port of Roumania on the Black Sea, and from which was shipped in 1906 77% of the total exportation of petroleum. The transportation of petroleum from the oil fields and refineries has been mostly by railroad tank cars. This has been slow, expensive, and inadequate, hence the Government, to aid in the development of the oil industry, proposes to construct a new and large pipe line from the most distant oil section to Constantza, a line distance of about 220 miles.

Pyrites in Spain.—The pyrites mines near Ferrol, Spain, are reported to have been acquired by a French company for £10,000. It is also reported that an English company contemplates working several of the old copper mines in the district.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

A Process of Liquefying Air and Winning Oxygen. R. Mewes, 14, Pritzwalkerstrasse Berlin British Patent, 21,780/1906. Date claimed under International Convention, October 3, 1905

This invention has for its object a process of liquefying air and separating gases with a partial rewinning of the energy consumed by the compression. It differs from older and similar processes in this respect, that for the purpose of increasing the lowering of the pressure behind the expansion chamber in the exhaust port of the expansion engines (piston engines, Laval or Parsons turbines or the like) the expanded gases are not sucked off by the compressor, but by a special device (suction pump or the like), while a vacuum is produced, in order not to let cold expanded gases re-enter into the compressor, but to drive them out into the open air after using them as far as possible as a cooling medium for the process itself, in order to obtain in this way a mixture of fluids rich in oxygen. This is facilitated by not sending back the expanded gases into the circuit, but by driving them out after an almost perfect exchange of heat has taken place.

The present invention is an improvement on the invention described in the inventor's former Patent Specification No. 24,144 of 1905, wherein compressed air was caused to stream into an artificially maintained vacuum for the purpose of lowering the temperature and afterwards conducted into the atmosphere. According to the present invention the air is expanded in a cylinder behind a piston and exhausted into a chamber the pressure in which is below atmospheric, this chamber having its temperature lowered by the exhaust and constituting an effective cooler for the air to be liquefied.

The new technical effects claimed over older processes for liquefying air in which the expanded gases, after having done their work, are led off under atmospheric pressure, consist in the first place that, in consequence of the greater lowering of the pressure the falling of the temperature is correspondingly greater, that secondly the engine is not stopped as is the case with Siemens and other similar devices by a great lowering of the temperature, but, thirdly, also that the liquefied gases, which are partly evaporated again in the process itself, are evaporated at a suitably reduced pressure of less than one atmosphere, and in quantities corresponding with the vapour pressures of the component parts of the mixture of fluids. For instance, as experiments by Dewar, Estreicher, Baile, Olszewski have shown, (conf. *Zeitschrift fur komprimierte und flussige Gase*, 2nd year, number 12, page 166) nitrogen has at 105 degrees a vapour tension of 740 mm., oxygen a tension of 142 mm. By producing a reduced pressure above a fluid the temperature is at once lowered, if not sufficient heat is admitted for the evaporation of the quantities of fluids sucked off. It is evident that,—as in the present process the temperature, by producing a reduced pressure by means of a suction pump, can easily be lowered down to -200° or still further, and as at these temperatures the proportion of the vapours of both fluid parts is greater than 740 : 142, therefore greater than 5—it is necessary to evaporate over five times as much nitrogen as oxygen. This proportion becomes greater with the lowering of the temperature and is according to Olszewski at -214° 60, 3.6, or 16. By producing a vacuum of 60 mm., which is technically easy, 16 times as much nitrogen as oxygen will be evaporated, therefore almost only nitrogen.

The process is therefore suited for winning directly almost pure liquid oxygen, and by its distillation correspondingly pure gaseous oxygen.

The inventor claims :—(1.) In a process of liquefying air and winning oxygen with a partial recovery of the energy expended wherein the expanded gases are conducted into the atmosphere, expanding the gases in a cylinder which exhausts into a chamber used as a cooling chamber from which the said gases are discharged into the atmosphere by means of a pump or the like. (2.) A device for carrying out the process according to Claim (1), the essential feature of which is that to the exhaust pipe of the engine for expanding the compressed gases a suction-pump, or the like, is connected.

Improvements in or Relating to Saturators for Use in the Manufacture of Sulphate of Ammonia. P. E. Williams, 86, Poppleton-road, Leytonstone, Essex, and R. L. Fenner, 1, Coleraine-road, Blackheath, Kent. British Patent, 25,547. November 13, 1906.

The claiming clause of this specification is :—"The improvement in or relating to saturators for use in the manufacture of sulphate of ammonia which consists in fixing a distributing pipe externally to the saturator and connecting it thereto by lengths of pipe so as to enable the sulphate to be made equally in all parts of the acid liquor and to prevent the formation of incrustations or deposits of hard salt."

Improved Manufacture of Sodium Alum, Potassium Alum, or Ammonium Alum free from Iron and in Small Crystals. Strohbach, Neidersedleitz-Dresden, Germany. British Patent, 28,581. December 14, 1906.

The full text of this specification will be found on p. 422 of this issue.

Improvements in and in the Preparation of Explosives. The King's Norton Metal Co., Ltd., 16, Great George-street, London, S.W., T. A Bayliss, Managing Director of the King's Norton Metal Co., Ltd., H. Melville Smith, of Hill Top, Abbey Wood, Kent, and H. W. Brownsdon, Analytical Chemist to the King's Norton Metal Co., Ltd. British Patent, 28,053 Dec. 10, 1906.

The claims of this specification are :—(1.) The improvement in explosives hereinbefore described, the said improvement consisting in coating or covering the grains or particles of the explosive with a metal, preferably aluminium in fine powder. (2.) The improvements in the preparation of explosives of the kind claimed in the prior claim, the said preparation consisting in first treating the fine metallic powder with a small quantity of oil, vaseline or the like and afterwards intimately mixing the oiled metallic powder with the explosive.

MAGNESIA CLAY IN ITALY.—According to a United States Consular report, Italy produces annually about 1,800 tons of sulphate of magnesium, 600 tons of calcined magnesia, and 625 tons of magnesite. The Kingdom exports some 850 tons of sulphate of magnesium, and imports 950 tons of chloride of magnesium, exporting about one-half of the latter amount. The domestic production appears to suffice for the home consumption, and is apt to be increased according to necessities. Italy would not seem to offer a market for similar foreign products.

SICILIAN SULPHUR.—The exports of sulphur from Sicily amounted last year to 17,500 tons, a decline of 23,200 compared with 1905, says the American Consul at Palermo. His report continues :—"The obligatory syndicate for the control of the entire industry of the island was constituted by the Italian Government on August 1 last, and it was to this body that the Anglo-Sicilian Sulphur Company had to sell its stock of sulphur at a price involving a loss to the company of $1,450,000. The great problem the syndicate has to face is the competition of the United States, an extraordinary development of the sulphur mines of Louisiana having occurred in recent years. Thus America, which at one time took a large proportion of the Sicilian output, now imports very little. The Italian Government sent two official missions to Louisiana to see what was being accomplished there, and how it was done. The new syndicate has taken over some 350,000 tons of the stocks of the Anglo-Sicilian Sulphur Company ; it has to cope with an excess production of about 10% above the world's consumption, and also the practical loss of the United States market, which consumed about one-fifth of the total exports. These are conditions serious enough of themselves, besides having to grapple with the limitation of mining operations and consequent unemployment."

Market Reports.

THE AMERICAN CHEMICAL MARKET.

NEW YORK, October 22nd, 1907.

(Rate of Exchange, $4.86½ = £1.)

Nitrate of soda remains dull at $2.40. per 100 lbs. Sulphate of ammonia is slow of sale, and is quoted at $3.05 per 100 lbs. Grey muriate for galvanising is moving in usual consuming channels at 6c. to 6¼c. per lb. White muriate for electrical purposes is slow, at 5⅞c. to 6c. per lb., as to make. Lump sal ammoniac is steady at 9¼c. per lb. Lump carbonate ammonia ranges from 7⅝c. to 8c. per lb. Bleaching powders are in rather plentiful supply, ranging in price from $1.15. to $1.25. as to make and test. Alkali is quoted at 92½c. per 100 lbs., for light 58% in bags, f.o.r. works, and caustic soda, 74%, is $2.10. Sulphate of copper is quoted at 5½c. per lb. by the syndicate, while outside makers are shading this figure a trifle. White powdered arsenic is dull, but firm and steady at 6⅞c. to 7c. per lb., for spot, and 6¾c. to 6¾c. per lb., for futures. Red Saxony arsenic is unchanged at 7½c. per lb. Carbonate of potash, calcined 80-85%, is 3¾c. per lb., and hydrated is 4¼c. to 4½c. per lb. Caustic potash, 75%, is 4½c. per lb. Chlorates are steady at 8¼c. to 8¾c. per lb., for soda and potash respectively, for prompt shipment f.o.r. works, and next year's prices have been fixed on the same basis. Bichromate of potash is 8¼c., and soda is 7½c. per lb. Prussiate of potash is dull and lower, at 15½c. per lb., and soda slow at 9c. per lb. Oxalic acid is in more plentiful supply, and is offered at 7¾c. to 8c. per lb., as to make, for prompt, while futures are quoted at 7½d. per lb. for next year's delivery. Antimony products continue to weaken and oxide to-day is worth on spot 10½c. per lb., while needle may be had at 7c. per lb.

THE INDIAN CHEMICAL MARKET.

Market movements (Calcutta, 3rd October) are reported as under:—

Borax: Owing to paucity of supplies and very light stocks, sales have been much retarded; rates, Rs.15.0 to Rs.15.8. per bazaar maund, weight loose. Saltpetre (season, September to June): Market quiet, with prices well maintained owing to reduced supplies and very moderate stocks; quotations, Rs.8.2. to Rs.8.10. for Furrackabad refined kinds, and Rs.7.12. to Rs.7.14. for ordinary 5% retraction quality, per factory maund, weight, loose, for delivery this month; 10% refraction quality, quoted Rs.7.0.; 15 to 20% refraction quality, Rs.6.4.; and 15 to 30% refraction quality, Rs.5.12., per factory maund, weight, loose, for near and early deliveries. Castor oil cake continues in fair demand, and as deliveries have overtaken supplies, the market is very firm; export rates are Rs.6.14. to Rs.7.0. for average, and Rs.7.4. for picked quality, per bag of 2 maunds, packed in single gunny, f.o.b. for near and early shipments; unsold stocks are light. Bone meal: Market continues very steady at Rs.73.0. for New Zealand quality, Rs.68.0. for usual standard quality, and Rs.61.0. for usual standard of unsteamed quality, per ton of 20 cwts., f.o.b., packed in new single A twill bags of 200 lbs. each, for near and near forward shipments, guaranteed 4½% ammonia and 52% tribasic phosphate of lime. Bone dust: Prices, Rs.52.0. for steamed, and Rs.50.0. for unsteamed quality of inferior analysis, per ton, f.o.b., for short date delivery; offerings of this grade are small. Castor oil: Owing to short supply of castor seed, quotations are Rs.19.8½. for No. 1 fine pale, Rs.14.8½. for good seconds, and Rs.13.14½. for thirds in cases, per bazaar maund, weight, f.o.b., for prompt shipment; local demand has been supporting prices. Stocks and supplies continue small. Cocoanut oil: Owing to increased arrivals the market is declining; stocks of lower grades are being accumulated; for export sales are few, at Rs.20.0. to Rs.20.4. per bazaar maund, weight, f.o.b., in cases, for near and near forward shipments. Salt: The market continues steady; local stocks held, in maund weights, were: Ex Liverpool 408,350, Hamburg 654,703, Aden 275,384, Saliff 63,913, Phocee 145,437, Spanish 190,579, Port Said 147,249, and Bombay 21,543; quotations per maund were: Liverpool, Rs.47.0. to Rs.51.0. Hamburg, Rs.42.0. to Rs.48.0.; Aden, Rs.44.0. to Rs.50.0.; Saliff, Rs.45.0. to Rs.60.0.; Phocee, Rs.48.0. to Rs.50.0.; Spanish, Rs.46.0. to Rs.54.0.; Port Said, Rs.47.0. to Rs.50.0.; and Bombay, Rs.48.0. to Rs.50.0.

TAR AND AMMONIA PRODUCTS.

THURSDAY.

Benzols very quiet, with quotations given at 8¾d. to 9d. for 90's, and 8¾d. for 50-90's, casks included. Crude tar, 14s. 6d. to 18s. 6d. per ton, Thames; 1⅛d. to 1⅜d. per gallon, delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 24s. 3d. to 24s. 9d., f.o.b.; Gas Company, 26s. 6d.; East Coast, 23s. 3d. to 23s. 9d.; West Coast, 22s. 6d. to 23s. 6d. Refined naphthalene, £6. 10s. to £8. 10s., packages included. Toluol 90%, 10d. to 10½d.; pure, 1s. 1d., casks included. Carbolic acid, crude, 50%, 1s. 5d. to 1s. 5½d.; 60%, 1s. 7¾d. to 1s. 8d.; 75%, 1s. 11¾d., casks included. Crystals, 39-40, 5¼d.; 34-35, 4⅝d. to 5d. Cresylic, 95%, 1s. 1d. to 1s. 1½d. Anthracene, 40 to 45 per cent A, 1¾d., casks included. Pyridin, 4s. to 4s. 3d.

Sulphate of ammonia firm and in good demand. Nearest values are:—Beckton, to end of year, £12. 5s. to £12. 7s. 6d.; next year, £12. 7s. 6d. to £12. 10s.; Beckton terms, £12. 2s. 6d.; London, £11. 18s. 9d. to £12.; Hull, £12. 2s. 6d.; Liverpool, £12. 2s. 6d. to £12. 3s. 9d.; Manchester, £12.; Leith, this year, £12. 5s. to £12. 6s. 3d.; next year, £12. 7s. 6d. to £12. 10s.

Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 9d.; Liverpool, ordinary, 11s. 2½d., and refined, 11s. 3d. Official quotations:—Cargoes, off coast or due, 10s. 10½d.; ditto for prompt shipment, 11s. 1½d.

THE LONDON METAL MARKETS.

WEDNESDAY.

Copper: Standard brands, £63. 12s. 6d. to £63. 17s. 6d. cash, and £63. to £63. 5s. three months. Tin: G.M. quality, £138 15s. to £139. 5s. cash, and £141. to £141. 10s. three months; English, £143. Lead: Soft foreign, October, £18. 5s.; November, £18.; December, £18.; February, £17. 15s.; English, £18. 10s. to £18. 12s. 6d. Spelter: Ordinary brands, November, £21. 15s.; December, £21. 15s.; January-February, £21. 12s. 6d., ex ship; hard, £18. 10s., f.o.b. Antimony, £40. to £42.; crude, £27. 10s. c.i.f.; ore, £12. to £13. Bismuth, 6s. 6d. Quicksilver, £8. 5s.; seconds, £8. 3s. 9d. Nickel, 1s. 10d. per lb. Aluminium, £110. to £115. Wolfram, 38s. to 40s. Pig-iron closing prices: Cleveland, 49s. 10d. cash; 49s. 10½d. one month; 50s. three months.

FERTILISER MATERIALS.

THURSDAY.

Whilst demand for ammoniacal materail has been good, phosphatic material is not attracting attention.

High grade mineral phosphates are offered more freely at a decline on last prices, but 58-63% grades are unchanged.

Quotations for East Indian bone meal for shipment have been advanced; shippers now require £4. 18s. 9d. per ton, nett, c.i.f. terms, Liverpool, 4½ and 52% quality; on spot, £5. 5s. to £5. 10s. per ton, according to quality, ex store, is asked.

Nitrate of soda is easier on spot, the quotations now being 11s. 1½d. per cwt. for 95%, and 11s. 3d. per cwt. for refined quality, ex store.

MISCELLANEOUS CHEMICAL MARKET.

THURSDAY.

Upon the whole business seems to be rather quieter, though there is a fair amount of business in progress for supplies during the coming year, and prices are well maintained. In the alkali trade there have been no movements of any particular consequence during the week. Bleaching powder remains steady at £4. 7s. 6d., f.o.r. Caustic soda, £10. 5s. per ton for 70%, f.o.b. Liverpool, with usual 5s. rebate for contracts over 1908. Ammonia alkali is steady, and firm at £4. 10s., bags, f.o.r. Soda crystals, 55s. to 57s. 6d. per ton, in bags, f.o.r. Chlorates are unchanged at 3½d. Saltcake is firm: a fair amount of business has been done forward for next year at 42s. 6d. per ton, in bulk, carriage paid. Sulphur remains unaltered at £4. 12s. 6d. For sulphate of copper the present quotation is £24., f.o.b. Acetates of lime continue steady in value. Acetic acid and other acetates are more freely offered, and prices on the whole are steady at former quotations. Prussiates are firm, soda at 3¾d., and potash 5⅞d. to 6d. White powdered arsenic is steady at £29. 10s. for best Cornish makes, and other makes at £28. 10s. Green copperas continues scarce, and price is unaltered. Ammonia and ammonia salts are in good general demand, and values are well maintained.

LIVERPOOL OIL AND COLOUR MARKET.

THURSDAY.

OILS.—Palm oil in greater demand, sales including soft oils at £28. 2s. 6d., and Old Calabar at £28. 5s. to £28. 7s. 6d., both for November-December delivery, with Lagos retail lots on spot, £31. 5s. per ton, all in transit. Linseed oil quiet, at 25s. 9d. to 27s. per cwt., for Liverpool makes in export casks. Cottonseed oil steady, with quotations given at 26s. to 27s. per cwt., for Liverpool refined in export barrels. Tallow quiet. Turpentine dull, at 37s. 3d. per cwt. for spot parcels. Petroleum in fair demand, at 7d. for Russian and Roumanian, and 7½d. to 8½d. per gallon for American refined oils. Petroleum spirit steady, at 1s. 1½d. to 1s. 3d. per gallon.

LIVERPOOL DRYSALTERIES.

THURSDAY.

Montreal potashes and peral ash nominal, pending fresh arrivals. Bark quiet at recent quotations. Logwood is in little demand, but market maintained at previous quotations. Cutch unchanged in prices, but with a moderate enquiry. Gum: A continued steady tone prevails, but little business is passing. Gambier: Block, 23s. to 23s. 6d. on spot; November-December shipment 20s., and 19s. 9d. for December-January shipment. Cubes, 30s. to 30s. 6d. on spot; October-November and Novemb ber-December shipments, 28s. per cwt. Shellac: Sales restricted, with little business passing, and quotations given for fair to good TN orange at 130s. to 135s. on spot, and nominally for December-January, 97s. 6d., c.i.f., for shipment. Glucose firm: American liquid, 43%, 12s. 6d. on spot, and 12s. for October-December delivery; for prompt shipment, 10s. 1½d., and for October-December, 9s. 7½d., c.i.f., for shipment. American powdered starch, 11s. on spot, and 10s. 6d., c.i.f., for shipment. Pearl, 10s. 7½d. on spot, and 10s., c.i.f., for shipment. Cream of tartar, 98% foreign powder, 88s. to 89s.; 95%, 86s. to 87s. Tartaric acid: English, 11½d. on spot, and foreign, 11d. Citric acid: English, 1s. 9d.; foreign, 1s. 9d.

HULL PAINT, OIL, AND COLOUR REPORT.

WEDNESDAY.

OIL.—The imports of seed have been on a liberal scale, but whether this has the most influence on the market or the present monetary stringency it would be difficult to explain, yet markets for seed oils have been receding all the week. Linseed oil has fallen during the week 25s. per ton, and refined cotton oil 10s. per ton. Turpentine also is lower, which is most directly attributable to the American monetary position. Amongst the principal imports here to date, against the same time a year ago, are:—Wheat, 3,540,237 qrs., against 3,277,971 qrs. Flour, 178,916 cwts., against 300,073 cwts.; linseed, 686,281 qrs., against 499,356 qrs.; rapeseed, 99,763 qrs., against 102,802 qrs.; cottonseed, Egyptian, 144,419 tons, against 131,367 tons, other kinds 149,343 tons, against 105,958 tons; oilcake, 21,857 tons, against 34,999 tons; hemp, 112,917 cwts., against 138,065 cwts.; olive oil, 3,682 tuns, against 3,370 tuns; tar, 14,604 barrels, against 11,199 barrels. Amongst the weekly imports are:—Margarine, 2,991 cwts.; lard, 3,989 cwts.; sugar, 21,876 cwts.; glucose, 20 cwts.; colours, 2,274 packages; wool, 247,464 lbs.; hides, 1,062 cwts.; oilcake, 4,019 tons. Exports:—Oil, 9,973 cwts.; colours, 2,314 packages; chemicals, 2,109 packages. Refined cotton oil closes quiet, spot, naked 22s. 3d.; November-April, 22s. 6d.; casks £1., and barrels £1. 7s. 6d. per ton. Exports for the week:—6 tons France, 29 France, 10 Holland, 3 Norway, 8 Sweden; total 56 tons. Linseed oil, spot, naked 23s. 1½d., November-December 23s. 1½d., January-April 22s. 3d.; boiled and refined, £1. and £1. 10s. per ton extra. Exports during the week:—2 tons Denmark, 2 Egypt, 22 Germany, 5 Norway; total 31 tons. Olive oil, Levant, on the spot £41. Castor oil, November-December £31., January-June £30. 10s., July-December £30. 5s. Turpentine quiet, 37s. spot, December 37s. 3d., January-April 38s. 3d., May-June 38s. 3d.; Russian 20s. 9d. Rosins quiet and dull.

CAKES.—Linseed quiet, foreign makes scarce. Cotton, best, spot at £5, December-April advanced to £5. Bombay, £4 5s.; December-January advanced to £4. 10s., February-April unchanged.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, THURSDAY.

Except in the covering of forward lots there is comparative quietness in the movement of sulphate of ammonia, new business being small of volume, but value remains steady at about £12. 5s. prompt, f.o.b. Leith. So far as forward dealing is concerned, there has been no actual renewal of movement; makers are said to be looking for £12. 7s. 6d., Leith and Glasgow. Nitrate of soda has dropped a fraction. Sulphate of copper continues under the influence of the vagaries of the metal. The market in the ordinary chemicals has felt in some measure the effects of the United States financial tumult, but on the whole its stability is fairly well held, and prices for the most part are maintained. Scotch calico printing works are still in short work, some being down to three days a week, and the dye works are also indifferently supplied with orders. Colour chemicals, and drysalteries generally, are a shade easier on the market.

Chief prices current are:—Alum (in lump), £5. 5s. to £6., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 15s. to £5., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3½d., nett, Glasgow; creosote (ordinary coal-tar and blast furnace) 2¼d. to 2½d., naked, f.a.s. Glasgow; nitrate of soda, 11s. 3d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2⅜d. to 2½d. per lb.; paraffin wax, 120°, semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¾d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating) 865°, £5. 15s. to £6. 5s.; 885°, £6. 15s. to £7.; 890-895°, £7. 10s. to £8.; prussiate of potash, 5⅞d. to 5¾d., nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £2. 17s. 6d. to £3.; sulphate of ammonia, £12. 5s., prompt, f.o.b. Leith; sulphate of copper, £22. less 5% Liverpool, prompt.

TYNE CHEMICAL REPORT.

WEDNESDAY.

Market steady, and shipments continue in good volume. Caustic soda firm at £11. for 76-77% and £10. 5s. per ton for 70%. Bleaching steady at £5. to £5. 5s. per ton. Soda crystals locally quiet at £3. to £3. 2s. 6d. per ton, gross weights. Sulphur firm at £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £29. 10s. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—In the market here the position remains the same. Colliery turns are very full for November, and prices are steadily held for prompt and forward. Gas coals are in increasing demand, and steam coals are also very active for the time of the year. To-day's quotations:—Best Northumbrian steam, 15s. to 15s. 3d. per ton; second qualities, 14s. to 14s. 6d. per ton; small steam coals, 10s. 6d. per ton; best gas coals, 15s. to

Digitized by Google

15s. 6d. per ton; Durham bunker coals, 12s. 6d. to 13s. per ton; coking coals, 14s. per ton; household, 16s. 6d. to 17s. per ton; foundry coke, 22s. per ton; gas coke, 19s. 6d. per ton.

New Companies.

Anajas Rubber Syndicate, Ltd.—Capital £3,750., in 1s. shares. This company has been formed to carry on the business of planters, growers, curers, importers and exporters of and dealers in rubber, cacao, mandioca, coffee, tobacco and other products, etc. No initial public issue. Table A mainly applies.

Coke Ovens and By-Products Co., Ltd.—Capital £3,000., in £50. shares. This company has been formed to adopt an agreement with M. Duchanoy, G. Bousquet, and M. Davicion, all of Paris, and to carry on the business of manufacturers of and dealers in coke ovens, dealers in tar, oil, gas and bye-products from coal and cannel, etc. No initial public issue. The subscribers are to appoint the first directors.

Kalie-Baroe Planting Co., Ltd.—Capital £40,000., in £1. shares. This company has been formed to acquire the leases of and develop certain estates, lands or plantations at Kalie-Baroe and Tji-Gocha, in or near the Preanger Residencie, Java, to adopt an agreement with R. N. G. Bingley, J. H. Starey, and W. O. Burt, and to plant, grow, and produce tea, cinchona, quinine, camphor, coffee, indiarubber, gutta-percha, balata and other gums, cocoanuts and other natural products of any kind in Java or elsewhere. The first directors are J. H. Starey, H. J. Wenham, W. O. Burt, and G. M. Stuart. Qualification, 100 shares. Remuneration, £200. per annum and 5% of the net profits, divided. Registered office, 18, Laurence Poultney-lane, E.C.

London Asiatic Rubber and Produce Co., Ltd.—Capital £140,000., in £1. shares. This company has been formed to acquire the business of the Asiatic Rubber and Produce Co., Ltd., the registered office of which is in Colombo, with a view thereto to enter into an agreement with the said company, to acquire any lands or interest therein, or any other property or rights in the Federated Malay States, the Straits Settlements, or elsewhere, and to carry on the business of planters and manufacturers of and dealers in rubber, cocoanuts, tea, tapioca, coffee, cinchona, cacao, cardamomoms, and other natural products, etc. The first directors are C. A. Lampard, H. W. Brett, K. F. Arbuthnot, and C. D. Rotch. Qualification, £250. shares or stock. Remuneration, £100. each per annum. Registered office, 11, Idol-lane, E.C.

Magarini Valley Rubber Estates, Ltd.—Capital £3,500., in £50. shares. This company has been formed to carry on the business of planters, producers and growers of rubber, cotton and fibres, etc., and to adopt an agreement with G. Griffiths. No initial public issue. The first directors are G. Griffiths (managing director), I. Levi, W. Bottomley, and G. J. Garnett. Qualification £500. Remuneration, after aggregate dividends of 100% have been paid on the issued ordinary shares, £150. each per annum (managing director £250.) Registered office, 24, North John-street, Liverpool.

Marazion Mines, Ltd.—Capital £2,000., in 1s. shares. This company has been formed to acquire, develop, and turn to account any mines, mining rights and metalliferous land in Cornwall or elsewhere. No initial public issue. E. Melville is the first director. Qualification (except first director, who requires none) 100 shares. Registered office, Penzance, Cornwall.

Providence Tin Mines, Ltd.—Capital £100,000., in 10s. shares. This company has been formed to adopt an agreement with the Tasmanian Exploration Co., Ltd., to acquire any tin, copper, or other mines and mining rights or undertakings, to carry on the business of explorers, prospectors, miners, metallurgists, merchants and the like, to acquire by agreement or otherwise, such control over producers of tin, copper and other metals and minerals, and of articles manufactured therefrom, as may seem expedient, etc. No initial public issue. The first directors are to be appointed by the subscribers. Qualification of first directors, £200.; of others, £500. Remuneration (except managing director) £150. each per annum (£50. extra for the chairman) and 5% of the surplus net profits after 10% is paid on the shares, divided.

Silver-Lead Mines of Wales, Ltd.—Capital £4,000., in 10s. shares (7,000 preferred and 1,000 deferred). This company has been formed to carry on the business of lead and general miners, assayers, refiners, smelters, metallurgists, etc., and to adopt agreements (1) with the Welsh Copper Syndicate, Ltd., and (2) with F. de Bal. No initial public issue. The subscribers are to appoint the first directors. Qualification, 50 preferred shares. Remuneration, £30. each per annum (chairman £50.).

PRICES CURRENT.

FRIDAY, November 8, 1907.

PREPARED BY MESSRS. HIGGINBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified.
The price in different localities may vary.

		£	s.	d.	
Acids :—					
* Acetic, 25% and 40%	per cwt.	9/-	&	13/-	
* ,, Glacial	,,		40/-		
Arsenic S.G. 2,000°	,,		31/-		
* Fluoric	per lb.	0	0	4½

LATE ADVERTISEMENTS.

TENDER.

RADCLIFFE AND PILKINGTON GAS COMPANY.
SPENT OXIDE.

THE Directors of this Company invite Tenders for the purchase of about 150 tons (more or less) of Spent Oxide. Samples for testing may be taken from the heap by any intending purchaser, or will be sent together with particulars on application to the undersigned. Tenders will be received until Friday the 22nd inst.

Gas Work, Radcliffe, November 13th, 1907.
James Praddock, Manager and Secretary.

SALE BY AUCTION.

RE THE SCOTTISH CYANIDE CO., LTD., (IN LIQUIDATION).

On WEDNESDAY, 18th and THURSDAY, 19th DECEMBER, 1907, at the KIRKLAND WORKS, LEVEN, FIFESHIRE, highly important and extensive Sale of

THE WHOLE PLANT, MACHINERY, AND EFFECTS,

comprising:—4 sets of Willans and Robinson "3T" triple-expansion Engines, with 8 Mather and Platt low-tension Alternators. Each engine is capable of giving out 800 h.p with 160 lbs steam pressure. 2 Korting's ejector condensers; 15 electric furnaces; 2 large Dowson gas producers, with blovers; 6 benches of regenerative gas retorts; 10 multitubular Lancashire steam boilers, 28 feet by 8 feet, for 160 lbs. pressure; 2 Green's economisers, consisting of 832 tubes, 9 feet long; large lot of circular and other vats; Johnson's filter presses; Linde refrigerating plant, distillation plant; 2 Johnson's brickmaking machines; and miscellaneous effects, by Auction (To be sold by instructions of Robert B. Lawrie, Esq., Liquidator), J. & R. EDMISTON will Sell by Public Auction. Catalogues on application to the Autioneers, at their Offices, 7, West Nile-street, Glasgow.

IMPORT, Working and Representation of Chemical Products. Factory near Berlin (Germany), large producer of Sulphuric Acid, Acetic Acid, Wood Alcohol, Formaldehyde and Solvents, with rail and water accomodation, also extensive storing places, takes over working of Chemicals for Home Trade and Re-exportation, and also Sole agency of suitable articles.—Address Mr. Hugo Blank, Derfflingerstr. 15, Berlin, W. Correspondence in English, French or German.

CHARCOAL:—Flake and Sawdust Charcoal on Sale in large quantities.—Apply, "1,564," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

MANAGER Wanted for Glue Works in England. Must be up-to-date and capable of making first-class glue from bones and from skins.—Replies, treated confidentially, giving full particulars of experience, salary required, etc., to "Glue," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

CHEMICAL Plumber requires a Situation, experienced workman, good references.—"1,592," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

WANTED, Steam Exhauster to exhaust 10 to 12 thousand cubic feet per hour through 10 feet of water; send full particulars.—No. "1591," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

RESPONSIBLE position Wanted by gentleman with 15 years' experience in chemical trade; excellent book-keeper, knowledge of mercantile law, etc., and accustomed to control of office. First-class testimonials.—Box "1593," *Chemical Trade Journal*, Office, 265, Strand, London, W.C.

AGENCY.—Advertiser would like to Represent good provincial or foreign firm in London. Smart business man with excellent all-round experience in chemical trade, and well in with home and export buyers.—Apply Box "1,594," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

ANALYST required for accumulator works; must be well up in lead and acid analysis; one with a knowledge of electricity preferred; state age, experience and salary required to "X.Y.Z.," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

CURRENT TOPICS.

THE CRISIS IN THE MONEY MARKET.

AS briefly recorded in our last issue, the Bank of England's minimum rate of discount now stands at 7%, and the factors which have resulted in such an abnormal state of things call for something more than passing comment. The Bank rate has not reached such a high level since 1873, when, as at the present time, speculation in America was largely responsible for the creation of such a demand for gold that the rate rose to 9%. The fact that the rates of the Bank of France, the National Bank of Belgium, and the Imperial Bank of Germany have also been raised is in itself sufficient indication that the existing state of things is regarded as a crisis.

The situation in the United States is a difficult one to assess. According to the *Economist* the banking panic is leaving New York and spreading over the United States generally; the inference is, therefore, that the panic will spend itself after destroying many unsound institutions, but that a long period marked by general distress, unwillingness to lend, inability to borrow, and a scarcity of money often approaching a famine, is now before the people of the United States. It is generally agreed that the drain upon the New York gold reserve, which has in turn been communicated to this country, is to a large extent caused by the hoarding of gold. It is stated that for some time depositors have been withdrawing their money from the banks and have preferred to store it in safe deposits, with the result that the United States, at a time when there is more bullion in the country than usual, is now suffering from a cash famine. The consequence is that gold has reached a high premium, and wages are being paid in cheques and in various forms of unofficial paper money.

Digitized by Google

The New York *Nation* states that one of the causes for the present financial crisis in the States is what is known as the "chain banking system," which was initiated some six years ago, and which is described as a new order of things in American finance. Speculators bought a majority of shares in a trust bank, and thus secured control. Using the shares of this bank as security, they borrowed money, with which they obtained control of a second bank, and thus continued the process until, with a single outlay, they had secured the mastery of a chain of banks, the resources of which (exceeding by many times their own initial capital) they appropriated to the financing of their various speculative schemes. We are told that many operators of this kind were ruined by the great fall in copper, and the banks whose funds they had manipulated were wrecked in turn.

The situation in the States at the time of writing still remains uncertain. In a careful review of the whole situation, the *Financier and Bullionist* observes that financially, industrially, and politically, the whole country is passing through a period of trial and anxiety, and even the most far-seeing prophet cannot venture to predict the return to normal conditions of confidence and stability. Prominent New York bankers profess to believe that the worst is now over, but our financial contemporary points out that this opinion is not shared by other authorities throughout the country. From day to day fresh difficulties arise, and as every additional failure, whether of a bank or an industrial enterprise, increases the aggregate damage for which reparation or provision will ultimately have to be made, it is only natural that the future should be regarded with much misgiving. It is felt that the recent collapse will be the cause of a large amount of acute distress, which must be reflected in the future course of business of every description. The practical suspension of specie payments is a very serious matter, and must lead to embarrassing complications. Paper money (continues the *Financier*) may be an excellent medium when confidence is strong, but when credit breaks down, as it has recently done, the use of Clearing-House cheques or any other ingenious substitute for a State-guaranteed currency is calculated to provoke rather than to allay anxiety. The large issue of paper money is regarded with distrust, and complications containing all the germs of a fresh financial crisis may thus ensue.

The feeling in the country appears to be that the Government should take more vigorous and practical measures to restore confidence than those already adopted, and it is urged that the administration, in conjunction with the leading banks, should establish an effective control over and guarantee of the large issue of paper money now being made. Until this is done it is considered unreasonable to hope for any general recovery of confidence.

The prospect of a period of depression in the United States cannot be contemplated on this side with any satisfaction. The collapse has resulted in monetary troubles, of which this country has had to bear the brunt. The co-operation of the Bank of France has been secured to some extent—proving the international relations between the money markets of the world,—but, as is clearly shown by the *Financier and Bullionist* in the review to which we have already alluded, we have everything to lose, financially and commercially, by the prolongation of the crisis, and with the Bank Rate at 7% the situation cannot be regarded as other than serious. The influence of the high rate is now being felt in the slackening of the drain of gold from this country to America, and it is evident that the leading New York bankers are making a strenuous attempt to meet the situation. The immediate effect on American trade and industry cannot be otherwise than serious, but the recuperative powers of the country are phenomenal, and its future prosperity will be the more lasting because it will be founded on a firmer and more satisfactory financial system.

THE NITRATE POSITION.

A startling change has within the last few weeks come over the nitrate scene, and the condition of the market is probably causing its supporters more anxiety than at any time since the renewal of the "Combination" in April, 1906. Thanks to adroit manipulation, supplies in the consuming countries have hitherto been kept within bounds, but only at the expense of a steady accumulation of stocks in Chili; at the beginning of November these reached no less than 13,300,000 quintals or 600,000 tons, against 11,204,000 quintals last year, 9,220,000 in 1905, and 8,204,000 in 1904, three months' output being thus on hand, instead of the normal two.

This plethora of nitrate awaiting shipment was in itself a sufficiently disturbing factor, but matters have been brought to a climax by the financial crisis in Chili, due in great measure to the flotation, within the last three years, of countless companies for the exploitation of nitrate deposits. After long remaining indifferent to the industry which constitutes, in the shape of export duties, the principal item in the State revenues, the Chilians suddenly decided to claim a share in the enormous profits made by English, German, and Spanish producers. Native "oficinas" were erected right and left, without regard to scarcity of labour, dearth of water, and other difficulties; when these made themselves felt, many of the new concerns ran short of money, shareholders were unable to pay up their calls, and nitrate was forced on to the market, bringing down selling prices. Under ordinary circumstances these might have been supported by the European trade, deeply interested in the maintenance of values on account of previous large purchases, but unfortunately the financial crisis in the United States has intervened, with monetary stringency in Europe. Hamburg, the principal nitrate emporium, is particularly hard hit, and, instead of coming to the rescue, has been obliged to lighten its load, the carrying of large stocks on money borrowed at 10% being a ruinous proceeding. Such is the genesis of the existing *malaise* in nitrate circles.

There is no occasion at this time of the year to enter into elaborate statistical details, or to attempt to forecast the course of events next spring, but a few general data may not be altogether devoid of interest. The "visible supply" for Europe on the 1st inst. was, as stated in our last issue, 786,260 tons, of which 323,860 tons were afloat and 162,400 tons instore at the different ports, the latter figure comparing with 123,280 tons a year ago and 115,070 tons in 1905. Stocks in Hamburg and the Western German ports were 62,900 tons, against 41,400 last year, the bulk of the remaining surplus being in Belgium and Dunkirk. The total shipments from the West Coast in November-December, 1906, and January, 1907, to all parts (Europe, United States, etc.), were 553,064 tons, and, stocks in Chili being 600,000 tons, there is already available a surplus of 50,000 tons over the quantity required to provide similar exports to the end of January. Notwithstanding the supposed scarcity of labour—which is now officially admitted to be becoming less acute—last month's output

Digitized by Google

(172,222 tons) was the largest on record, and while one or two "oficinas" have for financial reasons temporarily shut down, two others, of much larger dimensions (the Miraflores and Moreno) are on the point of commencing operations, if they have not already done so; the former has been allowed an initial "cuota" of 950,000 quintals, and the latter is owned by the German Nitrate Company, which has always managed to produce its full allotments. Numerous works, with a collective capacity of several hundreds of thousands of tons, are in a more or less advanced stage of construction, others exist only on paper (where they are not unlikely to remain), and two of the English companies have just announced their intention to put up new oficinas. It can therefore hardly be said that there is a prospective nitrate famine!

It is yet early to express an opinion with regard to next season's European requirements, but there is no reason to anticipate that these will be on an abnormally large scale; on the contrary, the chances seem to be that they may be less than this year, for the area of cultivable land is inelastic, and a larger proportion is likely to be devoted to cereals, which at present prices pay better than sugar-beet. This would mean the employment of less nitrate of soda, which fertiliser will moreover again have to reckon with the competition of sulphate of ammonia; the output of the latter is increasing by leaps and bounds in Germany, and as it provides nitrogen at a considerably lower cost than nitrate, it is given the preference by many intelligent farmers; this happened last spring on the Continent, and history will repeat itself.

Notwithstanding the large sums spent in "propaganda" under the auspices of the Permanent Nitrate Committee (the estimates for 1907-08 provide for no less than £75,000.) consumption has of late shown little or no expansion, the European port deliveries having reached only 1,151,300 tons in the ten months ending October 31, 1907, compared with 1,152,990 tons in the corresponding period last year. Greater progress has been made in the United States, where the bulk of the imports is still used for chemical purposes, but the shipments from Chili in the past four months were only 107,202 tons, against 125,193 tons last year, and the financial crisis is not conducive to an immediate augmentation of business in that direction. The nitrate producers are contemplating an increase of the levy for propaganda purposes from $\frac{5}{16}$ths of a penny per quintal to one half-penny, and the Chilian Government, besides contributing £35,000. per annum, has sent over a Special Commissioner to inquire into the means of developing the consumption of nitrate of soda. A reduction in the selling price will be by far the most effective stimulus, and the proof that such reduction involves no real hardship on producers is afforded by the prospectus of the Lilita Company, dated September 20 last, in which the cost of production from low-grade "caliche" is estimated at 5s. 6d. per quintal, f.o.b. Yet the nitrate producers seem to consider it only natural and reasonable that they should get 9s. per quintal the while the output capacity is increased without limit.

In 1901-02, the first year of the "Combination," 59 "oficinas" were at work, the total initial "export cuota" was fixed at 31,091,095 quintals, and the selling price averaged 6s. 5d., after having been 4s. 6d. prior to the signature of the compact. In September last the number of "oficinas" working was 118 (with many more approaching completion), the initial "cuota" had been raised to 75,992,000 quintals, and the selling price was 9s., after having been as high as 9s. 9d. in October, 1906. The increase in consumption in the seven years has been under ten millions of quintals. Of course, the actual exports have not been within measurable distance of the quantities allowed, unexpected obstacles having arisen in the shape of want of labour, etc., but these, as already stated, are gradually disappearing, thanks to the establishment of the recruiting agencies referred to in the quarterly circular of the Propaganda Association dated Iquique, July 31. At the same time prices of coal and fodder are falling, thus reducing the cost of production, which is further helped by the depreciation of the Chilian currency; the "truck system" exists on the "Pampa," wages being paid in "fichas" or tokens exchangeable at the oficina steors, while the nitrate is sold on a sterling basis. It is now freely admitted in nitrate circles not only that the output will rapidly expand, but that prices must come down, hence the attempt to stimulate consumption by means of an increased outlay on pamphlets, lectures, field experiments and other modes of "réclame." Meantime the position is entirely fictitious, and reminiscent of that of copper before its recent sensational collapse; in the case of the metal the redundant stocks, however, were "invisible," whereas those of nitrate are in full view, and while future excess supplies of copper are in Central Africa and other inaccessible regions, those of the Chilian fertiliser are close at hand.

The fall of about one shilling per cwt. which has so far taken place, is quite insignificant compared with that justified by the outlook for the industry, and unless something altogether unexpected happens, a further readjustment of values appears to be inevitable. Holders and producers of nitrate will strenuously kick against the pricks, and a low estimate of November shipments may temporarily help the market, but the retention of supplies on the West Coast would merely postpone the evil day. Never has so little nitrate of soda been bought forward by consumers, and these will do well to continue a waiting policy. At the time of writing prices are quite nominal at about 8s. 3d. per quintal, f.o.b. for prompt shipment, and 10s. 9d. per cwt. for spring delivery in Hamburg; the south-west wind is bringing up a fleet of nitrate ships which will really test the market.

Although several companies have just declared magnificent dividends ranging up to 150% per annum, nitrate shares are practically unsaleable, and buyers at fancy prices are lamenting their enterprise. The prospect of lower selling prices and reduced "cuotas," meaning smaller profits, is not alluring.

THE FRANCO-BRITISH EXHIBITION.

The preparations for the Franco-British Exhibition, which will be held next year at Shepherd's Bush, are now attracting a good deal of attention. In our last issue we described the lines on which the Exhibition is being arranged, and the arrangements which are in active progress for the housing of the exhibits. The General Committee which has charge of the enterprise is in itself indicative of the magnitude of the undertaking, and the array of names included on the executive body is ample guarantee for the soundness and comprehensiveness of the Exhibition, which will probably be the greatest ever held in the United Kingdom.

The committee are sparing no efforts in their endeavours to interest British manufacturers, and they emphasise the fact that the average business man as yet scarcely appears to grasp the national scope of the Exhibition, or the advantages likely to accrue to the nation at large through

Digitized by Google

its being held in this country. Great Britain has for a number of years past allowed France, the United States, Belgium, and Italy to take the foremost part in the promotion of international exhibitions; in this respect France has taken the first place, and the committee regard it as a great compliment to Great Britain that France should now come forward to support this country in the promotion of an exhibition in which Britain is taking the lead. The committee appeal to British manufacturers for the greatest possible measure of support, and we are confident that the response from the chemical industries in particular will be an adequate one. The committee which has charge of the Chemical Section of the Exhibition (and of which Mr. Alfred Mond, M.P., is president) is a thoroughly representative one, and we trust that the exhibits will be worthy of the magnificent building which is being erected for their reception. We would emphasise the necessity for a whole-hearted response to the appeal for support which is being made with respect to the chemical trade, and we would urge the claims of the Franco-British Exhibition upon the attention of those chemical manufacturers who have not yet moved in the matter. The opportunity for demonstrating the progress of the British chemical and allied industries is indeed a unique one: The British exhibits will be arranged in juxtaposition to the corresponding French collection, and British chemical manufacturers should see to it that the national reputation in respect to this industry—in which we have by no means lost our laurels—is adequately and emphatically maintained.

THE OCTOBER TRADE RETURNS.

THE Board of Trade Returns for October show that the record which has already been established during 1907 in our overseas trade is fully maintained. The total imports for the month show an increase of three millions sterling and an increase in exports of over five millions. The figures for total imports during the ten months of 1907 are over thirty-five millions ahead of 1906, and nearly seventy-four millions greater than 1905. On the other hand, the total exports for the ten months of the year show an increase of forty-six millions as compared with 1906, and no less than eighty-five millions over the exports for 1905.

The imports of chemicals, drugs, dyes and colours in October amounted to £1,079,386., against £913,214. in 1906, an increase of £166,172. The imports of bleaching materials were valued at £2,877., against £3,912., and of soda compounds £11,773., against £8,933. in 1906.

The exports of chemicals, drugs, dyes, and colours in October amounted to £1,479,449., against £1,333,438. in 1906, an increase of £146,011. During the month the principal items were:—Bleaching materials, 95,181 cwts., valued at £19,880., against 88,458 cwts. and £18,643. in 1906. Coal products (not dyes), value £119,355., against £130,865. in 1906. Copper sulphate, 1,167 tons, valued at £29,053., against 441 tons and £11,102. in 1906. Dyestuffs, £35,172., against £31,550. in 1906. Glycerine, £38,252., against £25,143. in 1906. Chemical manure, 65,569 tons, valued at £377,563., against 57,935 tons and £320,656. Muriate of ammonia, 13,275 cwts., valued at £15,153., against 10,854 cwts. and £14,680. in 1906. Painters' colours and materials, 174,494 cwts., valued at £225,624., against 175,718 cwts. and £217,492. in 1906. Soda compounds, 623,943 cwts., valued at £203,699., against 550,203 cwts. and £157,639. in 1906. The exports of salt in October amounted to 48,754 tons, valued at £41,288., against 48,144 tons and £33,636. in 1906. Exports of "unenumerated chemicals" were valued at £257,287., compared with £266,815. in 1906.

The imports of oil seeds, nuts, oils, fats, and gums in October amounted in value to £2,539,386., against £2,118,657. in 1906, an increase of £420,729. The figures for petroleum were: 27,452,490 gallons, valued at £553,339., against 22,789,488 gallons and £467,408. in 1906. The value of exports of oil seeds, nuts, oils, fats, and gums was £366,970., against £281,318., an increase of £85,652.

The imports of metals and minerals during October were:—Copper ore, 7,555 tons, valued at £77,189., against 8,551 tons and £109,571. in 1906. Copper (regulus and precipitate), 3,786 tons, valued at £150,816., against 7,118 tons and £338,727. in 1906. Lead (pig and sheet), 21,924 tons, valued at £424,235., against 17,277 tons and £318,603. in 1906. Pyrites of iron and copper, 67,614 tons, valued at £108,566., against 66,770 tons and £123,424. in 1906. Quicksilver, 22,200 lbs., valued at £2,133., against 35,191 lbs., valued at £3,141. in 1906. Silver ore, value £264,313., against £168,818. in 1906. Tin, 4,016 tons, valued at £598,978., against 3,652 tons and £701,496. Zinc (crude), 8,198 tons, valued at £180,044, against 8,423 tons and £218,203.

AMERICAN METHODS FOR INCREASING TRADE.

MERCHANTS in South America use two methods in order to secure foreign business. The first is the sending out of agents, and the second the distributing of catalogues and advertising matter. "As regards the first method," says Mr. E. A. Burrill, U.S. Vice-Consul at Puerto Cabello, Venezuela, "the best way of getting foreign business is to employ an agent thoroughly conversant with trade possibilities, and knowing the language of the country to which he is sent. He should take a full line of samples, and should pay special attention to the tastes and customs of the consumers. As regards the second method, the catalogues, etc., would be more effective if printed in the language of the country in which they are to be distributed; they should be sent also to the various reading rooms, clubs, merchants' associations, and similar places frequented by a coterie of buyers. Institutions such as these are better fitted to distribute information than are the Consulates." In addition to being printed in the language of the country, the prices quoted in catalogues should be given in the currency of the country. The weights of the merchandise should either be stated in the metric system or the system in vogue at the place of distribution. All those who wish to get business through catalogues and advertising matter without the aid of a selling agent should see that every detail is properly presented. A list of Venezuelan clubs and merchants' associations in Puerto Cabello, Valencia, and Barquisimeto is filed for reference at the American Bureau of Manufacturers.

U.S. Consul Morgan, in his report on the trade of Würtemberg, observes that most American firms believe they can "work up" a good business through correspondence and catalogues, "but," he adds, "I doubt very much if any business worth having was ever worked up in this manner. The larger part of the catalogues sent here are in the English language, and as most of the merchants in this country are not familiar with that language, this printed matter usually finds its way into the waste-paper basket. All catalogues and other printed matter sent to this country ought to be in the German language, prices stated in German currency, and, if possible, freight and duty paid. All measures should be given in the metric system. Business in Wurtemberg is done practically in the same manner as at home, and any business worth having is worth seeking and must be constantly looked after, prices must be competitive, and manufacturers must be prepared to give from three to six months' time or a liberal cash discount. It would be of great advantage to send agents and drummers to this country who speak the German language fluently and are thoroughly capable

Digitized by Google

and familiar with the conditions of trade. Circulars in the English language, with prices in United States currency, generally f.o.b. New York cannot increase American exports. A splendid market exists for those who have enterprise and forethought enough to do business here systematically."

He concludes: "The development of the economic ideal in the German Empire, its phenomenal growth in the industrial arts, and its quick and scientific business methods, combine to create a field that should attract the attention of the American manufacturer and merchant."

Consul R. J. Thompson, in a report from Hanover, reverts to the same subject. In order to give a direct and initial connection with the German dealer, and on a more comprehensive scale than the limited number of local dealers, usually requested by the American manufacturer seeking an opening for export trade in Germany, a directory has been compiled. This directory, which is filed for reference at the Washington Bureau of Manufactures, comprises a special list of importers and dealers in all cities of the German Empire with a population of not less than 25,000, the names being taken from the "Deutsches Reichsadressbuch für Industrie, Gewerbe und Handel." While they are not vouched for as to financial responsibility or credit, they are fairly representative concerns, and will answer the purpose of an introductory correspondence with the view to inquiry as to market conditions in Germany with respect to possible demands for American goods.

THE INSTITUTION OF MINING AND METALLURGY.

STANDARDISATION COMMITTEE.

A CIRCULAR letter embodying a number of questions on the recommendations of the "Weights and Measures" and "Mesh" Standardisation Committees, was recently sent to members of the Institution and others. This circular has elicited answers from technical societies and Chambers of Mines, as also from 280 engineers and metallurgists; and these answers have very strongly confirmed the conclusions of the Standardisation Committees.

As regards the general adoption of the Metric System of Weights and Measures, opinions are so evenly divided that the Council do not feel justified in recommending uniformity of practice at the present time.

Whilst there is a very general feeling amongst engineers that the term "slimes" should be more clearly defined than at present, the suggestions received have been too divergent to justify the Council in making any recommendations on the subject at present.

The Secretary of the Institute has now issued copies of memoranda embodying the standards and definitions now adopted by the Council, and he is directed to express the hope that all members of the Institution, and other professional men, will adopt and use them in reports, scientific papers, and other publications.

In some replies containing objections to the convenient constant of 85s. for the value of one ounce of fine gold, the writers overlooked the fact that Clause (6) in the accompanying Memorandum refers only to *assay* results of ores, etc.; and it will be admitted that unavoidable variations in both check assays and check samples are such as to make the difference of 0.55 of a penny, per ounce of fine gold, a negligible quantity.

With a view to securing the greatest uniformity in the drawing of the wire and the manufacture of the standard screens, Messrs. N. Greening and Sons, Ltd., of Warrington, have agreed to manufacture a certain quantity of each of the standard sizes to a width of 8 in. at one operation, and these will be supplied by them direct, by their agents abroad, or by dealers in laboratory supplies. Sizes 5, 8, 10, 12, 16, 20, 30, 40 and 50 of these screens are now ready in 8 in. squares, and may be obtained in made-up "nests" by the end of November. The manufacture of the remaining sizes is being pressed forward with the least possible delay.

The following definitions have been adopted by the Institution:—

(1) The word "ton" shall represent a weight of 2000 lbs. avoirdupois (29,166.6 ozs. troy). *Note.*—It is advisable to abandon the use of the terms hundredweights and quarters, and to express fractions of a ton in pounds or in decimals of a ton.

(2) The term "miners' inch" shall represent a flow of 1.5 cub. ft. of water per minute; and the term "sluice head" shall represent a flow of 60 cub. ft. of water per minute. *Note.*—It is advisable to abandon the use of both terms, as being merely of local usage, in favour of definite expression of the flow of water per minute, or per second, in cub. ft. or in gallons.

(3) The word "gallon" shall represent the Imperial gallon measure of 10 lbs. of water.

(4) Temperatures shall be expressed in degrees Centigrade.

(5) Returns of gold and silver shall be expressed in terms of fine gold and fine silver respectively, not as "bullion."

(6) Gold contents of ores, etc., determined by assay, shall be expressed in money values as well as in weights; and in this connection the value shall be taken (as a convenient constant) at 85 shillings, or $20.67. U.S. currency, per troy ounce of fine gold.

The following table of "I. M. M. Standard Laboratory Screens" is intended for use in making grading tests and for the correlation of screens used in commercial or other work. When screens other than the I. M. M. Standards are employed, the diameters of apertures should be given in any published results, so that comparisons may be made. When screens are described simply by the number of meshes per linear inch, it will be understood that the I. M. M. Standard is referred to. The number of sizes standardised has been reduced to a minimum, as it is desirable to abandon excessive refinements in grading tests. It is believed that the I. M. M. Standards will meet all necessary requirements of the laboratory. In reporting grading tests it is desirable to state whether wet or dry screening has been employed.

Table.—I. M. M. Standard Laboratory Screens.

Mesh or Apertures per Linear Inch.	Diameter of Wire.		Aperture.		Screening Area
	in.	mm.	in.	mm.	Per cent.
5	0.1	2.540	0.1	2.540	25.00
8	0.063	1.600	0.062	1.574	24.60
10	0.05	1.270	0.05	1.270	25.00
12	0.0417	1.059	0.0416	1.056	24.92
16	0.0313	0.795	0.0312	0.792	24.92
20	0.025	0.635	0.025	0.635	25.00
30	0.0167	0.424	0.0166	0.421	24.80
40	0.0125	0.317	0.0125	0.317	25.00
50	0.01	0.254	0.01	0.254	25.00
60	0.0083	0.211	0.0083	0.211	24.80
70	0.0071	0.180	0.0071	0.180	24.70
80	0.0063	0.160	0.0062	0.157	24.60
90	0.0055	0.139	0.0055	0.139	24.50
100	0.005	0.127	0.005	0.127	25.00
120	0.0041	0.104	0.0042	0.107	25.40
150	0.0033	0.084	0.0033	0.084	24.50
200	0.0025	0.063	0.0025	0.063	25.00

Note.—Whilst *absolute* accuracy to the fourth place of decimals of an inch is impracticable in the manufacture of wire cloth, a sufficiently close approximation to the above standards is attainable. The adoption of a screening area of 25% necessitating equality of size of wire and aperture, secures perfect interlocking and consequent permanence of aperture. Some of the finer mesh screens can only be woven in what is known as "twilled."

SCIENTIFIC AGRICULTURE IN SPAIN.

THE general progressive movement in Spain is expressed by a recent Government order creating a sort of ambulating school for teaching scientific farming in the remote agricultural districts of the country. The Government order provides for a course of experimental and practical instruction to be given every year by itinerant lecturers, selected from among the agricultural engineers at the district Schools of Agriculture. In the months of January and February of each year the directors of these schools are required to report to the Department of Agriculture at Madrid, giving the programme of the lectures intended to be given during the ensuing twelve months, with an estimate of the cost, including travelling expenses and remuneration of the teachers, and transport of the agricultural machinery or appliances which it may be considered advisable to carry to those remote villages where the practical instruction is to be given.

So far only the Schools of Agriculture at Zaragoza, Jaen, Palencia, Badajoz, and Barcelona, and the two stations at Haro and Villafranca del Panadés are referred to in this order, but if the movement prove a success it will no doubt be extended, and must lead to a wider use of modern farming appliances in Spain.

SOCIETY OF CHEMICAL INDUSTRY.

LONDON SECTION.

A MEETING of this Section was held on November 4th, Mr. R. J. Friswell presiding.

The first paper, by Mr. Cyril Bergtheil and Mr. R. V. Briggs, dealt with the Determination of Indigotin in Indigo-Yielding Plants. The accurate determination of indigotin in the indigo plant is of considerable importance, since a correct estimate of the efficiency of the process of indigo manufacture depends thereon. A method of precipitating indigotin from an extract of the plant in boiling water by means of ammonium persulphate, proposed by Rawson in 1904, and modified by the present authors, has been shown to give correct results by comparison with those obtained by fermentation of the extract by means of the indigo enzyme (*J.S.C.I.*, 1906, 25, 729). This method has been criticised by Orchardson, Wood, and Bloxam, and two alternative methods have been proposed, one of which (depending on the same principle) is said to give results identical with those obtained by the authors' method; whilst the other, depending on the precipitation of indirubin by the action of isatin in acid solution, indicates a considerably higher potential yield of indigotin in the plant-extract used (*J.S.C.I.*, 1907, 26, 4). The authors' original method is now verified, and some minor modifications are recommended. It is shown that neither of the methods proposed by Orchardson, Wood, and Bloxam can be used in practice, since both lead to entirely erroneous results, unless the exact indican-content of the samples dealt with is previously known, and the methods adjusted accordingly. The conclusion that the isatin method may under certain circumstances indicate a higher indican-content in a given extract than the persulphate method is not borne out by the authors' experiments.

A paper by Messrs. R. Gaunt, F. Thomas, and W. P. Bloxam, on the Analysis of Indigo (Part III.) and of the dried leaves of *Indigofera arrecta* and *I. Sumatrana*, was also read. In this paper a summary is first given of the results of the work on indigo carried out for the Government of India at the University of Leeds during the years 1905-1907. In the present paper the exact conditions were prescribed for the preparation of pure indigotin to serve as the standard on which the tetrasulphonate process for the estimation of indigotin is based. A reply was made to certain criticisms on the tetrasulphonate process; the defects complained of were shown to be due to want of proper precaution on the part of the operators. The methods in use for the estimation of indigotin in the leaf were described. The persulphate method was found altogether faulty, as the results obtained by it were too low. The new "isatin" method was found to give much higher results, and, moreover, the method is quantitative, as proved by its action on the glucoside indican which has recently been isolated in quantity by Messrs. A. G. Perkin and W. P. Bloxam. As a result of employing the isatin

Digitized by Google

process the indigo leaf is demonstrated to be capable of yielding more indigotin than had previously been supposed. Again, the percentage of leaf present in the green plant has been underestimated in India. It is insisted that these facts are in favour of the survival of the Indian indigo industry. To this must be added the discovery by the authors of a sample of dried leaf of *I. Sumatrana* which was twice as rich in indigotin as any specimen of *I. Sumatrana* (the more highly valued Java or Natal plant). Finally, it was submitted that the work on the indigo ferment enzyme had not been properly followed out, and that the present reports on the Indian manufacture were eminently unsatisfactory, for:—(1) the colours giving value of the raw materials was seriously under-estimated, whilst (2) the indigotin value of the manufactured cake was over-estimated, and this owing to the persistent use of unsatisfactory methods of analysis in lieu of adopting the tetrasulphonate process.

THE FARADAY SOCIETY.

THE thirty-first ordinary meeting of the Faraday Society was held on October 29, at the Institution of Electrical Engineers, Mr. N. T. M. Wilsmore, M.Sc., presiding.

The Chairman announced that Sir Oliver Lodge had accepted the invitation of the Council to succeed the late Sir William Perkin as President of the Society.

A paper on "The Electrolysis of Salt Solutions in Liquefied Sulphur Dioxide at Low Temperatures," communicated by Dr. Bertram D. Steele, was read in abstract by the Secretary. This was a preliminary account of the results at present arrived at in the course of a general study of the electrolysis of salts in liquefied gases. The present paper deals with the case of a solution of potassium iodide in sulphur dioxide. Electrodes of various materials were used, and the changes at anode and cathode were carefully studied. With platinum or mercury cathodes a very rapid diminution of current (depending on the initial current density), due, in the author's opinion, to a film of sulphur, was observed. Potassium sulphite with an admixture of sulphur was after continued electrolys is found to be deposited on these cathodes. Using silver, copper, or iron cathodes of large area, a constant current was maintained, the sulphides being formed in these cases. Iodine was formed at the anode, being either liberated or found in combination, depending on the metal employed. No potassium as metal was found to be deposited on the cathode. The author concludes that sulphur cations exist in the solution. Measurements of conductivity and ionic velocities have also been made, and the results obtained will be published in due course.

Dr. T. M. Lowry was sceptical as to the existence of sulphur ions. He thought secondary reactions would explain Dr. Steele's observations.

A paper by Mr. F. E. Weston, B.Sc., and Mr. H. Russell Ellis, B.Sc., on "The Action of Aluminium Powder on Silica and Boric Anhydride," was read in abstract by Mr. Weston, who showed, on a small scale, some of the reductions described. The authors have studied the action of aluminium powder upon boric anhydride and silver respectively. It is shown that in the case of boric anhydride the reducing action of the aluminium depends upon the fineness of both the aluminium and the boric anhydride. *E.g.*: (*a*) Mixtures in molecular proportions of the finest obtainable aluminium powder and powdered B_2O_3 which has passed through a sieve of 14,400 meshes to the square inch react at once, in the cold, when started with a fuse of Mg ribbon and BaO_2 powder. (*b*) Mixtures in proportion of Al_2 to $2B_2O_3$ only react when heated to dull redness in a muffle furnace. (*c*) Similar mixtures to (*a*) and (*b*), but using B_2O_3 that has only passed through a sieve of 3,600 meshes to the square inch, only react when heated to 300° C. and dull redness respectively. The products of the reaction were shown to be Al_2O_3 and mixtures of boron with aluminium borides, the latter predominating in the mixture containing molecular proportions, and the former in the other mixture. In the action of aluminium upon silica the authors used for the latter kieselguhr, precipitated silica, and fine silver sand. Here again the action took place more readily with the finer varieties of silica, the speed and energy of the reaction being in the order—precipitated silica, kieselguhr, silver sand. The action took place in the cold with precipitated silica and kieselguhr on being started with a fuse of Mg and BaO_2, when the constituents in the mixture were in the ratio of $3SiO_2$ to 8Al; when the mixture contained the constituents in the ratio of $3SiO_2$ to 4Al the reaction only took place on heating the mixture to dull redness. When sand was used the mixture had to be heated to a dull redness in each case before the action commenced, and in the mixture containing $3SiO_2$ to 4Al free sand and free Al were found in the product. The products of the reaction contained in all cases Al_2O_3, silicon (as shown by the production of $SiCl_4$), and probably some silicides of Al.

Dr. R. Seligman suggested that some of the heat required in these reactions was furnished by the aluminium or boron, as the case may be, burning in the air. The fireproof slags obtained in many cases were being used for making acid-resisting crucibles and for other industrial purposes. Dr. F. M. Perkin pointed out that the difficulty of getting a fusible slag in all cases prevented the preparation in a pure state of products like boron and silicon.

Dr. F. M. Perkin and Mr. L. Pratt read a paper on "The Reduction of Metallic Oxides with Calcium Hydride," and illustrated some of the reductions. When copper oxide is mixed with calcium hydride in proportions corresponding to $2CuO + CaH_2 = 2Cu + CaO + H_2O$, and ignited by means of a match, a vigorous reaction ensues, and volumes of steam are given off. On cooling a black mass is obtained, which on treatment disintegrates, owing to solution of calcium oxide, and metallic copper in a state of fine division is obtained. Pyrolusite, hæmatite, and tin stone all behave in a similar manner. Zinc oxide appears not to be reduced. Lead sulphide and antimony sulphide both react vigorously, and during the reaction the mixture swells up considerably, rising up out of the crucible in a cylindrical form. Very little metal is produced, the bulk of the product being a dark grey mass, which appears to be a compound of the metal with calcium and sulphur. Borax and boric anhydride also react with calcium hydride when the mixture is strongly heated in the muffle furnace. Silica in the form of fine sand only reacts after prolonged heating, but reaction takes place more readily when kieselguhr is employed. Wolframite and rutile only react with difficulty. Experiments were also tried with metallic calcium and wolframite. In this case a particularly vigorous reaction takes place, the tungsten being melted and being obtained on cooling as a hard regulus. The heat is so great that the calcium oxide is also melted. Rutile is also reduced by calcium; the reaction, however, is not so intense, and the titanium and calcium oxide are not fused. The action of metallic calcium upon metallic chlorides was also studied. Manganese chloride and cadmium chloride are readily reduced. When metallic calcium and strontium chloride are mixed together in molecular proportions and ignited by heating in an iron crucible by means of the blowpipe, reaction ensues—

$$SrCl_2 + Ca = CaCl_2 + Sr.$$

Very little metal, however, is obtained, probably owing to the formation of a sub-chloride, ClSr – CaCl. On adding two atoms of calcium the reaction is intensely vigorous, and the metal is obtained as a fused regulus. With barium chloride the reaction is less vigorous. With the alkali metals very vigorous reactions also take place.

A New Wood Preservative.—Recent experiments in Belgium made with a new coal-tar extract, known as "injectol," have given satisfactory results, according to the American Vice-Consul at Ghent. The experiments were principally devoted to the treatment of wooden poles and blocks used in street paving. The product is a liquid, of a dark-brown colour, very thin, and of regular density. Its degree of viscosity changes very little with atmospheric variations. One of the principal advantages is its penetration into certain woods without any pressure. For the antiseptic treatment of compact woods, using the apparatus similar to the "Breant" system, the time necessary for the pressure and soaking of a given quantity of "injectol" is considerably less than for any other antiseptic liquid, including creosote. It has been found that where creosote poles in the ground have only resisted decay for a few months, those treated with "injectol" remained unattacked after three years. Similar experiments were also made with railway sleepers; the latter were treated with different antiseptics. Some were soaked in a mixture of coal creosote, creosote and chloride of zinc, and two were treated with "injectol." After having been left for a period of two years in a steeping vat composed of liquid manure and other miscellaneous decomposing substances, it was found that the two treated with "injectol" were still in good condition, while the others were almost completely destroyed. Similar results were obtained with wooden blocks for street paving. Other experiments are now being carried on, and the results obtained will be made public.

Continental Notes.

In the *Chemiker-Zeitung* for October 23rd, O. Sackur describes an ingenious apparatus for automatically regulating the strength of an electric current in spite of fluctuations in the voltage. The current to be regulated passes through an electrolytic cell, setting free a mixture of hydrogen and oxygen, which gases pass up a tube and through a capillary. If the current sets free the gas more rapidly than it escapes through the capillary, the pressure rises inside the electrolytic cell, and this pressure is communicated to a U-tube containing mercury and a bad conducting liquid, such as alcohol or water. Wires are let into this U-tube, and are connected up in such a manner that when the pressure rises a greater proportion of the current from the generator is shunted through it, and consequently less passes through the electrolytic cell and the other apparatus that is in series with it.

In the same issue, N. A. Orlow writes on the action of osmium peroxide on soluble iodides. Contrary to the statements made in some text books, OsO_4 does not set free iodine from neutral potassium iodide solution, but on the addition of hydrochloric acid the reaction takes place at once. The same applies to other soluble iodides. Osmium is to be considered as belonging to the seventh group of the periodic system, the same group that manganese and ruthenium belong to, and not to the eighth group, which in this series contains iridium, platinum, and gold.

There is also a report of the steam explosions that took place in Germany during 1906.

In the issue of October 26th, Prof. H. Erdmann has an interesting note on solid air. If air is dried, freed from carbonic acid, then liquefied under a pressure of 4 atmospheres in a cooling apparatus, and the clear liquid thus obtained is introduced into a vessel which is evacuated to 10 or 20 m.m. of mercury, it becomes semi-solid through the separation of crystals of nitrogen. It differs in this respect from ordinary "liquid air," which has an entirely different composition from real air. The author suggests that this property may be made use of for the preparation of pure nitrogen for scientific and technical purposes, as the purification of nitrogen by chemical means or by fractional distillation is extremely difficult and expensive.

There is also a report upon industrial poisoning with chromium compounds, by L. Lewin, which is of considerable interest in view of the increasing use of these substances for many technical processes. All chromium compounds are poisonous, whether they are present as lumps or powder, or are mixed with or dissolved in water. Also materials such as paper or linen upon which chromium compounds are deposited may act in a poisonous manner to a man coming in frequent contact with them. Different individuals are affected in different degrees by these compounds, but none should presume upon an apparent immunity. The chromium compounds affect first the places with which they come in contact, causing irritation and swelling. If they afterwards get into the blood, they cause pains in the head and stomach, and may then affect the kidneys. As means to prevent this poisoning, the worker's hands should be protected by constantly rubbing them with fresh oil, such as earth-nut oil, or by coating them with collodion, or, best of all, by wearing impervious gloves. The chromium worker must not on any account touch any part of his body with his hands unless they are clean. He should not talk or sing at his work for fear of inhaling chromium dust, and if there be much dust he should wear a respirator. He must not eat or drink in the work room, and before having a meal he must rinse out his mouth, brush his teeth, and clean his hands with brush, soap, and sand. If the necessary appliances are present the nose also should be rinsed out. Taking snuff is of no use as a preventive. Every chromium worker should be examined by a medical officer every week, and if not satisfactory the dangerous work must be suspended.

E. R. Besemfelder in the *Zeitschrift für Chemische Apparatenkunde* for October 15th describes a new filtering plant suitable for the treatment of water supplies and other liquids upon a large scale. The filter consists of a number of high rectangular troughs, the sides of which are composed of the porous filtering material. Each of these troughs is fitted with an opening at the bottom to run off the slime, and between every pair there is a space for the filtered water to run down. In consequence of the height of the filter chambers, the pressure at the bottom is considerable, and the rate of filtration correspondingly rapid. The form of the filter offers great facilities for cleaning and renewing it.

The same issue contains a description of a plant for pumping effluents by means of compressed air. In consequence of the corrosive character of many effluents from chemical works, it is not possible to make use of ordinary metallic pumps. The plant described works upon the same principle as the ordinary acid "egg."

THE INDIAN OILSEEDS CROP.

THE second General Memorandum on the Sesamum (til or (jinjili) crop of the season 1907–08 has been issued by the Indian Commercial Intelligence Department, dated Calcutta, October 24th.

The Memorandum deals with provinces containing areas under sesamum representing about 70% of the total acreage under that crop in British India, calculated on the average of five years ending 1905–06. The first forecast on the Hyderabad crop will be received in January next, and from Bengal and Eastern Bengal and Assam in March.

The figures of acreage reported by the United Provinces, the Central Provinces and Berar, and Madras, show increases amounting respectively to 3.5, 4.6, and 7.6%; but against these must be set large decreases in the figures reported by Bombay (25%), Sind (17%), and the Panjab (19%). The total figures for all the provinces dealt with in this memorandum show a net decrease of 8.4%.

In the United Provinces, the Central Provinces, and in the northern parts of the Bombay Presidency, the crop is withering on account of prolonged drought. In Madras, Sind, and the southern parts of the Bombay Presidency, the crop is in fair to good condition. The irrigated crop of the Panjab is reported to be "fair to below average," but the state of the unirrigated crop is bad, owing to the failure of the rains.

Estimate of the acreage under sesamum in October :—

Provinces.	1907-08.	1906-07.	1905-06.
United Provinces (*a*)	320,000	309,200	278,200
Central Provinces and Berar..	847,600	810,600	792,800
Madras (*b*)	314,000	291,800	478,600
Bombay (*c*)	786,800	1,049,400	893,000
Panjab	77,100	95,500	133,700
Sind (*c*)	46,600	55,900	84,400
Total	2,392,100	2,612,400	2,660,700

(*a*) For "unmixed" crop only. (*b*) For raiyatwari villages only up to end of September. (*c*) Including Native States.

The following is a summary of the provincial reports. The figures in brackets, following the name of each province, indicate what percentage of the total area under sesamum in British India is ordinarily cultivated in that province.

United Provinces (20%).—The area under "unmixed" crop is at present estimated at 320,000 acres, which is slightly above last year's area. No estimate is now possible of the area under "mixed" crop, which usually constitutes more than two-thirds of the total area under sesamum in the province. The rainfall in August was favourable, and sesamum was sown on a somewhat larger scale than last year. But the crop is now withering owing to the cessation of the rains at the close of August, and the final return is likely to show a reduction in the area now estimated. The outturn is at present estimated at 25% of the normal in Bundelkhand (where more than three-fourths of the total sesamum area of the province is cultivated) and at 50% in the rest of the province. This estimate also is liable to further reduction, as the effects of the drought cannot be fully ascertained at present.

Central Provinces and Berar (18.5%).—The total area is now estimated to be 847,600 acres (755,800 in the Central Provinces and 91,800 in Berar) as compared with 810,600 acres (720,400 in the Central Provinces and 90,200 in Berar) for last year—an increase of 4.6%. The good outturn and prices obtained last year combined with favourable conditions at sowing time, induced the cultivators to extend the area under sesamum. In the August forecast the prospects of the crop were described as satisfactory. Since then, however, the seasonal conditions have not been favourable. The rainfall of August was heavy and continuous, and considerable damage was caused to the early sown crop. In the middle of that month the rain ceased suddenly, and the plants withered in several districts. The crop is now reported to be deteriorating for want of sufficient

Digitized by Google

moisture, but a good shower of rain would improve it greatly. The state of the late sown crop is also disappointing, except in two districts. The reports received from the districts point to an outturn of 88% of the normal in the Central Provinces, and of 65% in Berar. If, however, the drought continues, the outturn is sure to be reduced.

Madras (17.2%) now reports 314,000 acres under sesamum in raiyatwari villages up to the end of September—an increase of about 8% (22,200 acres) as compared with the corresponding period of last year, but a decrease of 28% as compared with the average of the preceding five years. Villages, other than raiyatwari, report a total area of 25,500 acres, which is more than double the area reported for the corresponding period of last year. The condition of the crop is reported to be either fair or good.

The British districts of *Bombay* (8%) estimate the total area sown, so far as reported, to be 293,400 acres, which is 35.4% less than the area at the corresponding date of last year. The Native States (including Baroda) report 493,400 acres as compared with 595,500 acres at this date last year—a decrease of 17%. The decrease is attributed to the late commencement of the monsoon, to incessant rain in Gujarat and North Deccan, and to insufficiency of sowing rain elsewhere. The crop is now withering in most parts of Gujarat and North Deccan, and is expected to yield only a poor return. In South Deccan and East Karnatak the crop is fair where it has been helped by the recent rains. In the Konkan and West Karnatak it is good.

Panjab (4%) now estimates the area to be 77,100 acres as compared with 95,500 acres for last year—a decrease of 19.3%. The condition of the irrigated crop is "fair to below average." The state of the unirrigated crop is bad, and little yield can be expected, owing to the failure of the rains.

Sind (2%) reports the total area to be 46,600 acres (3,900 in Native States) as compared with 55,900 acres (4,400 in Native States) at the corresponding date of last year—a decrease of about 17%, attributed to low inundation. The condition of the crop is at present fair.

Indian Notes.

THE Government is pursuing an inquiry as to the numerous kinds of insects which produce lac in India.

Dr. Wilson has retired from the Chemistry Chair of the Madras Presidency College, after 33 years' service.

The Burmese Government propose to sell the lease of the Government rubber plantation, at Mergui, for a period of thirty years, with the right of renewal for another twenty years. The area contains about 340,000 rubber trees.

A concession of eighteen square miles, which is being worked in the Banganapalli State, is said to contain valuable deposits of copper, showing 22% of metal. It is also stated to be diamondiferous, and contains manganese.

Samples of Indian turpentine, which the Forest Department of the United Provinces is now manufacturing at its factories at Dehra Dun, Naini Tal, and Nurpur, have been sent to England for chemical examination.

The United Provinces Government proposed to allot Rs.100,000. for plague purposes this year, but this has now been increased to Rs.300,000. for disinfectants, rat poisons, chemicals, etc. Among the sums allotted, Meerut, Agra, Rohilcund, Benares, Lucknow, and Fyzabad will each receive Rs.25,000., Allahabad Rs.30,000., Gorakhpur Rs.20,000., etc.

Owing to shortage of railway wagons, there was a decrease of about 48,000 maunds of salt in the Bombay Presidency last year. The salt comes from three sources—from the Government brine works at Kharaghoda and Aden, from the sea-salt of Government and private works, and (of minor importance) imported salt. The quantity of the first-named, Baragra salt, produced, amounted to 2,362,073 maunds. The greatest difficulty was experienced in getting the natives to work at the salt pans, as they could earn double the ordinary wages as field labourers. The total quantity of salt issued for consumption in the Bombay Presidency amounted to 2,702,794 maunds, of which 519,305 were Baragra, 2,183,489 sea-salt, and 267,764 imported. Taking the population at 20,974,649, the average per head was 11.65 lbs., as against 11.05 lbs. the previous year. New salt works are being erected at Bhandup, capable of turning out 1,500,000 maunds per annum.

CHEMICALS IN CENTRAL SOUTH AFRICA.

THE following is a list of imports into the Transvaal, Orange River Colony, and Southern Rhodesia during 1906:—

	Transvaal.	Orange River Colony	Rhodesia
Candles	864,985	92,105	84,570
Cement	157,080	43,720	10,195
Drugs, chemicals, etc. ..	2,356,335	196,955	204,755
Mineral oils	330,685	94,000	38,645
Other oils	339,905	38,610	47,645
Painters' materials ..	208,840	47,560	13,785
Common soap	405,450	115,350	39,755

Trade Notes.

CASTNER-KELLNER ALKALI CO.—The directors have declared a dividend at the rate of 16% per annum for the six months ending September 30 last, making, with the interim dividend already paid, 12% for the year.

THE BRITISH WOOD PULP ASSOCIATION:—The annual dinner of The British Wood Pulp Association was held on Thursday evening last, at the Midland Hotel, Manchester, a goodly number of gentlemen connected with the pulp and paper trades attending.

PLATINUM PRICES.—Platinum still droops, and prices in the Urals are now quoted 5 roubles 15 copecks down to 4 roubles 60 copecks per solotnik, for 83% metal content. No business is being done, consequently considerable stocks are now accumulating.

THE SANTA CATALINA NITRATE CO., after deducting £7,755. for depreciation, etc., has an available balance for the year ended June 30, of £31,151. The directors propose a final dividend of 10%, making 35% for the year, to transfer £1,000. to general reserve account, and to carry forward £2,501.

THORNTON COAL AND LIME CO. LTD.—Capital £4,000., in £1. shares. This company has been formed to acquire the business of The Thornton Coal and Lime Co., Thorntonhall, and to carry on all or any of the businesses of coal, ironstone, fire-clay and limestone mining, etc. The first directors are C. J. Anderson, J. Gray, W. Cumming and R. Clelland; qualification £100.; remuneration £25. per annum each (chairman £50.). Registered office, 113, W. Regent-street, Glasgow.

THE CASTOR PLANT IN FORMOSA.—The United States Consul at Tamsin reports that although the castor plant grows wild in parts of Formosa, nothing has been done to utilise the beans produced by this plant for the manufacture of oil. He adds that several Japanese have recently interested the Formosan Governmen tin the possibilities of the plant, and steps are now being taken to utilise the bean in the production of castor oil. The wild plants found here are of two varieties, one of which is dark green and the other red in colour. The beans produced by the latter are twice the size of those produced by the former, and are thus more valuable as oil producers. Formosa is never visited by frosts, except in the higher mountain altitudes, hence the castor plant is enabled to produce more beans than the plants found in more temperate regions. As castor oil is extensively used in the arts, those interested in the industry in Formosa hope to find no difficulty in disposing of their products in Japan.

OLIVE OIL ADULTERATION IN SPAIN.—Owing to the abnormally high prices at which olive oil is being sold this year some dealers have resorted to the practice of adulterating olive oil with linseed or sesame oil, in order to bring it within the reach of their poorer customers; indeed, some manufacturers of these seed oils have prepared a special grade from the first crushings which is being used for the purpose. According to a United States Consular Report, representations have been made to the Spanish Government with a view to protecting the interests of the manufacturers of olive oil, but some of the leading olive-oil crushers have held aloof, considering such action futile, inasmuch as the prevailing conditions will, in all probability, have disappeared within a few months, and the enforcement of existing municipal by-laws and regulations is all that is required to all insure that no olive oil be sold as such which contains any admixture of other oils. The alleged cases of adulteration refer solely to oil for local consumption, and not to manufacturers with accredited brands which are sold for export.

Process for Obtaining Pure Copper. Lucien Juman, Rue Mogador, Paris. British Patent, 530. Date claimed under International Convention, June 26, 1906.

It has been stated that when cupric sulphate is heated in solution with sulphurous acid, a salt of copper is precipitated and free sulphuric acid formed, and that this reaction may be used as a means of separating copper by precipitation from solutions obtained by leaching ores. The inventor has discovered that when a salt of copper is heated in a closed vessel under pressure in presence of sulphurous acid, the salt of copper is reduced to pure metallic copper, while the sulphurous acid is oxidised to sulphuric acid. Starting with a solution of sulphate of copper produced by leaching an ore, it suffices to dissolve in this solution a certain proportion of sulphurous acid sufficient to realise the equation $CuSO_4 + SO_2 + 2H_2O = Cu + 2H_2SO_4$, to introduce the liquid thus prepared into a digester made of copper or iron lined with lead, for instance, and to heat the liquid in this digester, under the pressure generated, to a temperature in the neighbourhood of 170° C. The reaction is very rapid, and precipitated copper and sulphuric acid are the products. Setting aside certain intermediate reactions, the result of the operation may be expressed by the equation $CuSO_4 + SO_2 + 2H_2O = Cu + 2H_2SO_4$. The copper thus obtained is very pure, frequently containing 99.9% of the metal, for, apart from the gold and silver which may be found in the presence of copper, none of the ordinary metals which generally accompany copper is precipitated under these conditions. Instead of sulphurous acid, sulphites may be used, which in this case are converted into sulphates. If the precious metals are present they may be separated by a preliminary treatment of the solution of copper with sulphurous acid at a raised temperature, but under ordinary pressure. In this manner the precious metals are alone precipitated in the metallic state and can be recovered. By subsequently operating under pressure, as has been indicated above, the copper is separated in a pure state. The process yields, therefore, pure precipitated copper on the one hand, and, when sulphurous acid is used, sulphuric acid on the other hand. The copper may be fused or simply compressed into briquettes by hydraulic pressure. These briquettes may be used directly as anodes in ordinary electrolytic refining vats, if it is desired to separate in this manner, the precious metals not previously eliminated. The sulphuric acid may be applied for numerous purposes, and notably for the leaching of the ores. The method is particularly advantageous for the treatment of sulphide ores. During the roasting of these the sulphurous acid necessary in the treatment is produced, this acid being transformed very simply in the treatment itself into sulphuric acid.

Improvements in or relating to the Manufacture of Cement. The Collos Portland Cement Co., Ltd., 139, Cannon-street, London, E.C. (Communicated by Dr. Heinrich Colloseus, 29, Pragerstrasse, Berlin.) British Patent, 1,647. January 22, 1907.

The invention relates more especially to the system of cement manufacture wherein a dry cement is obtained directly, by the injection of suitable salt solutions into a stream of slag, in such a manner as to yield at once a pulverised material containing a uniform and intimate mixture of salts. The object of the present invention is to enable a slag cement to be obtained in the direct manner indicated, which shall possess a particularly high degree of resistance to the action of sea water.

Instead of treating the molten slag with solutions of alkaline or alkaline earth compounds, the solutions employed are those of iron compounds or of compounds of metals associated with the iron group, such as chromium, nickel, manganese and the like, though for commercial reasons the iron compounds are those usually employed, and of these the sulphate is generally found most convenient, though the chloride may also be used.

It has been found that when treated in the manner indicated, the presence of the iron salts (or the like) intimately distributed throughout the mass, gives to the slag cement (when used and allowed to set in the ordinary way, like Portland cement) the power to resist the action of sea water very effectually, and to a much greater extent than in the case when alkaline or alkaline earth salts are employed.

In one example of the mode of carrying out the invention, the stream of slag is run upon a revolving cylinder having perforations through which the salt solution is projected radially into the body of the slag, the arrangement being as set forth, for instance, in the Specification of British Patent No. 14,329, of 1905. In this way, whilst the water of the solution is instantly evaporated, the slag itself is disintegrated and pulverised, and the salt is left in intimate or molecular contact therewith, distributed evenly throughout the powdered mass which collects at the bottom of the apparatus.

As examples of the proportions to be employed, the patentees state that in the case of a slag containing 32% of silica and 40% lime, a 5% solution of sulphate of iron may be employed and be made to act on the finely pulverised blast furnace slag in sufficient quantity that, after the water has completely evaporated, the iron salt remaining in the pulverised slag forms approximately 1% of the whole. If the slag contains only 40%

Digitized by Google

or less of lime, and a higher percentage of silica, for instance 39% of lime, and 40% of silica, then a 10% solution of sulphate of iron may be employed in the manner indicated above to yield a mass containing approximately 4% of the residual iron salt. Thus it may be stated that about 0.6% of the salt are injected into slags containing 50% lime, whereas 1% is used for slags containing 45% of lime, and from 1.5 to 10% for slags containing 40% or less lime.

Improvements in Lead Chambers for the Manufacture of Sulphuric Acid. L. G. Fromont, 201, Avenues Brugman and Albert and Elizabeth, Bruss ls. British Patent, 4,861. February 28, 1907.

The object of this invention is best indicated by the claims, which are :—(1.) A lead chamber for the manufacture of sulphuric acid, in which, in order to provide a maximum of radiating surfaces, the walls are made of an undulatory section, with or without plates, forming radiating plates, or are constructed of planes provided with radiating plates, and may also have their exterior surfaces matted, roughened or unpolished. (2.) A lead chamber for the manufacture of sulphuric acid, in which a maximum of radiating surface is obtained by the arrangement, within the chamber, of inwardly extending baffles or re-entrant parts. (3.) A lead chamber for the manufacture of sulphuric acid, in which the maximum of radiating surface is obtained by the constructions referred to in Claims (1) and (2) and characterised by the employment of a roof of an elliptical form, with undulations, the latter constructed with or without radiating plates. (4.) A lead chamber for the manufacture of sulphuric acid, in which the maximum of radiating surface is obtained by the constructions referred to in Claims (1) and (2) and characterised by the facts, that the radiating efficiency of the said surfaces is preserved by the employment of means of suspending the chamber, which are entirely metallic ; that the chamber is maintained sufficiently removed from the walls of the framing as to admit of the chamber suspension attachments being provided for its whole length and arranged so as to allow the free expansion and contraction of the said chamber ; and by the fact that the roof is freely suspended by a metallic arch, from the upper frame of the structure.

An Improved Process for Oxidising Borneol or Isoborneol for the Manufacture of Camphor. A. Verley, E. Urbain and A. Feige, 27 Rue Notre-dame de Nazareth, Paris. British Patent, 14,550. June 24, 1907.

This invention relates to a process for oxidising borneol or isoborneol for the manufacture of camphor.

The inventors observe that it is known that all oxidising agents transform borneol and isoborneol into camphor, but it is very difficult to avoid formation of products of oxidation of the camphor itself. The process according to this invention avoids the formation of such products by using as the oxidising agent a chromic acid mixture which is active in the cold.

It is known that sulphuric acid can form several combinations with chromic acid ; these combinations part with their oxygen in the cold with the greatest facility in presence of oxidisable matters. A very active combination is produced by making a mixture under the following special conditions :—50 parts of sodium bichromate are dissolved in 50 parts of water. After dissolution there are added 68 parts of sulphuric acid of 66° Baumé specific gravity. The following equation is realised :—

$$Na_2Cr_2O_7,2H_2O + 3H_2SO_4 = Na_2SO_4 + 2(CrO_3,SO_3,H_2O) + 3H_2O.$$

The borneol or isoborneol is dissolved in any non-oxidisable solvent, preferably carbon tetrachloride, $C\,Cl_4$, because after oxidation the solution containing the camphor will be at the lower part of the mixer wherein the oxidation is effected, and this solution need merely be drawn off.

The chromic acid mixture is diluted with water until it has become six times its original volume. The solution of borneol or isoborneol is added, in such proportion that the excess of the chromic acid mixture is one-third of that theoretically required. After agitating for two hours, the oxidation is at an end ; the solution of camphor is separated and there is added to the solution of the chromic acid mixture (spent as to three-quarters) the theoretical quantity of the undiluted mixture prepared as aforesaid, the said theoretical quantity being relative to the weight of borneol or isoborneol to be oxidised. In this manner the same liquid can be used over and over again until saturated with chromium sulphate.

Improvements in Electric Furnaces. H. Pauling, 84, Wilhelmstrasse Gelsenkirchen IV., Westphalia British Patent. 18 990. August 22, 1907.

The inventor claims :—(1.) In an apparatus for producing voltaic strong-current arcs, the combination of a pair of diverging electr des with means for blowing a current of gas through the space of greatest proximity of the electrodes and in the direction of divergence thereof, the said space being large enough not to disturb a free passage of the said gas current, and with means for starting the discharges. (2.) An apparatus as defined in the preceding claim, characterised by the feature that the said means for starting the discharges is constituted by a pair of auxiliary electrodes electrically connected to the said main electrodes and extending into the space between the latter. (3.) An apparatus as pointed out in Claim (2) characterised by the said auxiliary electrodes being adjustable.

Answers to Correspondents.

We cannot undertake to reply to correspondents through the post. Those of our readers who have addressed queries to us should look in this column for a reply.

W. J. K.—Thanks for addendum, which has our attention.

W. G. W.—We have passed this matter through, in the usual course.

J. E. B.—The paragraphs mentioned appeared in the *Journal*, and you will have received our letter bearing on the point.

J. J. G. and Sons.—Thanks for your letter. We should like to have the matter and blocks within the next fortnight, if possible.

S. C. W. S., Ltd. — The point raised is of interest, and we are looking into the matter. Meantime we have written you by post.

G. S. and S. (L.) Ltd.—We shall be pleased to deal with the subject of your first letter in our forthcoming Special Issue. We regret that a further card was sent you respecting subscription ; this was entirely an oversight.

DUTCH MADDER.

MESSRS. W. BUNGE & CO., of Rotterdam, report as follows, under date November 7th :—

The first casks of the new crop have been offered, and show a satisfactory quality. The old stock only amounts to about 50 casks, and it is expected that the new casks will find a ready sale.

Present quotations per cwt., in original butts, actual tare, f.o.b. Rotterdam, are :—

Fine crop	at	54s.
Small crop	,,	47s. 6d. to 51s.
Fine ombros	,,	42s. 6d. to 47s.
Good ombros	,,	30s. to 44s.
Small ombros	,,	30s. to 44s.
Regrounds	,,	30s. to 44s.
Mulls	,,	11s.
Roots	,,	— ..
Garancine	,,	50s. to 75s.

A Far East Cement Factory.—The *Torg. Prom Gazeta* states that a company is being formed for the installation and exploitation of a Portland cement factory in the Amur Province. The capital is £75,000.

Russian Electrolytic Copper.—" Copper " is the name of a company being formed for the purpose of exporting and manufacturing copper in Russia by the electrolytic process, with a capital of £50,000.

Municipal Electricity.—The West Ham Corporation Electricity Department has just secured a contract with the Co-operative Wholesale Society to supply their flour mills and their new soap factory at Silvertown with electrical power for all purposes. The contract is based on an annual consumption of five-and-a-half million units—a supply which exceeds in amount the total output of many of the large provincial towns which have municipal electricity undertakings. For power purposes West Ham charges only 1d. per unit, giving special discounts to large consumers, and recently the Department has installed many of the factories in the district with electrical plant

Sulphate of Ammonia in Germany.—A sulphate of ammonia plant is to be laid down in connection with the coal mine at Salzernenach (Essen) belonging to Krupp's.

Society of Dyers and Colourists.—The first meeting of the Manchester section of this society was held on Friday week at the Municipal School of Technology. The Chairman (Mr. W. H. Pennington) referred in fitting terms to the great loss which the society had sustained since their last meeting, by the death of their President, Sir William Perkin, founder of the aniline dye industry. A paper was read by Mr. Berthold Wuth entitled "The Hydrosulphites and their Technical Applications." Although the solid hydrosulphites were, he said, of comparatively recent date as commercial articles, their application in the textile colouring industries, especially in calico printing, had made rapid progress, with the result that at the present time effects could be obtained which were formerly unknown.

Market Reports.

THE INDIGO MARKET.

Messrs. Millward and Co. report as follows, under date November 12th :—

Since the October auctions a moderate but continuous business has been transacted, both for home and export, at steady prices. Holders of the rather restricted stocks show no disposition to force business, and a continuance of hand-to-mouth buying, at full prices, seems probable, pending arrival of new crop supplies. Then, of course, events will be largely shaped by the Calcutta auctions. It is anticipated that the total out-turn of the new crop will be about the same or rather less than last year, say 26,000 to 28,000 maunds, against about 28,000 maunds last season. Stocks in all the distributing centres are very small, and if there is good general buying prices may be fully upheld or slightly advanced. The average quality will not be so high as last season, but planters are hoping to realise as much for their good to fine grades as they did last year for their fine to superfine. There will be a much larger selection from the present crop of good medium indigo, testing about 60%, and which has been scarce and badly missed this year. The general outlook is not unfavourable, and, the speculative element having been eliminated from the trade, a fairly regular, legitimate business may now be anticipated, with increasing dimensions when climatic conditions result in increased supplies and cheaper prices; there are unmistakeable signs of a revival of favour in this natural and most satisfactory dye when the time does arrive Deliveries from London Jan. 1 to Oct. 30 this year were 2,588 chests and 558 serons, against 2,923 chests and 779 serons last year. Stocks in London on Nov. 1 were 2,301 chests and 195 serons, against 2,058 chests and 370 serons last year. Deliveries from Manchester have almost exhausted the stocks held there.

THE AMERICAN CHEMICAL MARKET.

NEW YORK, October 28th, 1907.

(Rate of Exchange, $4.83 = £1.)

Nitrate of soda is dull at $2.40. per 100 lbs. Sulphate of ammonia is unchanged at $3.05. per 100 lbs. Grey muriate steady at 66¼c. as to make. White muriate for electrical purposes weak at 5⅝c. to 6c. per lb., with considerable offerings. Lump sal ammoniac 9¼c. per lb. Lump carbonate of ammonia steady at 7⅜c. to 8c. for spot, but next year's contracts are keenly competed for, and prices are inclined to be shaded. Sulphate of copper is firmly held at 5½c. by the Syndicate. White powdered arsenic remains steady at 6⅞c. to 7c. for prompt and a little less for future shipment. Red Saxony arsenic 7½c. per lb. Bleaching powders are steady at $1.15. to $1.25. per 100 lbs. Alkali is in good demand, at 92½c. for light 58%, in bags, f.o.r. makers' works, and caustic soda, 74%, is quoted at $2.10., same conditions. Carbonate of potash, calcined 80-85%, is 3¾c. to 3⅞c. per lb., and hydrated, same test, 4¼c. to 4⅜c. Chlorates are 8½c. for soda, and 8¾c. for potash, f.o.r. makers' works, under syndicate control, and next year's prices have been fixed at the same price. Prussiate of soda 9¼c. for prompt, and potash 15½c. Bichromates of soda and potash are respectively 7⅞c. and 8⅝c., and are in usual fair demand. Antimony products are showing a weakening tendency, with oxide quoted at 10½c., and antimony salts, 47%, at 12c. per lb. Oxalic acid is in more plentiful supply, and is offered on spot down to 7¾c. per lb. Naphthaline balls for next year's delivery are offered at $2.25., and flakes at $2.15. per 100 lbs.

TAR AND AMMONIA PRODUCTS.

THURSDAY.

Benzols quiet, with quotations given at 9d. for 90's, and 8¾d. for 50-90's, casks included. Crude tar, 14s. 6d. to 18s. 6d. per ton, Thames; 1⅛d. to 1⅛d. per gallon, delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 24s. to 24s. 3d., f.o.b.; Gas Company, 26s. 6d.; East Coast, 22s 9d. to 23s. 3d.; West Coast, 22s. to 23s. Refined naphthalene, £6. 10s. to £8. 10s., packages included. Toluol, 90%, 10d. to 10½d.; pure, 1s. 1d., casks included. Carbolic acid, crude, 50%, 1s. 5d. to 1s. 5½d.; 60%, 1s. 7¾d. to 1s. 8d.; 75%, 1s. 11¾d., casks included. Crystals, 39-40, 5⅛d.; 34-35, 4⅝d. to 5d. Cresylic, 95%, 1s. 1d. to 1s. 1¼d. Anthracene, 40 to 45 per cent. A, 1¾d., casks included. Pyridin, 4s. to 4s. 3d.

Sulphate of ammonia steady. Nearest values are:—Beckton, to end of year, £12. 7s. 6d. to £12. 10s.; next year, £12. 7s. 6d. to £12. 10s.; Beckton terms, £12. 2s. 6d.; London, £11. 8s. 9d. to £12.; Hull, £12. 2s. 6d.; Liverpool, £12. 2s. 6d. to £12. 3s. 9d. Manchester, £12.; Leith, this year, £12. 7s. 6d. to £12. 10s.; next year, £12. 7s. 6d. to £12. 10s.

Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 9d.; Liverpool, ordinary, 11s., and refined, 11s. 1½d. Official quotations:—Cargoes, off coast or due, 10s. 9½d.; ditto for prompt shipment, 11s. 1d.

THE LONDON METAL MARKETS.

WEDNESDAY.

Copper: Standard brands, £59. to £59. 5s. cash, and for three months. Tin: G.M. quality, £137. to £137. 10s. cash, and £138. 15s. to £139. 5s. three months; English, £140. Lead: Soft foreign, October, £18. 10s.; November, £18.; December, £17. 12s. 6d.; February, £17. 15s.; English, £18. 15s. to £18. 17s. 6d. Spelter: Ordinary brands, prompt, £21. 7s. 6d.; January, £21. 5s.; February, £21. 2s. 6d.; hard, £18., f.o.b. Antimony, £38. to £40.; ore, £11. to £12. Bismuth, 6s. 6d. Quicksilver, £8. 5s.; seconds, £8. 3s. 9d. Nickel, 1s. 10d. per lb. Aluminium, £110. Wolfram, 35s. Pig-iron closing prices: Cleveland, 51s. 2d. cash; 50s. 8d. one month; 50s. three months.

FERTILISER MATERIALS.

FRIDAY.

The market for nitrogenous material has been rather quiet during the past week, but there is no pressure to sell, and prices are fairly well maintained.

Mineral phosphates are without any new feature to comment upon.

The value of East Indian bone meal remains unchanged at £4. 18s. 9d. per ton, nett cash, c.i.f. Liverpool, for near shipment; whilst on spot the quotation is still £5. 5s. to £5. 10s. per ton ex store, according to quality.

Nitrate of soda is again somewhat easier, and there are sellers to-day at 11s. per cwt., ex store Liverpool, for ordinary, and at 11s. 1½d. for refined quality.

MISCELLANEOUS CHEMICAL MARKET.

THURSDAY.

Reports from all quarters indicate a fairly steady demand for heavy chemicals, both home trade and export. Sulphate of copper has again declined in price to £21., f.o.b., for spot, and £20. 10s. to £20. 15s. for spring shipment. Owing to the continued fluctuation of prices, business in this article is somewhat unsettled. Quotations for caustic soda and bleaching powder are unaltered. Chlorates of potash and soda are now offering, for 1908 contracts, at 3½d. per lb. Saltcake is firm at 42s. 6d., nett, carriage paid, and makers are fairly well sold for next year. Recovered rock sulphur steady at £4. 10s., f.o.r. Nitrate of soda 11s. 3d. to 11s. 4½d. per cwt., f.o.r. Liverpool. There is good inquiry for prussiates, both spot and forward, and quotations are unchanged at 5⅞d. and 3⅝d. per lb., for potash and soda respectively. Carbonate and caustic potash are still in short supply, and high prices are being obtained. American acetate of lime is quiet, and values are slightly lower; grey, £12. 5s. to £12. 7s. 6d., c.i.f.; brown, £8. 5s. per ton; other acetates are rather slow of sale. The demand for white powdered arsenic is very small just now, and quotations are weaker at £28. 10s. to £29., Garston, for best brands. Green copperas continues scarce and dear; Welsh makes are selling at 20s., f.o.r. Oxalic acid steady at 3¾d. per lb.

LIVERPOOL DRYSALTERIES.

THURSDAY.

Montreal potashes very quiet, with quotations given at 35s. 9d. per cwt. Pearl ash nominal. Logwood in moderate demand. Cutch quiet. Gum copal in fair inquiry for Arabic at recent values. Castor oil quietly firm at 3⅝d. for good seconds Calcutta on spot, and 3⅜d. for November-December; French 3⅞d. for first pressure, and 3½d. for second pressure. Gambier: Block, 23s. 6d. per cwt. on spot; November December shipment, 21s.; and December-January shipment, 20s. 6d. Cubes, 29s. 6d. per cwt. on quay. Shellac dull: Fair TN orange, January-March shipment quoted at 102s., and March delivery at 106s. to 107s. Glucose firm: American liquid, 43%, 12s. 6d. on spot, and 12s. for October-December delivery; for prompt shipment, 10s. 1½d., and for October-December, 9s. 7½d., c.i.f., for shipment. American powdered starch, 11s. on spot, and 10s. 6d., c.i.f., for shipment. Pearl, 10s. 7½d. on spot, and 10s. c.i.f., for shipment. Cream of tartar, 98% foreign powder, 88s. to 89s.; 95% 86s. to 87s. Tartaric acid: English, 11½d. on spot, and foreign, 11d. Citric acid: English, 1s. 8½d.; foreign, 1s. 8½d.

LIVERPOOL OIL AND COLOUR MARKET.

THURSDAY.

OILS.—Palm oil dull; sales reported including Benin, on spot, at £27. 5s., and Old Calabar, on spot, at £28. 5s. per ton, both in transit. Linseed oil quiet, at 25s. to 26s. per cwt. for Liverpool makes in export casks. Cottonseed oil in fair demand at 25s. 3d. to 26s. 3d. per cwt. for Liverpool refined in export barrels. Tallow inactive. Turpentine quieter at 36s. per cwt. for spot parcels. Petroleum in moderate inquiry at 7d. for Russian and Roumanian, and 7½d. to 8½d. per gallon for American refined oils. Petroleum spirit steady, at 1s. 0½d. to 1s. 3d. per gallon.

HULL PAINT, OIL, AND COLOUR REPORT.

THURSDAY.

OIL.—Prices on the whole are lower than a week ago, although better at the time of writing than they have been. Turpentine, being particularly an American commodity, has suffered most, with a drop of 30s. per ton. Shipments of linseed have been upon a small scale, in spite of which the market has been weak and declining. Cottonseed imports have been large, and in sympathy with America has declined 3s. 9d. per ton. Amongst the principal weekly imports are:—Flour, 1,840 cwts.; wheat, 178,799 cwts.; Linseed, 13,250 qrs.; cottonseed, 5,365 tons; castor seed, 3,475 qrs.; rapeseed, 10,875 qrs.; lard, 2,079 cwts.; margarine, 3,001 cwts.; sugar, 15,414 cwts.; glucose, 40 cwts. Hemp, 1,170 cwts.; colours, 657 pkgs.; oilcake, 80 tons; hides, 631 cwts.; wool, 17,695 lbs. Amongst the weekly exports are:

Digitized by Google

Colours, 3,019 pkgs.; oil, 9,849 cwts.; chemicals, 1,984 pkgs. Linseed oil opened firm, and closed dearer; naked, spot, 22s. 4½d.; November-December, 22s. 4½d.; January-April, 21s. 6d.; boiled and refined, £1. to £1. 10s. per ton extra. Exports for the week, 25 tons, against the corresponding week last year of 20 tons. Linseed, La Plata, 42s. 6d., spot; same price on passage; October-November, 42s. 6d.; 1,500 tons sold December January at 40s. 6d. up to 41s.; January-February, 700 tons sold at 40s. 3d.; 300 tons February-March sold at 40s. 6d. Refined cotton oil opened easy, closed firm; naked, spot, 22s. 3d.; month, 22s. 3d.; November-April, 22s. 3d.; crude spot, 21s.; November-April, 21s.; casks £1. and barrels £1. 7s. 6d. per ton extra. Exports for the week have been 247 tons, against same week a year ago 455 tons. Cottonseed, spot, sold at £6. 17s. 6d.; afloat sold at £6. 17s. 6d.; ditto, November; November-January, £6. 18s. 9d.; sellers, Bombay, November-December, £6. 1s. 6d., Hull. Turpentine, flat, spot, 35s. 3d.; December, 35s. 9d.; January-April, 36s. 6d.; May-June, 36s. 9d.; Russian ditto lower, 20s. Castor oil made here, November-December, 31s. for 1sts to July-December, 30s. 3d.; seconds, £1. per ton lower. Olive oil, Levant, £41. to £42. per tun. Resins a turn lower, according to grade.

CAKES.—Linseed, 95% pure, £7. 15s. to £8.; Russians, £7. 15s.; Canadian, £8.; oilcake, £6. 15s.; cotton cakes, best, £5. 2s. 6d.; Bombay, £4. 7s. 6d. Rape meal, feeding, £5. 5s. Manure, £4. 5s.

TYNE CHEMICAL REPORT.

THURSDAY.

Market steady with a moderate demand. Caustic soda is firm at £10. 5s. per ton for 70% and £11. per ton for 76-77%. Bleaching powder £5. to £5. 5s. per ton. Soda crystals quiet at £3. to £3. 2s. 6d. per ton gross weights. Sulphur scarce and firm at £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £10. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—Market here is steady with a good inquiry, and prices are firmly held for shipment to end of year. There is an active demand for gas and steam coals. Current quotations are:—Best Northumbrian steam, 15s. to 15s. 6d. per ton; seconds, 14s. to 14s. 6d. per ton; small steam, 10s. to 10s. 6d. per ton; Northumberland unscreened, 12s. per ton; best gas coals, 15s. to 15s. 6d. per ton; Durham bunker coals, 12s. 6d. to 13s. per ton; coking coals, 14s. per ton; household coals, 16s. 6d. to 17s. per ton; foundry coke, 22s. per ton; gas coke, 19s. to 19s. 6d.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, THURSDAY.

The feeling in the ordinary heavy chemicals is slightly quieter in tone, but values are not appreciably affected. Sulphate of copper is rather steadier, and the figure of £24. has held practically unchanged for some days. Sulphate of ammonia has gained a little as regards spot dealing; the forward basis still remains without any real renewal of actual business. The outlook for the calico printers and the cotton dyers has not improved, but rather the reverse owing to the increased uncertainty as to future supplies of cotton. Still, the market for colour chemicals and drysalteries, though easy, shows no loss to speak of. In the section of mineral oils and paraffins a regular steadiness is the rule, with prices firm, and a good daily volume of business passing. The 865° gravity of lubricants is again scarce, and a fraction dearer.

Chief prices current are:—Alum (in lump), £5. 5s. to £6., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 15s. to £5., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3½d., nett, Glasgow; creosote (ordinary coal-tar and blast furnace), 2¼d. to 2½d., naked, f.a.s. Glasgow; nitrate of soda- 11s. 1½d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2⅜d. to 2½d. per lb.; paraffin wax, 120°, semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¾d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating) 865°, £6. to £6. 5s.; 885°, £6. 15s. to £7.; 890-895°, £7. 10s. to £8.; prussiate of potash, 5⅞d. to 5⅞d., nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £2. 17s. 6d. to £3.; sulphate of ammonia, £12. 5s. to £12 6s. 3d., prompt, f.o.b. Leith; sulphate of copper, £24. less 5% Liverpool, prompt.

New Companies.

Belgian Asbestos Lubricating Co. Ltd.—Capital £10,000., in £1 shares. This company has been formed to take over the agency in Belgium for the sale of oils, asbestos, lubrications and other products of the General Lubricating Co. of Philadelphia, U.S.A., and to adopt an agreement with A. R. Harvey. No initial public issue. The first directors are E. L. Bell and A. R. Harvey; remuneration 10% of the net profits available for distribution, divided.

British and Colonial Camphor Co. Ltd.—Capital £100,000., in 30,000 A and 70,000 B shares of £1 each. This company has been formed to adopt an agreement with La Compagnie Française du Camphre and to carry on the business of manufacturers, distillers and refiners of, dealers in, and agents for the sale of camphor, celluloid and turpentine and their derivatives. No inital public issue. The first directors are to be appointed by the subscribers; qualification, £1,000.; remuneration, £100. each per annum (chairman, £50. extra). The A shares rank first for 6% dividend, and participate *pari passu* with the B shares in any surplus after 6% has been paid on the latter also.

Chemical Research Syndicate Ltd.—Capital £500., in 1s. shares. This syndicate has been formed to carry on the business of scientific or manufacturing chemists, manufacturers of and dealers in medicines, foods, wines, spirits, chemical products and commodities, etc. No initial public issue. Registered without articles of association.

Cofner and Achner Ltd.—Capital £2,000., in £1. shares. This company has been formed to carry on the business of chemists, druggists, drysalters, oil and colourmen, opticians, manufacturers of electrical, surgical and scientific apparatus, etc. No initial public issue. Registered without articles of association. Registered office, 113, Leadenhall-street, E.C.

Danish Asbestos Lubricating Co. Ltd.—Capital £1,000., in £1. shares. This company has been formed to take over the agency in Denmark for the sale of oils, asbestos, lubrications and other products of the General Lubricating Co. of Philadelphia, U.S.A., and to adopt an agreement with A. R. Harvey. No initial public issue. The first directors are E. L. Bell and A. R. Harvey; remuneration, 10% of the net profits available for distribution, divided.

Harlington Lime Works Ltd.—Capital £10,000., in £1. shares. This company has been formed to acquire the business carried on by J. Ince and Mrs. M. A. Ince, at Harlington, Beds, as the Harlington Lime Works, to adopt an agreement with the said vendors and E. Wilkins, and to carry on the business of lime, cement, brick, tile, pipe, coal and coke merchants, etc. No initial public issue. The first directors are J. Ince and E. Wilkins. Mary A. Ince may, while holding 3,000 shares, appoint a director; qualification, £200.; remuneration of E. Wilkins, as secretary,

Digitized by Google

not less than £156. per annum. Registered office, 46, Queen Victoria-street, E.C.

German Asbestos Lubricating Co. Ltd.—Capital £10,000. in £1. shares. This company has been formed to take over the agency in Germany for the sale of oils, asbestos, lubrications, and other products of the General Lubricating Co. of Philadelphia, U.S.A., and to adopt an agreement with A. R. Harvey. No initial public issue. The first directors are E. L. Bell and A. R. Harvey; remuneration, 10% of the net profits available for distribution, divided.

New Dynant Anthracite Colliery Ltd.—Capital £50,000., in £1. shares. This company has been formed to carry on the business of colliery proprietors, miners, waggon builders and repairers, manufacturers of gas, coke and patent fuel, etc. No initial public issue. The first directors are to be appointed by the subscribers; qualification, £250.; remuneration (except managing director), £200. each per annum, and £50. extra for the chairman. Registered office, Norfolk House, Laurence Pountney Hill, E.C.

Netherlands Asbestos Lubricating Co. Ltd.—Capital £6,000., in £1. shares. This company has been formed to acquire and carry on the agency in Holland for the sale of oils, asbestos, lubricants and other products of the General Lubricating Co. of Philadelphia, U.S.A., and to adopt an agreement with A. R. Harvey. No initial public issue. The first directors are E. L. Bell and A. R. Harvey; remuneration, 10% of the net profits available for distribution, divided.

Scandinavian Asbestos Lubricating Co. Ltd.—Capital £2,000., in £1. shares. This company has been formed to acquire and carry on the agency in Norway and Sweden for the sale of oils, asbestos, lubrications and other products of the General Lubricating Co. of Philadelphia, U.S.A., and to adopt an agreement with A. R. Harvey. No initial public issue. The first directors are E. L. Bell and A. R. Harvey; remuneration, 10% of the net profits availalbe for distribution, divided.

Wheatrex Co. Ltd.—Capital £2,000., in 500 7% cumulative preference and 1,500 ordinary shares of £1. each. This company has been formed to acquire and turn to account any invention relating to the improvement or manufacture of bread and any extract or material connected therewith, or relating to any cleansing or washing powder or other compound, in particular to acquire from A. M. Parker, R. W. Papineau, A. E. Oppenheim and V. Murray the benefit of certain secret processes and inventions, and to adopt an agreement with the said vendors and T. Pollard. No initial public issue. The first directors are A. M. Parker, R. W. Papineau, A. E. Oppenheim and V. Murray; qualification, 200 shares; remuneration, £2. each per week (subject to the director devoting his time to the business) and 10% of the net profits, divided. Registered office, 79, Mark-lane, E.C.

LATE ADVERTISEMENTS.

ANTIMONY SMELTER, 22 years' experience, seeks situation, home or abroad. Manufacturer of oxide, sulphide, and regulus of antimony from high, low, and complex ores.—"1,581," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

WANTED, Supplies of Oil for making Disinfectant Fluid, with Carbolic co-efficient of 12 to 14.—Apply, Milton Richards, 31, Longford Place, Manchester, S.

YOUNG CHEMIST requires Situation; good qualifications and references, quick routine analyst and research; wages 30s. weekly.—"1,605," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C.

Our Registered Telegraphic Addresses are:—
"Trepex, London."
"Expert, Manchester."

Our Telephone Numbers are:—
London: 13692, Central.
Manchester: 3060.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*—payable in advance—including postage to any part of the world, are as follows:—

Yearly (52 numbers) ..... **12s. 6d.**
Half-Yearly (26 numbers) ..... **6s. 6d.**
Quarterly (13 numbers) ..... **3s. 6d.**

Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To Be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

30 Words and under ..... 2s. 6d. per insertion.
Each additional 6 words ..... 0s. 6d. ,,

Advertisements of Situations Wanted are inserted at the following rates when cash is sent with order:—

24 Words and under ..... 1s. 0d. per insertion.
Each additional 6 words ..... 0s. 3d. ,,

Advertisers would oblige by writing advertisements and letters of instructions on separate sheets of paper.

CURRENT TOPICS.

THE SMOKE NUISANCE.

NO excuse is required for reverting once more to such an important subject as that of the abatement of the smoke nuisance in industrial centres. In connection with the recent Gas Exhibition held in Manchester, one of the most interesting features was a series of lectures on this problem. The primary object of the lectures was, of course, to emphasise the advantages which would result by the more universal use of gas in place of coal as fuel. While this would be a good thing for the gas industry, it would incidentally do much to prevent the emission of smoke.

Following these lectures, a meeting was held last week in Manchester, attended by representatives of thirty organisations, and promoted by the Conference of Associations and Institutions engaged in Social Service and by the Manchester and Salford Sanitary Association. At this meeting Mr. A. Gordon Harvey, M.P., in moving a resolution on the subject, expressed the opinion that the inspection of smoke should be placed in the hands of highly trained inspectors responsible to the central authorities, as under the Alkali Acts. This is an argument which has been used in these columns repeatedly. Mr. Harvey observed that the Alkali Acts were now recognised "as a blessing by the manufacturers whom they were passed to control." In supporting his argument he took the standpoint that factory smoke can now be stopped. At the works with which he is himself connected (a firm of cotton spinners and dyers), although 200 tons of coal per week were consumed, there was no smoke nuisance. By the use of the most modern appliances, this had been accomplished with economy in working expenses, and the result was better than could be obtained by the very best and most careful hand-firing. Mr. Harvey went on to observe that for years he had urged the adoption of strong measures to prevent the smoke nuisance, but so long as this could not be done with economy, he felt that there was a poor case to go before the hard-headed manufacturers of Lancashire. Having accomplished this task, however, he believed that the authorities should firmly insist on the abolition of smoke.

The argument as stated by Mr. Harvey represents the only common-sense solution of the problem, so far as manufacturers' smoke is concerned. We recently had the pleasure of reviewing Messrs. Booth and Kershaw's work on "Smoke Prevention and Fuel Economy," in which it is conclusively demonstrated not only that smoke prevention is possible, but that in the attainment of this object it is also possible to effect considerable economies in the use of fuel. If further proof of the soundness of this argument were needed, it is supplied by experiences such as that quoted above by Mr. Harvey:

Digitized by Google

The very serious question as to the part played by domestic fires in the production of smoke and fog was also dealt with, in the course of the lectures already mentioned, by Mr. R. H. Clayton, the Vice-President of the Manchester Chemical Club, who quoted some interesting analyses on the subject. Mr. Clayton contended that the pollution of the atmosphere in Manchester was mainly from domestic smoke, and we think that the figures which he quoted (and which will be found reproduced in another column) may be accepted as proof of the charge (also repeatedly made by us) against the domestic fire as the greatest sinner in the production of smoke. After reviewing the various possible solutions of the problem, Mr. Clayton concluded that the use of coke and gas was the most promising, but gas at anything over 2s. per 1,000 cubic feet was too heavily handicapped. In this again we are in complete agreement with Mr. Clayton, and it is unnecessary to recapitulate the arguments in favour of the cheaper supply of gas for power and heating.

We think it may be taken that the case for smoke prevention, so far as industrial furnaces are concerned, has been proved—and this not merely without involving additional cost, but even with the accompaniment of considerable economy. The question of domestic smoke is the most difficult side of the problem. It must, however, be attacked, and it seems to us that the spirit in which the whole question should be approached was indicated by Mr. J. W. Graham, M.A., the Principal of Dalton Hall, Manchester, who presided at the meeting referred to above. Mr. Graham urged that smoke reformers should not be actuated by want of sympathy to any class of the community who in the course of their business had not succeeded in abating the smoke produced by them, but rather in the spirit of co-operation, in view of the great public necessity for the purification of the atmosphere.

TRADE OPENINGS IN RUSSIA.

The recent Anglo-Russian agreement has attracted a good deal of attention to Russia as a possible field for British commercial enterprise. It must be confessed that the hints contained in the reports of our Consular representatives in Russia are not generally regarded as affording sufficiently explicit or expert advice on the subject, and this reason lends additional interest to a series of articles now appearing in the *Financier*, and written by Mr. R. J. Barrett, the Editor of that paper.

Mr. Barrett is of opinion that the Russian Empire of to-day offers an inexhaustible field of opportunities to the British manufacturer who is willing to conform to its requirements. No single country or market is best for all manner of commodities, but Russia, with its vast expanse of territory, offers the British manufacturer an unlimited field. Mr. Barrett then quotes a few figures in support of this argument.

According to preliminary returns just published by the Russian Customs Department, the foreign trade of both European and Asiatic Russia, export and import, in 1906 amounted to £203,583,892., the value of exports having reached £117,107,261., and that of imports £86,476,631. Compared with the year immediately preceding, the former showed a slight decrease, while the imports were in excess of 1905 by £15,306,948. The exports from European Russia were lower in value by £3,386,843., while the value of the export trade of Asiatic Russia increased by £2,614,946. The imports of both the Russias were greater than in 1905 by over £15,000,000. On the whole, the bulk of the trade shows an increase of £14,535,051. The total value of the goods imported into Russia from the United Kingdom in 1906 amounted to over £11,000,000., nearly a million more than in the previous year. There was an increased importation of cotton yarn, wine, spirits and beer, coffee, rice, wool yarns, jute, coal, gold, silver, and platinum, manufactured; the importation of machinery and parts of machines, with the exception of agricultural machinery, also increased, as did flax and hemp, and woollen and cotton manufactures. On the other hand, there was a diminution of the importation of tea, herrings and other fish, raw cotton, cast-iron (raw and worked), iron (assorted), agricultural machinery, and chemicals.

In certain branches of trade in which England has lost ground, it is not the demand that has decreased, but the business activity of the German representatives that has increased. German firms advertise successfully and make their goods known all over the country by means of agents; the English traveller, on the other hand, is very seldom seen at all. The British manufacturer secures some local agent and entrusts him with the sale of his goods. This system, though advisable in some lines, is a grave mistake in many instances, especially in the agricultural and other machinery business, as the local agent has several other similar lines, and it is to his interest to push those on which he has the most profit. On the subject of local agencies Mr. Barrett quotes the opinion of Consul-General C. S. Smith, of Odessa, who says:—"British firms enter into communication with certain persons who, having paid a rouble and got their names entered in British directories, style themselves agents. The firms suffer losses in consequence, and discredit falls indiscriminately on the guilty and the innocent. British traders in Odessa goods should always make careful inquiries on the spot before entering into relations with unknown buyers or sellers."

Commercial travellers in Russia must provide themselves with a travelling licence, costing £5., to which must be added 10% for other extras; in addition to this they must take out a trading licence, costing £15., for the firm or company for whom they are travelling. Suppose that the firm of Smith and Jones manufacture machinery for which there is a demand in the Russian market. Having first sent over a representative able to speak Russian, to examine and compare the machinery used in the country with their own, and having settled the important questions of freight and duties, the firm can go ahead, though they should investigate carefully first. They must protect their patents and secure the best local representatives; they must supply their representatives with a catalogue, printed in Russian, giving a full description of each machine; if the prices of their kind of machinery are given in roubles by other foreign makers, they must do the same, and the pr ce quoted must be f.o.b: the freight car at the local railway station, or on board the steamer at the dock. When sure that they can compete, in results and price, with other foreign makers, Messrs. Smith and Jones may commence by covering the field. A traveller who understands the practical working of the machinery should work in conjunction with the local representative; in doing business with Russians the traveller should remember to go gently and not try to "rush" things. The social side of the question is an important one. The stiff British manner should give way to the affable cosmopolitan manner that is so hard for the average Englishman to acquire. The question of credit is an important one. It is the custom of the country, and cannot be altered. The Russian merchants look at the question of credit from the standpoint that "if a man's

Digitized by Google

credit is good, the money is good," and if he gets his 6 to 8% for that money, he considers that the money is just as good as in the bank.

Mr. Barrett continues :—" The real Russian is always ready to help another in trouble. Englishmen who have lived in Russia say they would as soon trust a Russian as an Englishman ; the dishonest element in Russia is certainly not the native element. Russian bankruptcy laws are somewhat lax. If a firm is in financial difficulties, it is allowed to avoid a real bankruptcy by making an application to have its affairs managed for a time by a committee of creditors. In Poland no such arrangement is possible, which fact leads many purely Polish firms to make their nominal headquarters at St. Petersburg, or somewhere in Russia, in order to take advantage of this privilege. The manufacturer, therefore, should be careful in giving credit, but if a certain amount of caution is exercised, there will not be much more possibility of loss than at home."

Summing up the main reasons why English manufacturers find it difficult to do business in Russia, Mr. Barrett gives them in the following order :—(1) Spasmodic and careless representation. (2) Wrong methods of solicitation. (3) Indifference to, or lack of knowledge of, local conditions and requirements. (4) Refusal to make certain small changes in machinery that has proved " satisfactory " at home. (5) An exhibition of too much " superiority." (6) Limited facilities to intelligently handle the demand when it has been found. (7) Unwillingness to allow or modify domestic sale conditions or conform to those of the country exploited. (8) The desire to compel the Russian buyer to learn English in order to help him (the manufacturer), instead of learning Russian to facilitate matters for the buyer. " The total abolition of each and every one of these barriers is easy, and suggests no commercial revolution. Every successful exporter has solved the problem, and found it easy. Let the others go and do likewise."

EXAMINATION OR RESEARCH?

Our contemporary, the *Electrical Review*, publishes some comments on a recent letter to the *Times* by a Fellow of Corpus Christi College, Oxford. The writer of this letter attacks that well-worn bugbear—the examination system, alleging, *inter alia*, that it suppresses all ability and distinction ; sterilises the teachers, amongst whom research does not pay ; renders nugatory all teaching that does not enable a student to pass an examination ; furthermore, when once acquired, the complaint can never be altogether purged from the system, and has, indeed, on occasions been even known to lead to personal violence ! A sufficiently striking list of indictments, we should imagine. But the writer is far from being at the end of his tether. He goes on to denounce the examiners, who, he says, examine so continuously and conscientiously that they can hardly keep abreast of the progress made in their own subject. Outside the University the belief in examination is even more pathetic than within. Parents and others trust so much to examinations simply because such things appeal to the sporting and competitive cravings of a nation that takes the same interest in a "blue ribbon" scholarship that it does in a "blue ribbon" horse race.

Our contemporary agrees, to a certain extent, with this explanation of the state of affairs, but at the same time puts forward the British " paterfamilias " as having too much common-sense to regard himself as an authority on education; For generations it has been impressed upon him by University professors, who certainly have an axe to grind in the matter, that the passing of a series of examinations is at once the object of education and the test of efficiency. This bowing down to the idol of examinations is by no means confined to Oxford ; it is common all the world over. But this fact only goes to prove the pathos of the situation that the average Englishman should have been so long and so uniformly deluded on the subject of education that he has come at last to subscribe to the University profession of faith in examination with all its attendant evils.

THE MONEY MARKET.

SOME interesting comments on the crisis in the money market (which was dealt with at length in these columns last week) appear in the *Investors' Guardian* of the 16th inst. Our contemporary observes that although the adoption of a 7% Bank Rate has been followed by a steady flow of gold from the Continent, which in the week ended November 13 resulted in the arrival of no less than £4,809,000., the international money position is by no means so favourable as this large influx would on the face of things lead one to presume. " New York and its hinterland still hunger for gold ; indeed, the hinterland may be said to be voracious, and to have no means of satisfying itself, The money stringency in the interior of the States shows no signs of abatement. The greatest inconvenience is being caused ; wages are being paid by cheque, and a profitable business in cashing such cheques has arisen. Many industrial concerns, being unable to finance themselves, are dismissing employees and reducing stocks of raw material as much as possible. It is difficult to place contracts with any real idea that they will be carried out to time." The usual crop of rumours and contentions come from New York. We are constantly told that the worst is over, and we may as constantly reply that the present is bad. Gold engagements from abroad continue to increase, and although the improvement is difficult to perceive at this distance, there has been, it is reported, some cancelling of amounts engaged in London. The premium on currency has reached 5% at Pittsburg, and with a state of things in existence that produces such a premium it is futile to talk of the worst being over, for if the worst is over it must have been much worse than we imagined.

" It seems that the hoarding of gold in the States has grown to such an extent that it is being severely resented. The trust companies have indicated individuals who drew out large sums, and similar information has been provided by safe deposit officials, so that the hoarders can be attacked. Mr. Cortelyou now attributes the crisis to hoarding, and has declared that if the money now being hoarded was put back into trade, there would be an almost complete resumption of business in twenty-four hours. But if the crisis is due to hoarding it only shows how deep-seated the lack of confidence in American finance is among the American people, for all Mr. Cortelyou's and Mr. Morgan's assertions as to the soundness of the banking position have failed to move it. That the American public has completely lost faith in trust companies that carry fifty and sixty times their capital and capital liability in deposits is not surprising —what is surprising is that they retained it so long. People on this side are now asking what will happen when the periods of notice for the withdrawal of deposits, which have been insisted on, expire."

REPORTED COPPER " RING."—The *New York Times* states that a huge copper pool has been formed in London. The members of the " ring " are engaged in buying up at a cost of fifteen million dollars 50,000 tons of copper for November and December delivery. We reproduce this report with all reserve.

THE POSITION OF CHEMISTRY IN GREAT BRITAIN.

INTERESTING SPEECHES AT LIVERPOOL UNIVERSITY.

THE position of chemistry in Great Britain was the subject of several interesting speeches at the first annual dinner of the Liverpool University Chemical Society, held on Saturday last.

Dr. E. K. Muspratt observed that in this country about sixty years ago, owing, he supposed, to the backward state of the Universities, the only way in which chemical science was kept before the public was through the foundation of the Chemical Society of London. The work of the Society greatly impressed Professor Hoffmann, who, when he returned to Germany after spending a number of years at the Royal College of Chemistry, founded the Chemical Society of Germany. The German Society had been of immense advantage in furthering the progress of the science. Some fifty or sixty years ago the English Universities had fallen behind in respect of chemistry. Even in Cambridge, which had taken a prominent place in the promotion of science, they had made their name in physics and not in chemistry. We were now progressing, however, and he was glad to say that in the Northern Universities they had given a prominent place to the great science in which all his hearers were interested. Chemistry in this country was formerly looked down upon; in fact, it was not considered a respectable profession. Even in Liverpool, in those days, although they had in the neighbourhood some chemical manufacturers, there were very few scientific chemists until Dr. Campbell Brown came amongst them. He was gratified to say that in the University of Liverpool they had encouraged the science of chemistry. At a meeting in favour of the establishment of University College he had remarked that it seemed ridiculous to suggest that they should have only one Professor of Chemistry; he went on to say that when he was at the small University of Giessen there were no fewer than five Professors of Chemistry, and he looked forward to the time when, if they had a University in Liverpool, they would have as many professors. He was now glad to say that they had three professors and a large number of lecturers on chemistry at the Liverpool University. It was desirable that all the various departments of chemistry should occasionally be brought together. The professor of general chemistry, the professor of organic chemistry, the professor of physical chemistry, and the professor of biological chemistry were each only pursuing one part of the great service of chemistry, and through their unity, and by the direction they would give to the extension of chemistry in their various departments, the whole science of chemistry would be benefited.

In proposing the toast of "The chemical industries of the Empire," Mr. W. H. Roberts said that the need for improved and more rapid methods of production, and the utilisation of what was once regarded as waste matter, had opened up a great field for those connected with the chemical industries, and those who looked upon matters from the purely scientific point of view. Up to 1880 this country held all the chemical trade; from 1880 to 1890 we held our own with foreign competition, but from 1890 onwards he understood we had been gradually but surely losing ground, and had been importing chemicals into this country at a great rate. That was a matter for regret. He believed that a great deal depended upon British chemists, who, he thought, could do even better than in the past.

In replying to the toast, Mr. Max Muspratt said that the chemical industries of the Empire represented the acme of scientific attainment applied to the practical things of life. It had been truly said that the chemical industry was one of the greatest barometers of trade in the world; the reason was that the products of the chemical industry entered in greater or less proportion into every conceivable walk of life. Mr. Roberts, he thought, had been a trifle pessimistic; the chemical industry of England possibly did not occupy the same proportion of the world's industry that it did before, but it was because the rest of the world could not be expected to go to sleep for ever. The year 1900, which was often referred to by people, was, as all of them knew, a year of decided depression and trouble in England, because their attention and cash were being expended in South Africa; but even in that year the total number of men employed in the chemical industry was about 60,000, whereas in 1880 it was only something like 40,000. Therefore, a dying industry, as some people alleged it to be, managed to find employment for 50% more men in twenty years. In comparing Germany and England they had a number of factors to consider. England started with a ton and stood at the ton; the Germans started with a pound avoirdupois and worked up to the ton. What we in the heyday of prosperity thought was too small and petty to take up, the German took up, because it was the only thing he was then capable of, and he worked up the pound to make it of use. We in England had now to reverse the thing, and build up the small chemical industry upon the heavy one we had established. There was nothing in the state of the chemical industry in England to lead one to be pessimistic in the slightest degree. As long as they brought brain and practical ability to bear upon the problems with which they had to deal, Englishmen always came out on top, because they had a practical instinct. Some Englishmen in the past had thought they could depend upon rule of thumb and push, but they found they could not do it. Such societies as the Chemical Society were getting them away from that idea. They must realise that what they wanted was scientific training as well as practical push. As soon as it was spread throughout the length and breadth of the land, and manufacturers realised that any kind of chemical problem could be best dealt with by scientific men, England would go ahead in a remarkable degree. In science, and science associated with practical knowledge, the future of England rested. They could not as a small nation afford to lose any advantage of that kind. The student members of that society were going out to carry the watchword of science and scientific thought in every branch of industry, and he was perfectly confident that if they carried out that work as their forefathers had carried it out, no fears need be held of a great future prosperity for the chemical industries of the Empire.

Professor Donnan said it was a source of extreme gratification to all of them that so many distinguished gentlemen whose names were connected with the industries of this neighbourhood and the North of England—which were the best industries of England—should have accepted their invitation and favoured them with their presence. There was, for instance, Dr. E. K. Muspratt, who had given the magnificent Muspratt Laboratory, which was an act of quite unexampled generosity. Very few people knew what Dr. Muspratt had done on behalf of the University, and especially in guarding the rights of chemists and of science. He invariably kept a friendly eye on the advancement of science in the University. Another of their guests, Mr. Eustace Carey, had recently received a very high honour in being elected President of the Society of Chemical Industry.

Manganese in Spain.—The Spanish Asturian Mines Company, which works the manganese mines at Enolace, near Covadoang, produced 24,000 tons of manganese oxide during the year 1906-7.

The Malaysian Tin Output.—The following figures, furnished by U.S. Vice-Consul-General G. E. Chamberlain, of Singapore, show the output of tin from the Federated Malay States for the first four months of the years 1906 and 1907. The figures represent tons of 2,240 pounds:—1906: Perak, 8,076; Selangor, 5,255; Negri Sembilan, 1,500; Pahang, 636; total, 15,467. 1907: Perak, 8,187; Selangor, 5,067; Negri Sembilan, 1,386; Pahang, 623; total, 15,263.

COMMERCIAL ORGANISATION IN INDIA.

FOLLOWING our remarks in a recent issue on British trade with India, a passage from a report by the United States Consul-General is of interest. The Consul-General states that Indian business men have organised Chambers of Commerce, and describes the workings of these bodies. Any question of large importance affecting commercial and trade matters is taken up by this organisation and thoroughly discussed, and if it is desirable to call the attention of the Government thereto, action either through a committee or by an address to the authorities is taken. In this way Indian commercial opinion is brought to bear on the Government in England, and in giving publicity in England to Indian mercantile problems. This body or organisation have recently been considering how to make their methods more effective, and after mature consideration of the question have concluded that what is most needed at this time is a Home Committee of the Indian Chamber of Commerce, to have its headquarters in London, and whose work shall be on the lines of the West Indian committee. Just how to constitute such a committee is the perplexing question. It is thought that the committee should be made up of representatives of the Indian Chambers of Commerce, to be selected by and to be representative of the different Chambers. In this manner it is believed that any friction arising between mercantile opinion existing in India and in England could be minimised. The conclusion is that such an organisation in London, supported by the whole mercantile public in India, would be able to accomplish better results than an independent body not directly responsible to the organisation of the Chambers of Commerce in India.

NITRATE OF SODA.

THROUGH an obvious printer's error, the "visible supply" for Europe was stated in our last week's review of the nitrate position as 786,260 tons, instead of 486,260 tons, consisting of 323,860 tons afloat and 162,400 tons in store, correctly given. Out of 234,000 tons "loading" for Europe on November 1st, only 75,300 tons had sailed up to the 15th inst., and the whole month's shipments are officially estimated at 222,500 tons, against 198,409 tons last year. With a view to supporting the market, every advantage will no doubt be taken of "surf days" and other means of retarding vessels, and the chances are that the actual total will, as so frequently happens, be below the mid-monthly estimate. Ships have been freely chartered at advancing rates to load the enormous quantity of nitrate ready for shipment, but there are still 140,000 tons register of disengaged shipping on the West Coast. There is no change to report in the market, which remains weak in all positions, with prices nominal in the absence of buyers. Ordinary quality is down to 10s. 10½d. per cwt. in Liverpool, and spring delivery is offered at the equivalent of 10s. 9d. in Hamburg. Arrivals are on a large scale, and are difficult to distribute on account of the existing congestion at the principal ports; one large cargo has accordingly been ordered from port of call to Nordenham, which is already overstocked, and two others (7,000 tons together) to Saint Nazaire. Nitrate for prompt shipment from Chili is offered at 8s. 1½d. per quintal, f.o.b., equal to about 9s. 10d. per cwt., cost and freight, or fully 3d. per cwt. under the quotation on this side.

TURPENTINE AND ROSIN.—According to the *Revue des Prod. Chim.*, the Union Resinera Espanola produced last year 3,982 tons of turpentine oil, of which about 2,490 tons were exported, principally to the North of Europe and Switzerland. Of the 14,601 tons of rosin produced by this company during the same period, 3,535 tons were exported, mainly to England.

THE CHINESE CAMPHOR INDUSTRY.

BEFORE the cession of Formosa to Japan, that island was the principal Chinese camphor-producing centre. After the cession the Province of Fuhkien began to be exploited, and during 1906 a great development of the industry took place, not only in the interior, but in the port of Foochow itself. In his report on Chinese trade, Sir Alexander Hosie, the British Acting Commercial Attaché, states that young as this industry is, it appears to be doomed to a premature death, for while the old camphor trees are rapidly disappearing at the hands of the camphor distiller, no replanting is taking place, and five years are assigned for the total disappearance of the tree and the extinction of the industry. Not only is camphor distilled from the camphor-wood tree chips up country, but the oil resulting from this distillation is brought to Foochow in air-tight old kerosene tins, re-distilled, and made to yield some 50% of its weight in camphor. He continues:—"I visited one of these distilleries (there were said to be seventeen owned by Chinese, and others by Japanese) and found distilling in full swing. A brick platform about six feet high contained on one side the furnaces, on the top of which, in two holes, rested two metal retorts with copper worms descending into a cold-water tank forming the other side of the platform, whence two short pipes connected with the worms, projected about a couple of feet or more above ground. The oil was poured into the retorts, which were then stoppered, and the distilled oil, after passing through the worms, was caught in kerosene tins, which were then placed in shallow concreted tanks, filled with water reaching to about the middle of the tins. There they are allowed to stand for 24 hours, during which a certain amount of camphor is deposited in the bottoms of the tins. The oil is then poured off and re-distilled as many as sixteen or seventeen times, until the camphor has all been extracted. The cold-water tank was supplied with water from a pool, over which a staging surmounted by a small wooden reservoir, connected by pipes with the cold-water tank, was erected; the reservoir was filled from the pool. The whole equipment of the distillery was exceedingly primitive, and steam was even rising from the cold-water tank. Surely science could provide a more effective method of extracting the camphor from the oil without the labour of distilling sixteen or seventeen times. The oil camphor is mixed with the camphor from up country."

The camphor shipped from Foochow in 1906 amounted to 13,535 cwts., against 4,805 cwts. in 1905, and the average of 1,574 cwts. in the quinquennial from 1901-05. Kwangsi also produces camphor, and 914 cwts. were shipped from Wuchow to Hong-Kong during the year. Of this, 879 cwts. came under transit pass from Nan-ning (597 cwts.), Pose (261 cwts.), Lungchow (12 cwts.), and Hsünchow (1 cwt). The total export of camphor from China during the year amounted to 17,652 cwts., of the value of £215,734., against 6,384 cwts., valued at £54,732., in 1905. The camphor is mostly shipped to Hong-Kong, whence it finds its way to India.

The British Consul at Foochow also refers to this remarkable boom in the export of camphor from that port. This article first appeared in the Customs Returns in 1902, and the export amounted to only 222 piculs. In 1903 it was 1,444 piculs; in 1904, 1,210 piculs; and in 1905, 4,036 piculs; while in 1906 the export more than trebled that of the previous year. It is stated that at the present rate of tree-felling for distillation of the wood chips, the supply will be exhausted in five years, and the industry will be extinct, for young trees are not being planted, and a tree takes 40 years to grow before reaching camphor-yielding condition. At present, too, large quantities of the camphor oil—the residue from the native distilleries in the interior—are brought to the port in old air-tight kerosene tins and distilled, the oil after sixteen or seventeen separate distillations depositing in cooled receivers, after each distillation, a certain amount of camphor, aggregating a total of about 40 to 50% of the oil's weight. The resulting camphor is mixed with the camphor distilled in the ordinary way and brought down from the interior. Distilling from camphor oil was started by Japanese, who own several distilleries, but the Chinese have now as many as seventeen, and others are in process of construction. They are very primitive establishments, each containing a couple of retorts,

Digitized by Google

and there appears to be much waste of time and labour due to the crudity of the system employed. Steam, for example, was rising from the cooling tanks in which the copper worms were immersed. Several British merchants at Foochow informed me that owing to the frequent fluctuations in the value of camphor, they preferred to take no part in this trade. Most of the Foochow output falls into the hands of Parsee merchants in Hong-Kong, by whom it is exported to India.

DYEWOODS IN JAMAICA.

THE Jamaican output of logwood represents about one-fifth of the world's supply. The logwood tree attains an average height of 20 to 30 feet. Its usual age, when felled, is 10 years. When prepared for the market the logs are cut to suitable lengths, and the bark and inner layer of whitewood removed. For many years logwood was exported from Jamaica only in its crude state, but recently factories have been established on the island for the purpose of extracting the colouring matter from the wood, and exporting it to the U.S.A., Great Britain and Germany, where it meets with a ready sale. There are two concerns in Jamaica devoted entirely to this business, one of which started 18 years ago upon local capital. During 1906 this company exported to the U.S.A. $205,293. worth of logwood extract, and in addition made large shipments to Great Britain and Germany. The other factory is controlled by English capital. Since its establishment, the consumption of logwood has increased, with the consequent advantage of higher prices to the grower.

In addition to the large quantities of dyewood directly consumed by the local factories, large quantities are exported, as shown by the following table (taken from a report by the United States Consul at Kingston) showing the logwood exported from each port in the island for the four years 1902-06, and for six months in 1906-07 :—

	1902-3. Tons.	1903-4. Tons.	1904-5. Tons.	1905-6. Tons.	1906-7. Tons.
Kingston	3,616	3,944	1,597	2,000	636

VEGETABLE AND ESSENTIAL OILS IN CHINA.

THE exports of vegetable oils from China in 1906 were 661,392 cwts., of the value of 4,865,173 Haikuan taels (£800,726.), an increase of 149,455 cwts. as compared with 1905, and nearly 31% in advance of the average of the five years from 1901-05. They consist of bean, groundnut, tea, wood and other oils. The British Acting-Commercial Attaché at Peking observes in his report that it would be a great convenience if the customs would endeavour to classify these oils and give each class its respective value, for the lump value of different kinds of oils is of no use to anyone who wishes to find the price of, say, bean or wood oil. Such an inquirer may be referred to the returns of individual ports, but unless the particular oil is an export from Tientsin, Shanghai, Hankow, or Canton, he will find merely a list of the principal exports, with quantities, but no values. This might be remedied by an extended list in the abstract of statistics without very much trouble or inconvenience.

Wood oil has come into great prominence in recent years as a varnish and paint oil, and has created a considerable amount of interest in America, Europe, and other parts of the world. The tree from whose fruit it is obtained is *Aleurites cordata* (? Fordii), a native of the Yangtse and West River Valleys. His Majesty's Consul-General at Hankow reports the total export of wood oil from that port as 563,706 cwts., and he places the value (c.i.f.) in Europe or America at £35. per ton, but there are no figures to show how much of the oil was sent abroad ; while His Majesty's Consul at Wuchow reports that 48,329 cwts. passed through the Imperial Maritime Customs destined for foreign countries—in other words, Hong-Kong. Complaint is still made of the adulteration of this oil with bean and other oils, a practice whose continuance will inevitably check the development of an industry capable of great expansion.

The export of essential oils (aniseed, cassia-leaf, etc.) advanced from 611,066 to 945,200 lbs., and the value from £71,920. to £109,061. These are also products of the West River, and the export, under the cognisance of the Imperial Maritime Customs, to Hong-Kong through the port of Wuchow was 2,557 cwts., made up of 2,431 cwts. of aniseed and 126 cwts. of cassia-leaf oil. Most of the latter is shipped by junk to Canton, whence it is exported to Hong-Kong for further distribution. A certain quantity finds its way to Macao as well as to Hong-Kong.

THE MINING INDUSTRY IN JAPAN.

IN a pamphlet recently issued by the Japanese Bureau of Mines it is stated that the distribution of minerals and mineral deposits is peculiar to the Inner and Outer Arcs forming the chief geological feature of the Japanese Islands. The Outer Arc is comparatively perfect in geological formation, the sedimentary rocks composing it being symmetrically developed. The Inner Arc, on the other hand, is complicated in formation, and abounding in dislocations and eruptive rocks. Metalliferous veins are mostly met with in the region of the Inner Arc ; while metalliferous beds are chiefly found in the sedimentary formations of the Inner Arc. Metal-bearing veins generally exist either in eruptive rocks or else in the Tertiary formation, but are also found in Palæozoic rocks.

The principal mines working such veins, according to the *Iron and Coal Trades Review*, are as follows :—

Gold mines : Hashidate, in Echigo ; Yamagano, in Satsuma ; Zuiho and Kinkwaseki, in Formosa. Gold-silver mines : Sado, in Sado ; Ikuno, in Tajima ; Innai, in Ugo ; Ponshikaribetsu, in Hokkaido. Copper mines : Ashio, in Shimozuke ; Osaruzawa, Ani and Arakawa, in Ugo ; Okoya, in Kaga ; Obiye, in Bitchu. Lead mines : Hosokura, in Rikuzen ; Kamioka, in Hida. Antimony mines : Ichinokawa, in Iyo. Tin mines : Taniyama, in Satsuma.

Of the metal mines existing in Japan, copper mines are the most numerous, the discovery of new copper veins being not infrequent, even at present. The copper ores of Japan very often contain more or less of gold or silver.

Of the metalliferous beds, cupriferous pyrites beds are markedly developed in the crystalline schist and the Chichibu systems, while beds of iron ore are especially rich in the Chichibu system. Beds of cupriferous pyrites are widely distributed, being found in the Provinces of Totomi, Kii, Awa, Iyo, Hyuga, and Higo. The Hibira and Makimine copper mines in Hyuga, and the Itsuki copper mine in Higo, are the principal copper deposits in the Chichibu system. Similarly the principal copper mines

Digitized by Google

belonging to the crystalline schist system are Higashivama, in Awa; Besshi, in Iyo; and Kune, in Totomi.

The beds of iron ore exist principally in the form of either magnetic or micaceous iron, and are found somewhat transformed by the action of the granite with which the beds are generally found. The principal iron mines are those of Kamaishi and Sen-nin, in Rikuchu; Akadani, in Echigo; Nakakozaka, in Kozuke, etc. Manganese ore generally exists in the Mesozoic system in the shape of irregular masses. The principal non-metalliferous deposits in Japan are coal and petroleum. They are found chiefly in the Inner Arc, where the Tertiary formation prevails, while stratified metalliferous beds are found in the Outer Arc. In Formosa, however, the coal-bearing beds are found in the Tertiary formation existing in the Outer Arc region.

Of the metalliferous deposits, those forming impregnations are especially found in the north of the Inner Arc. At the Kosaka mine, in Rikuchu, which has recently become one of the most important copper-silver mines of Japan, though it was a worked-out silver mine, ore deposits, locally known as "Kuromono" (black ores), are being mined.

MINERALS IN AUSTRALASIA.

THE American Consul at Newcastle, New South Wales, reports a large addition to the value of the mineral production in 1906. The mineral output of the State for the year was valued at $40,848,120. This is an increase over that for 1905, which previously stood as a record, of $5,418,655. In the course of the years 1905 and 1906 the mineral industry has thus shown an expansion of $8,889,300. The aggregate value of all minerals won in this State to the end of 1906 was $862,801,910. The total number of persons employed in and about the mines of the State during the year is estimated at 42,546, being 3,614 in excess of the number employed in 1905.

The gold produced to the end of 1906 amounted to 12,786,638 ounces fine, valued at $271,570,810. The yield recorded for 1906 was 253,987 ounces fine, valued at $5,394,330.; this was 20,280 ounces fine, and $430,735. in value less than in 1905. These figures do not, however, accurately reflect the position of the industry, as gold to the further value of $800,590. was purchased from the mines within this State, but was not lodged at the mint and could not be included in the official figures for 1906. This gold has, therefore, to be carried forward to the year 1907. The yield was contributed by the established mines, no new find of importance having been recorded during the year. The value of the exports from the silver-lead mines is as follows:—Silver, silver-lead, concentrates, ore, etc., $14,314,865.; lead (pig), $5,420.; zinc (spelter and concentrates), $1,464,030., a total value of $15,784,315. This exceeds the value of the output for 1905 by $2,194,995., and since the year 1903 the value of the output has increased by $7,651,435.

The value of the output of copper was $3,947,635., an increase of $1,310,620. on that of the previous year. The tin and tin ore produced during the year was valued at $1,278,720., and was in excess of that of the previous year by $148,170. This output exceeds that of any other year since 1888. The value of the output from the tin fields of the State to the end of 1906 is $38,722,545., and the number of men employed in this branch of the industry during 1906 was 3,795, an increase of 911 compared with the previous year.

THE ST. PETERSBURG CHEMICAL LABORATORY COMPANY made a profit of 51,200 roubles (£5,120.) in 1906 working year, and will pay a dividend of 5¼%.

RUSSIAN SALT.—The Odessa salt industries (says the *Torg. Prom. Gazeta*) have produced about 2,500,000 poods in the season, which has been a fairly productive one; nevertheless, the prices have been well maintained throughout. A report from Astrachan says that the Baskuntchak salt producing season has closed. The stocks on hand are about 11,000,000 poods. The despatches still continue, and it is calculated that the total despatched during the season will reach 24,000,000 poods = 390,000 tons. The season opened with high prices; but these gradually fell away. Thirty-three treasury salt-bearing areas were put up to auction on October 24, and all were bid for at rentals varying from 10 roubles, 80 copecks (20s. 10d.) to 46s. per 1,000 poods (16 tons) of salt produced, with a minimum guaranteed annual production of 50,000 to 100,000 poods, according to the importance of the area.

Continental Notes.

IN the *Chemiker-Zeitung* for October 30, November 2, and November 9, Dr. A. Mailhe writes on a new method for causing organic compounds to combine with hydrogen, use being made of finely divided metals as catalytic agents. This method, which was invented by Prof. Paul Sabatier, consists in passing the vapour of the organic compound, together with purified hydrogen gas, over finely divided metallic nickel, cobalt, or copper, which is heated to a suitable temperature in a glass tube. By this means it is possible to operate on a fairly large laboratory scale, and even on a small manufacturing scale, and the yields obtained are in many instances far better than by the old methods of reduction with sodium amalgam in acid or alkaline solution, or with iron and acetic acid, or zinc and hydrochloric acid. To carry out a catalytic hydrogenisation, nickel or copper oxide is introduced into a tube and heated to 350° or 400° C., and hydrogen is led over it until the oxide has all been reduced to metal, that is, until the escaping gas contains no water vapour. The metal, which is in an extremely finely divided state, and is strongly pyrophorous, is allowed to cool in the stream of hydrogen; it is then heated to the required temperature, and the hydrogen, together with the vapour of the compound, is led over. This temperature depends upon the reaction that is to be effected, and must be rigidly adhered to, as the molecule will be destroyed if the temperature rises too high. Of the different metals, nickel is the most active, then cobalt, and finally copper. The stream of hydrogen is to be regulated in such a way that but little of the gas escapes from the tube. The reaction may be allowed to proceed continuously day and night, with but little supervision. The hydrogen is purified by washing it with sulphuric acid and caustic soda, and then leading through a tube heated to redness and containing copper borings. This is necessary in order to remove all impurities, which would impair the activity of the metal. But in spite of these precautions it eventually becomes inactive, and has to be resuscitated by dissolving in nitric acid, igniting the nitrate to produce the oxide, and then reducing as before in hydrogen. Traces of chlorine and bromine are particularly deleterious. For instance, nickel had been in use for ten days for the reduction of phenol, without any perceptible falling off in the activity. It then happened that some bromine was used in the laboratory, and traces of it must have been dissolved in the phenol, although it could not be detected by analysis, for the action immediately ceased. Many instances are given with details of the addition of hydrogen to such compounds as ethylene, benzene, and phenol esters. In some cases quite different compounds can be produced by merely varying the temperature.

In the issue of October 30 there appears a note by O. Vogel on the history of the magnetic concentration of ores. He points out that in a work published by Balthaser Rössler, in 1700, the use of the magnet is recommended for the separation of tin stone from ironstone. This was carried out both in the dry and wet state.

G. Buchner writes briefly on the saponification of beeswax, and brings forward figures to prove that if the determination be carried out properly, quite reliable values for the saponification equivalent can be obtained; it makes no difference whether the wax be boiled with the alcoholic potash for one hour or three. He takes 3.6 grammes of wax, 70 c.c. of alcohol (96%), and about 33 c.c. of a half-normal solution of caustic potash in absolute alcohol.

The issue of November 2 contains a paper on new solvents for use in dissolving organic substances. There are various objections to the use of all the solvents now usually employed. Benzene and carbon bisulphide are dangerous on account of their inflammability, whereas the uninflammable carbon tetrachloride, in the presence of water, attacks iron, copper, and zinc, and even the expensive lead-lined plant has only a limited life. There are, however, now on the market a number of compounds of carbon, hydrogen, and chlorine, which are derived from acetylene tetrachloride (symmetrical tetrachlorethane). These compounds are: Dichlorethylene, boiling-point 55° C.; trichlorethylene, b.p. 88°; perchlorethylene, b.p. 121°; tetrachlorethylene, b.p. 147°; pentachlorethane, b.p. 159°; and, finally, hexachlorethane, which is a solid, and can in many instances be used as a substitute for camphor. The three ethylene derivatives are practically indifferent to iron, copper, lead, and zinc in the presence of water, and are not affected by acids and alkalies. They do not act chemically upon fats or oils in the presence of

Digitized by Google

metals. Trichlorethylene is especially useful on account of its convenient boiling point. It is practically insoluble in water, and is easily distilled off with steam. Tetrachlorethane is also an excellent solvent for fats, oils, and resins, and also for cellulose acetate, which is coming into use in the celluloid industry. It is the best known solvent of sulphur, with which it mixes in all proportions at temperatures above 120°.

In the same issue W. Bremer describes a new apparatus for the rapid determination of the dry substance in wheat gluten.

SMOKE ABATEMENT.

In the course of a lecture on smoke abatement, delivered recently in Manchester, Mr. R. H. Clayton, Vice-President of the Manchester Chemical Club, said that he hoped to show that many of the efforts made to solve this problem had been very misguided. The solution of the smoke problem must come by attacking the domestic fire. He agreed with Dr. Bailey and other authorities that about 70% of the smoke in the atmosphere was from domestic chimneys, and the rest from factories. People were apt to consider that the whitish domestic smoke was not so noxious as the smoke from the factory chimneys, but some results he had got would show that it was more so. Taking the average consumption of coal for domestic purposes as 1½ tons per head per annum, the total annual consumption for England would be 50,000,000 tons altogether. The coal consumed by factories, chemical works, iron foundries, and other trades amounted to 65,000,000 per annum, but a great deal of this was used for purposes which were absolutely smokeless. Take, for example, the Mond gas plants; these in the neighbourhood of Manchester alone would account for 1,000,000 tons a year, and the process was completely smokeless. Another cause which was bringing about the diminution of factory smoke was the growing use of mechanical stokers. Mr. Clayton instanced the two chimneys of the Salford Corporation electric lighting station, where mechanical stokers were used; it was marvellous how little smoke was emitted; one might almost imagine they were never working there. It was the same with the Manchester electricity works. These two establishments alone accounted for about 100,000 tons per annum. Only part, therefore, of coal used in factories, etc., was burnt in a smoke-producing way. On the subject of the waste of fuel involved in the emission of smoke, Mr. Clayton said that the percentage of loss from this cause in the case of a factory chimney was very small; it could be calculated as one, two, or three per cent. of the fuel, whereas the loss in the case of a domestic chimney was something like 50%.

Mr. Clayton then endeavoured to demonstrate by an interesting series of analyses that the pollution of the atmosphere in Manchester was mainly from domestic smoke. The distinctive characteristic of domestic smoke is that it is laden with oily hydrocarbons (tarry oils) and ammonia, owing to its being produced at a low temperature, whereas factory smoke is nearly all pure carbon. In the following table of analyses of domestic smoke, factory smoke, and the Manchester atmosphere, these constituents are calculated according to the proportion they bear to the amount of pure carbon:—

Origin	Carbon.	Hydrocarbons. Acid Constituents Soluble in Caustic Soda.	Hydrocarbons. Tarry Oils Soluble in Benzene.	Ash.	Ammonia Calculated as Ammonium Sulphate.
Domestic soot....	100	34.7	29.5	40.7	61.4
Do. (Knecht)	100	23.7	28.3	40.6	28.3
Boiler soot—					
Avg. of 36 hours..	100	0.24	1.73	26.2	—
Avg. of 4 days ...	100	0.3	2.2	43.6	4.6
Chimney emitting dense smoke for 3 hours	100	0.26	4.45	11.3	3.13
Manchester air—					
Analysis by Bailey.	100	—	36.6	94.0	—
Deposit on air filters—

Do. week-end..	100	18.3	24.7	94.2	18.8
Manchester snow—					
Whitworth-street (Knecht)	100	—	7.7	115.0	0.62
Cheetham Hill (Irwin)	100	—	14.2	91.0	—

The analysis of the polluting matter in Manchester air shows that it approximates most nearly to domestic smoke, as shown by the amount of tarry oils, ammonia, and other constituents that are characteristic of domestic smoke. The comparatively innocent appearance of a domestic chimney was due largely to the fact that a large amount of the smoke came off in the form of these oils, which, when in a hot and vaporous state, were colourless, not black like factory smoke. Another reason for the better appearance of domestic smoke at the actual moment of being poured out was that it was diluted with a much larger amount of air. Ten times as much air in proportion to the amount of coal burned passed up a domestic chimney as passed up a factory chimney. Pointing to a diagram of an ordinary domestic grate and a gas retort, the lecturer observed that they were constructed on very much the same principle. Both were distilling the coal, but in the one the products of distillation were poured into the air, in the other they were collected and used as valuable industrial materials.

In calculating the cost of the smoke nuisance, Mr. Clayton pointed out that if we put the cost of extra cleansing, etc., at only a halfpenny a day per head, it worked out at £500,000. a year for Manchester alone. After reviewing various possible solutions, he said that coke and gas were the most promising. But gas at 2s. 3d. a thousand, or anything over 2s., was too heavily handicapped. They ought to endeavour to supply gas as cheaply as possible. Manchester spent £64,000. a year on the purification of sewage to prevent the pollution of the rivers; on the other hand, they were handicapping the much more important purification of the atmosphere by taking £60,000. a year out of gas for the rates.

Reports of Companies.

RUSSIAN PETROLEUM AND LIQUID FUEL CO., LTD.

A meeting of shareholders was held on Monday last to authorise the directors to apply the investments of the reserve fund in accordance with a scheme to be submitted to the meeting. The Hon. E. Hubbard, chairman, presided.

The Chairman said that the board thought the time had now arrived when the shareholders should be asked to decide one way or the other. Agitation indefinitely continued must be fatal to the company. He proceeded to reply to current criticisms on the management, which attributed the present position of the company to contracts made. Those contracts were three in number, and he contended that each was fully considered before it was entered into, and that it was entered into in the best interests of the company. The trouble which the board found itself in was due to the strikes and troubles in Russia, and the falling off in the production. The shareholders must clearly understand that at the present moment the most pressing difficulty was that of finance, and that further working capital before the New Year was imperative. The board did not take up any non-possumus attitude. He quite understood the dissatisfaction of a great many shareholders at receiving no dividend. He felt it himself, but he also knew that there was a certain number of shareholders who considered that they wanted more direct representation on the board. If that was so, and if this meeting should think it would meet their interests to accept two gentlemen, he would say on behalf of the board that they were perfectly ready to accept their names provided they had business capacity and experience, and were willing to bring a fair and impartial mind to bear on the problems before the company. He would propose in that case to adjourn the preference meeting for eight days, so that the new directors would be able at once to get to work.

A motion of no confidence in the directors was moved and seconded, but withdrawn. The Chairman then put a resolution that had been submitted deprecating the continuance of the agitation, and requesting the board to continue in office. On a show of hands the Chairman declared that there was a majority against the board, and a poll was demanded.

Mr. Lever did not think a useful object would be served by taking a poll, and asked that the meeting of the preference shareholders be held.

The Chairman said he knew that the great bulk of the shareholders were in favour of the present board. The proxies so far handed in in their favour were 563,988, and none had been handed in on the other side. He therefore declared the resolution carried.

Digitized by Google

A meeting of preference shareholders was then held to consider, and, if approved, to pass a resolution empowering the board to apply from the investments of the preference shareholders' reserve fund any sum required not exceeding £52,500. to the redemption of first debentures on or before 1st January, 1908. The Chairman mentioned that the vote they were asked to give was a very important one, and one which might be very decisive of the future of the company. He and his family held some 20,000 preference shares, so it was not likely that he was proposing anything which would be against the interests of the company. He proposed that the meeting be adjourned for eight days, and that two gentlemen should be selected to represent them in regard to the financial position. The names of Mr. Lever, Mr. Burke, and Mr. Shaw Kennedy were proposed and agreed to, and the meeting was then adjourned.

LONDON NITRATE CO., LTD.

The directors recommend a final dividend on account of the year to June 30 of 10s. per share, free of income tax, making (with the 5s. interim dividend paid May 1) 15s. for the year. The sum of £10,000 has been appropriated to reserve fund and £2,976 carried forward.

Our Book Shelf.

DYEING IN GERMANY AND AMERICA, WITH A CHAPTER ON COLOUR PRODUCTION. By Sidney H. Higgins, M.Sc. Pp. 112. Manchester: The University Press. 1907. 1s. net.

This volume forms No. IV. of the "Gartside Reports on Industry" made by the Gartside Scholars at the Manchester University, and contains the impressions of a tour in Germany and the United States in 1905-06. The author explains that he originally intended to avail himself of the statistics of the imports and exports of the countries under consideration, but the fact that the figures are so unsatisfactory in general; that they can be so differently interpreted; and that England, which caters principally for home consumption, has no adequate record of home trade, led him to abandon the idea. He observes, however, that the figures for aniline compounds are certainly of importance, but they are not issued separately, and therefore no satisfactory conclusion can be arrived at. Nor can a country's prosperity be gauged by merely examining the returns of imports and exports. The home consumption is of importance, insomuch as the English aniline colour industry would be considered highly prosperous if we supplied our own needs and there were no imports or exports. Likewise America might be flourishing, and yet have little or no foreign trade. In reading figures it must always be remembered that the main quantity of business is local, and that exchanges take place more between the members of a community themselves than between the community and the outside world.

The book under review is divided into ten chapters. In Chapter I the distribution of the industry in Germany and America is considered, together with the development of the art of dyeing, the influence of chemistry, the opposition to progress, hank dyeing, and washing and cloth dyeing. Chapter II. deals with cop dyeing; Chapter III. with sulphur colours and indigo; Chapter IV., mercerising; Chapter V., bleaching; Chapter VI., the industry in the United States—American conditions, such as scarcity of labour, the lack of specialisation, and the effect of the tariff, being considered. Chapter VII. deals with the industry in Lowell, Lawrence, and Fall River (Mass.). In Chapter VIII. such questions are dealt with as the injurious conditions of work in the industry, and the comparison of these conditions in England, Germany, and America, wages in the three countries, short hours, etc.

In Chapter IX. the author deals with the question of efficiency in the industry. He considers that Germany is in many respects a few years behind this country; in some of the branches it is highly developed, but in general development he considers that we lead. Mr. Higgins observes that we hear much about the application of chemistry to art in Germany, but he did not find that the Germans employed more scientific skill in dyeing. The wages paid in the industry are too small to command the best skill, and this drifts to the colour works. The author goes on to record his impressions that the responsible positions in the American calico printing works are often filled with Englishmen, English machinery has been largely used, and Englishmen are being brought over to teach in the textile schools. It is also interesting to learn that empirical methods are as prevalent in America as they are here, although, of course, he found some of the dyeworks in America conducted on thoroughly scientific lines. It is also gratifying to learn that, in the opinion of the author, as far as the dyeing industry is concerned, the exhortations sometimes addressed to us to reform our methods do not urgently call for attention.

A chapter on colour production completes a very interesting report, and there can be no doubt that the impressions received by carefully trained men such as the Gartside Scholars, and recorded in this manner, are an important contribution to the study of international industrial conditions.

CHEMICAL HANDICRAFT: AN ILLUSTRATED AND PRICED CATALOGUE OF CHEMICAL APPARATUS AND REAGENTS. Pp. 615. London: John J. Griffin and Sons, Ltd.

Griffin's "Chemical Handicraft" is too well-known to our readers to require any introduction. The new edition now before us forms a very complete catalogue of chemical and physical apparatus. The volume comprises well over 600 pages, and it will find its accustomed place on the laboratory shelves.

Answers to Correspondents.

We cannot undertake to reply to correspondents through the post. Those of our readers who have addressed queries to us should look in this column for a reply.

G. C.—We think that the British Xylonite Co., Hale End, London, E., would be able to supply the material.

A. M. AND CO.—Messrs. Rose, Downs and Thompson, Ltd., Old Foundry, Hull, will be able to supply the oil presses you require.

F. B. AND G., LTD.—The makers of "Carbolacene" are Messrs. W. and F. Walker, Colonial House, Liverpool. "Solignum" is made by Messrs. Major and Co., Sculcoates, Hull.

H. N. (BERLIN).—Our annual tables of imports of chemicals, published in our 1907 Special Issue, contain some of the figures for which you ask. Nitric acid is not shown separately in the official returns, and we are not aware of any reliable figures of production and consumption in this country.

PEASE AND PARTNERS.—The directors have resolved to pay (on the 16th December) an interim dividend on the ordinary shares of 8s. per share, equal to 4%, being at the rate of 8% per annum.

THE NEW PATENTS ACT.

PART I.—(*Continued from page 423.*)

Miscellaneous.

37.—Where, after the commencement of this Act, a patent is granted to two or more persons jointly, they shall, unless otherwise specified in the patent, be treated for the purpose of the devolution of the legal interest therein as joint tenants, but, subject to any contract to the contrary, each of such persons shall be entitled to use the invention for his own profit without accounting to the others, but shall not be entitled to grant a licence without their consent, and, if any such person dies, his beneficial interest in the patent shall devolve on his personal representatives as part of his personal estate.

38.—(1.) It shall not be lawful in any contract made after the passing of this Act in relation to the sale or lease of, or licence to use or work, any article or process protected by a patent to insert a condition the effect of which will be—

(*a*) to prohibit or restrict the purchaser, lessee, or licensee from using any article or class of articles, whether patented or not, or any patented process, supplied or owned by any person other than the seller, lessor, or licensor or his nominees; or

(*b*) to require the purchaser, lessee, or licensee to acquire from the seller, lessor, or licensor, or his nominees, any article or class of articles not protected by the patent;

and any such condition shall be null and void, as being in restraint of trade and contrary to public policy.

Provided that this subsection shall not apply if—

(i) the seller, lessor, or licensor proves that at the time the contract was entered into the purchaser, lessee, or licensee had the option of purchasing the article or obtaining a lease or licence on reasonable terms, without such conditions as aforesaid; and

(ii) the contract entitles the purchaser, lessee, or licensee to relieve himself of his liability to observe any such condition on giving the other party three months' notice in writing and on payment in compensation for such relief in the case of a purchase of such sum, or in the case of a lease or licence of such rent or royalty for the residue of the term of the contract, as may be fixed by an arbitrator appointed by the Board of Trade.

(2.) Any contract relating to the lease of or licence to use or work any patented article or patented process, whether made before or after the passing of this Act, may at any time after the patent or all the patents by which the article or process was protected at the time of the making of the contract has or have ceased to be in force, and notwithstanding anything in the same or in any other contract to the contrary, be determined by either party on giving three months' notice in writing to the other party; but where any such notice is given determining any contract made before the passing of this Act, the party giving the notice shall be liable to pay such compensation as failing agreement may be awarded by an arbitrator appointed by the Board of Trade.

Legal Proceedings.

(3.) Any contract made before the passing of this Act relating to the lease of or licence to use or work any patented article or process and containing any condition which, had the contract been made after the passing of this Act, would by virtue of this section have been null and void may, at any time before the contract is determinable under the last preceding sub-section, and notwithstanding anything in the same or any other contract to the contrary, be determined by either party on giving three months' notice in writing to the other party, but where any such notice is given the party giving the notice shall be liable to pay such compensation as, failing agreement, may be awarded by an arbitrator appointed by the Board of Trade.

(4.) The insertion by the patentee in a contract made after the passing of this Act of any condition which by virtue of this section is null and void shall be available as a defence to an action for infringement of the patent to which the contract relates brought while that contract is in force.

(5.) Nothing in this section shall—

(*a*) affect any condition in a contract whereby a person is prohibited from selling any goods other than those of a particular person; or

(*b*) be construed as validating any contract which would, apart from this section, be invalid; or

(*c*) affect any right of determining a contract or condition in a contract exercisable independently of this section; or

(*d*) affect any condition in a contract for the lease of or licence to use a patented article, whereby the lessor or licensor reserves to himself or his nominees the right to supply such new parts of the patented article as may be required to put or keep it in repair.

39.—(1.) The comptroller shall, in proceedings relating to an opposition to the grant of a patent or to an application for the amendment of a specification or the revocation of a patent, have power by order to award to any party such costs as he may consider reasonable, and to direct how and by what parties they are to be paid, and any such order may be made a rule of the court.

(2.) If a party giving notice of opposition to the grant of a patent or to the amendment of a specification, or applying to the comptroller for the revocation of a patent, or giving notice of appeal from any decision of the comptroller, neither resides nor carries on business in the United Kingdom or the Isle of Man, the comptroller, or, in case of appeal to the law officer, the law officer, may require such party to give security for costs of the proceedings or appeal, and in default of such security being given may treat the proceedings or appeal as abandoned.

40.—The law officer may examine witnesses on oath and administer oaths for that purpose, and may make rules regulating references and appeals to the law officer and the practice and procedure before him under this Part of this Act; and in any proceeding before the law officer under this Part of this Act, the law officer may order costs to be paid by either party, and any such order may be made a rule of the court.

41.—(1.) An invention covered by any patent applied for on or after the first day of January one thousand nine hundred and five shall not be deemed to have been anticipated by reason only of its publication in a specification left pursuant to an application made in the United Kingdom not less than fifty years before the date of the application for the patent, or of its publication in a provisional specification of any date not followed by a complete specification.

(2.) A patent shall not be held to be invalid by reason only of the invention in respect of which the patent was granted, or any part thereof, having been published prior to the date of the patent, if the patentee proves to the satisfaction of the court that the publication was made without his knowledge and consent, and that the matter published was derived or obtained from him, and, if he learnt of the publication before the date of his application for the patent, that he applied for and obtained protection for his invention with all reasonable diligence after learning of the publication.

42.—A patent shall not be held to be invalid on the ground that the complete specification claims a further or different invention to that contained in the provisional, if the invention therein claimed, so far as it is not contained in the provisional, was novel at the date when the complete specification was put in, and the applicant was the first and true inventor thereof.

43.—(1.) If the person claiming to be inventor of an invention dies without making an application for a patent for the invention, application may be made by, and a patent for the invention granted to, his legal representative.

(2.) Every such application must contain a declaration by the legal representative that he believes him to be the true and first inventor of the invention.

44.—If a patent is lost or destroyed, or its non-production is accounted for to the satisfaction of the comptroller, the comptroller may at any time seal a duplicate thereof.

45.—(1.) The exhibition of an invention at an industrial or international exhibition, certified as such by the Board of Trade, or the publication of any description of the invention during the period of the holding of the exhibition, or the use of the invention for the purpose of the exhibition in the place where the exhibition is held, or the use of the invention during the period of the holding of the exhibition by any person elsewhere, without the privity or consent of the inventor, shall not prejudice the right of the inventor to apply for and obtain a patent in respect of the invention or the validity of any patent granted on the application, provided that—

(*a*) the exhibitor, before exhibiting the invention, gives the comptroller the prescribed notice of his intention to do so; and

(*b*) the application for a patent is made before or within six months from the date of the opening of the exhibition.

Digitized by Google

(2.) His Majesty may by Order in Council apply this section to any exhibition mentioned in the Order in like manner as if it were an industrial or international exhibition certified as such by the Board of Trade, and any such Order may provide that the exhibitor shall be relieved from the condition of giving notice to the comptroller of his intention to exhibit, and shall be so relieved either absolutely or upon such terms and conditions as may be stated in the Order.

46.—(1.) The comptroller shall issue periodically an illustrated journal of patented inventions, as well as reports of patent cases decided by courts of law, and any other information that he may deem generally useful or important.

(2.) Provision shall be made by the comptroller for keeping on sale copies of such journal, and also of all complete specifications of patents in force, with any accompanying drawings.

(3.) The comptroller shall continue, in such form as he deems expedient, the indexes and abridgments of specifications hitherto published, and shall prepare and publish such other indexes, abridgments of specifications, catalogues, and other works relating to inventions, as he thinks fit.

47.—(1.) The control and management of the Patent Museum and its contents shall remain vested in the Board of Education, subject to such directions as His Majesty in Council may think fit to give.

(2.) The Board of Education may at any time require a patentee to furnish them with a model of his invention on payment to the patentee of the cost of the manufacture of the model, the amount to be settled, in case of dispute, by the Board of Trade.

48.—(1.) A patent shall not prevent the use of an invention for the purposes of the navigation of a foreign vessel within the jurisdiction of any of His Majesty's Courts in the United Kingdom, or Isle of Man, or the use of an invention in a foreign vessel within that jurisdiction, provided it is not used therein for or in connection with the manufacture or preparation of anything intended to be sold in or exported from the United Kingdom or Isle of Man.

(2.) This section shall not extend to vessels of any foreign state of which the laws do not confer corresponding rights with respect to the use of inventions in British vessels while in the ports of that state, or in the waters within the jurisdiction of its courts.

(To be continued.)

Indian Notes.

A NEW Bacteriological Department for India on a permanent basis has been sanctioned.

Large orders have been sent to South America from India for nitrate for the cotton fields.

The Chinese merchants in Rangoon propose establishing a Chinese Chamber of Commerce.

The appointment of Inspector-General of Excise and Salt has been created, at a salary of Rs.3,000. monthly.

Japanese merchants are capturing the Indian and Chinese trade by the facilities they give to the buyers.

The Mysore State Geologist is proceeding to Italy, to study the new invention of smelting iron by electricity.

From January 1 next a royalty of Rs.10.0 per 100 viss (a viss equals 3.125 lbs.) will be levied on all lac exported by sea from Burma.

The value of the imports into India during the month of August, compared with the corresponding months in 1905 and 1906, shows a remarkable development, *viz.*:—Chemicals, drugs, narcotics, etc., 1905, Rs.11,471,186.; 1906, Rs.11,818,707.; 1907, Rs.14,232,595. Mineral and other oils: 1905, Rs.11,356,265; 1906, Rs.12,306,966.; 1907, Rs.15,694,665. The exports of manganese have increased, the figures being, 1905, Rs.1,495,433.; 1906, Rs.2,761,910.; 1907, Rs.3,857,236.

Investigations are proceeding on the suitability of Indian bauxite for the manufacture of alumina, the utilisation of by-products in coke making, the ores suitable for the smelting of copper and the manufacture of copper sulphate and sulphuric acid, the question of importing the richer and purer ores of iron, and the manufacture of iron and steel in India, the comparison of Indian manganese ores with those received from other parts of the world at the steel works in the North of England, etc.

The Secretary of State has sanctioned the appointment of a second Inspector of Explosives in India, whose duties will be identical with those of the present Inspector of Explosives.

The factories in Bombay increased last year by 40, making a total of 495, employing 212,637 persons; those in Madras increased by 6, making a total of 100, employing 43,108, while in the United Provinces the increase was 21, making a total of 154, employing 47,809. Commercial enterprises in India require vigorous development, according to English commercial standards. With the great extension of factories, the need of organising them on up-to-date systems has arisen, and any practical assistance is welcomed.

THE FRANCO-BRITISH EXHIBITION.

ON Thursday last, in the grounds of the Franco-British Exhibition at Shepherd's Bush, representatives of the most influential journals of Great Britain and France made an inspection of the buildings, etc., which are now in active course of preparation. After the inspection a luncheon was held, presided over by the Duke of Argyll.

The progress made with the constructional work of the Exhibition was summed up by Sir John Cockburn in responding to the toast of "Success to the Exhibition," in the phrase, "A whole city is arising before our eyes."

In a letter addressed to the Duke of Argyll, His Majesty the King expressed the pleasure with which he learned that the minimum sum necessary to guarantee the expenses had been subscribed, and commended to the support of the French and British people an exhibition having for its object the commercial prosperity of the two nations. His Majesty added that he sincerely hopes it may be the means of strengthening the friendship which so happily exists between them.

Trade Notes.

CANADIAN OILFIELDS.—The report for the year ended June 30 states that the profit and loss account, after payment of debenture interest, shows a disposable balance of £1,102., of which the directors propose to appropriate £250. towards writing off the formation account, and to place £750. to the credit of depreciation and reserve fund, leaving £102 to be carried forward. The accounts will not admit of the payment of a dividend on either the preference or the ordinary shares.

PROPOSED TRADE-MARK LAW IN SOUTH AMERICA.—The Buenos Ayres *Herald* publishes, in a recent issue, an article dealing with a movement to reform the present system of registering trade-marks. The journal says:—"The Liga de Defensa Commercial (League of Commercial Defence) has petitioned Congress to reform the Trade-Marks Act, with a view to preventing and punishing the frauds now being perpetrated under the existing law. The Liga limits its proposals to the three following fundamental points:—The fraudulent appropriation of established trade-marks; the registration of foreign trade-marks; the filling of recipients bearing a genuine trade-mark with spurious products. One of the amendments calls for the registration of a trade-mark only to those who can produce proof of being *bona-fide* manufacturers, tradesmen, agriculturists, or proprietors, and shall be denied to all persons not being any of these. Another proposed change is that a lapsed trade-mark cannot be re-registered within one year in those cases where the rightful owner has neglected to effect the new registration in proper time. Another important amendment makes it a crime to 'refill with spurious products recipients bearing a trade-mark pertaining to another owner, or to refill them with products that do not conform to the genuine products set forth in the trade-mark on said recipient, or to mix genuine products with others of a different or spurious kind, or to knowingly sell such spurious products in vessels bearing another's trade-mark, or mixed, etc.'"

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in or connected with Methods of Chemical Analysis C. H Ridsdale, of Ferndale, Linthorpe, Middlesbrough September 26, 1906.

The inventor claims :—(1.) The process of preparing chemicals for use in analysis, which consists in taking reagents or groups of reagents in bulk and accurately weighing out and measuring them with mechanical precision into definite measures, blocks, tablets, or the like (those reagents not interfering with each other being supplied where practicable in the same tablet or group) in which each reagent or each group of reagents shall be in its requisite proportions relative to the others and to a given definite weight of the substance to be analysed to produce a given definite result with that definite weight of the sample of the material to be analysed. (2.) Reagents for analysis made in advance in definite quantities, each forming links in the chain of operations in the analysis to be performed, each being adjusted in relation to the others, and to a definite quantity of the substance to be analysed the solids being formed in tablets or the like in special quantities, and the liquids measured in special measures of the required size, adjusted for the amount of the measurement of the one definite quantity only, which is required, all being so proportioned as to produce definite results with a definite weight of the substance to be analysed. (3.) As an instance of the working of my process, the estimating of the amount of phosphorus in steel or other carbide of iron or body containing phosphorus, in the following manner :—To a given definite weight of steel or other body to be analysed, adding a measured quantity of nitric acid and hydrogen peroxide (previously mixed in bulk) from a special measure arranged to give a given exact quantity, being that quantity necessary to dissolve that particular given weight of steel or equivalent body, and leave the required excess of nitric acid, then adding the given amount of nitrate and chloride of ammonium formed into a pellet that is necessary for the satisfactory precipitation when using the said definite quantity of the material to be tested, then after boiling off the excess of oxygen precipitating by the ordinary method by the addition of molybdate of ammonium.

An Improved Process for Abstracting from a Liquid Gases dissolved therein. J F. P. Kestner, 7, Rue de Toul, Lille, France. British Patent, 1,843. Date claimed under International Convention, January 24 1906.

This invention consists broadly in bringing the liquid in an atomised state into intimate contact with atmospheric air or a gas other than that to be removed from the liquid. The inventor observes that if a small quantity of water in an atomised or very finely divided state resembling a fog or mist be intimately mixed in a recipient with a volume in excess of a gas soluble in water, the gas dissolves instantly in the water up to saturation point, which only varies with the temperature and the pressure under which the experiment is made. The water which will collect at the bottom of the recipient will be in this state of saturation. If, again, the soluble gas in question instead of being pure is mixed with a gas which is not soluble in water, and a small quantity of water is atomised in an atmosphere of this mixture, the water which will collect in the recipient will no longer be saturated, whatever be the excess of the gaseous volume. In following up these experiments it will be found that for each state of dilution of the soluble gas in the inert gas there is a corresponding state of saturation of the water which has been brought into contact therewith. Inversely, if an aqueous saturated solution of the gas in question is atomised in an atmosphere of this same gas at the same temperature, the solution which collects at the bottom of the recipient will be found not to have lost any gas, but to be in exactly the same state of saturation as it was before atomisation. But if the solution be atomised in an atmosphere consisting wholly of the inert gas, the solution after atomisation will be found to be saturated to a less extent, a certain proportion of the volume of gas having escaped and passed into the inert gas; and it will be observed that the greater the volume of inert gas in comparison with the volume of atomised water brought into contact therewith, the less saturated will be the aqueous solution remaining. For each relative proportion of atomised water and inert gas there is a corresponding state of saturation which is clearly defined and invariable, all things remaining equal otherwise. There evidently exists here a state of equilibrium analogous to that which is brought about when two solvents are placed in contact with a soluble substance, the two sharing in proportion to the masses in contact. The greater the mass of inert gas in the case in question relatively to the liquid mass, the less soluble gas will the liquid be able to retain.

The inventor bases on these facts a continuous process for the treatment of liquids by gases for the purpose of practically instantaneously abstracting from a liquid, by means of a gas, another gas, even if the latter gas is much more soluble than the first. For example, to remove from water in which they are dissolved such gases as ammonia, chlorine, or sulphuretted hydrogen, which are all very soluble in water, all that is necessary is to atomise the water in the presence of a very large volume of air. Volatile solid substances or volatile liquids, such as carbonate of ammonia, hydrocarbons and the like, can likewise be removed from water by the same process. Atmospheric air being very slightly soluble in water, takes here the role of the inert gas. The essential condition is that the volume of air be sufficiently great relatively to the volume of water. Taking as a specific example, the abstraction of ammonia from an aqueous ammoniacal solution, the invention may be readily carried out by atomising this solution by means of a Kestner

Digitized by Google

centrifugal atomiser in a current of air. If, for example, the proportions of air and water be 180 volumes of air to 1 volume of ammoniacal water containing 2 grammes of ammonia per litre, it will be found that the ammoniacal water after purification does not contain more than 0.015 grammes of ammonia per litre, *i.e.*, 99.25% of ammonia has distilled and passed into the air, and on the other hand the water will not be saturated with dissolved air. If the proportions be 300 volumes of air to 1 volume of the same ammoniacal water, only about 5 milligrammes of ammonia will remain after atomisation. By passing this air over sulphuric acid, all the ammonia may be recovered in the form of sulphate, so that this process is practically a cold process for the recovery of ammonia contained in ammoniacal liquors. Numerous gases or volatile antiseptics are soluble in water, such as chlorine, the nitrous oxides, the phenols, formols, etc.; and, given as stated above that air employed in relatively great volume displaces soluble gases and volatile products from water, it will be seen that waters may be treated with these antiseptics without inconvenience. All that is necessary is to atomise the treated water with air in excess to the desired extent, in order to displace the antiseptic completely, or to leave in the water only such minute traces that they cannot be readily detected.

Method of Deodorising and Desulphurating Mineral Oils. G. H. Hellsing, Rabäck, Sweden. British Patent, 9,180. Date claimed under International Convention, April 30, 1906

Many mineral oils, natural as well as such obtained artificially by dry distillation from different raw materials, especially oils containing a large part of sulphur, have the disadvantage in refining that the products obtained give off a rank and disagreeable odour, from which it has been impossible, by the methods hitherto practised, to free them. On account of this odour being largely dependent on the presence in the oils of certain sulphurous organic compounds, it is also obvious that the sulphur contained in the oils will form a great obstacle to their use, especially so far as oils to be burnt are concerned.

The object of the present invention is to remove from this said kind of oils, by a simple procedure, the sulphurous malodorous matters. The method is based on the fact that salts of heavy metals, especially salts of copper, mercury, and cadmium, take up and absorb, when acting upon such oils, the kind of sulphurous organic compounds mentioned. The invention consists chiefly in treating the oil, at a certain stage of the refining, with a more or less concentrated solution of a metallic salt or metallic salts in water, for instance, by shaking the oil for some time with the solution. This mixing process can be performed in the same kind of apparatus and in the same manner as the treatment with acids and alkalies always forming an integral part of the refining of most raw mineral oils. In case other salts than chlorides of the metals are used for the treatment, preferably also an appropriate quantity of some chloride of alkali or of ammonium should be added to the solution. After treatment the oil is separated and the refining is continued in the usual way.

Improvements in or relating to Apparatus for Mixing Liquids and Gases. B. Leuschner, 29, Zahnsgasse, Dresden. British Patent, 5,189 March 4, 1907

This invention relates to an apparatus for intimately mixing liquids and gases of that kind in which the gas issues from a central pipe and the liquid from a vessel surrounding the pipe, the arrangement of the outlets from which the gas and liquid proceed being such that the jets of fluid travel in an oblique direction contrary to one another, so that a thorough mixture is insured. According to the present invention the passages for the egress of the gas and liquid are formed as slots situated in planes arranged obliquely relatively to the direction of flow of the substances. In this way not only complete independence as regards the shape of the mixing vessel is attained, but it is also possible, by the suitable arrangement and oblique position position of the inlet planes, to give the fluids any desired direction, and also to produce any desired number of bodies of fluid which, by a suitable choice of the inlet points, are preferably distributed in the mixing chamber in such a manner that one of the bodies of fluid moves in a direction contrary and against that of the other or others. In this way the mixture of the substances becomes still more thorough.

OLIVE OIL ADULTERATION IN SPAIN.—At a general meeting of producers of olive oil which was held recently in Madrid it was decided to suppress the mixing of oils from oleaginous seeds with olive oils intended for export.

RUSSIAN METALS.

THE *Torg. Prom. Gazeta* observes that in Russia such animation prevails in the copper smelting works as has rarely been known in the country. The recent high prices gave an impetus to the business, the results of which are only being realised now. The smelting of copper grows at an accelerated pace. The whole copper industry is becoming consolidated, and there is observed a tendency to combine in syndicates, and to emancipate the country from the domination of the foreign market by erecting electrolytic plants. The importation of copper into Russia is declining rapidly. For the first seven months of this year it amounted to only 200,000 poods (3226 tons), as compared with 520,000 poods (8,484 tons) in the corresponding period of last year, and 724,000 poods (11,077 tons) in 1905 (first seven months). On the other hand the export is becoming appreciable: thus in the first seven months of 1905 it was valued at £700, but the corresponding movement in 1906 was 600,000 poods (9,785 tons) valued at £8,300, and in 1907 it was 692,000 poods (11,080 tons) and £55,760.

The remarkable rise (about 20%) in the value of mercury leads a Russian correspondent to observe that when other metals were rising mercury was lifeless, but now it revives as other metals fall. He adds that no doubt the rumours about the proposed sale of Russia's only mercury works is connected with the improved market. The journal has the following note on this topic:—"The reports regarding the sale to a foreign company of A. A. Auerbach's mercury business in the village of Nikitoff, in the Bachmut district, are not devoid of foundation. As a matter of fact negotiations are being conducted with foreigners, and not long ago English capitalists visited the Auerbach factory with the object of thoroughly inspecting it. As to whether a transaction is likely, or how soon, is not yet known."

The *Uralsky Krai* observes that platinum continues distinctly on the decline. The Ekaterinburg agents who purchase for export are holding rigidly aloof. There has been no business in platinum on the local bourse for some time. The price for light platinum containing 83% metal is given at 5 roubles, 15 copecks per solotnik.

THE LABOUR MARKET.

THE Memorandum prepared by the Labour Department of the Board of Trade for the *Board of Trade Labour Gazette*, on the state of the labour market, states that employment in October was, on the whole, not quite so good as in September. There was a decline in the metal and engineering industries, but some improvement in the woollen and worsted trades and in the boot and shoe trade. Coal mining continued very busy, and the building trades dull. Compared with October, 1906, there was some decline in the building, and metal, engineering and shipbuilding trades, and an improvement in the textile trades, and in the boot and shoe trade.

In the 272 Trade Unions, with a net membership of 638,788, making returns, 30,079 (or 4.7%) were reported as unemployed at the end of October, 1907, compared with 4.6% at the end of September, 1907, and 4.4% at the end of October, 1906.

Trade Disputes.—Thirty-one new disputes began in October, as compared with 29 in the previous month, and 24 in October, 1906. The total number of workpeople affected by disputes, which began or were in progress during October, 1907, was 20,266, or 9,433 more than in September, 1907, and 8,094 less than in October, 1906. The aggregate duration of all the disputes of the month, new and old, amounted to 129,500 working days, or 57,400 more than in September, 1907, and 284,800 less than in October, 1906. Definite results were reported in the case of 27 disputes, new and old, directly affecting 2,975 persons. Of these 27 disputes, 10 were decided in favour of the workpeople, 10 in favour of the employers, and 7 were compromised.

Changes in Rates of Wages.—The changes reported in October affected 68,700 workpeople, of whom 68,200 received advances and 500 sustained decreases. The number whose wages were increased included over 41,000 coal miners in Northumberland, 8,000 blast-furnacemen in various parts of England and Wales, and over 7,000 building trade operatives in Liverpool and Birkenhead. The total computed effect of all the changes reported was a net advance of about £5,000 per week.

COTTON-SEED OIL IN TURKEY.

"TURKEY presents a double possibility for the use of cotton-seed oil, in being both an olive-producing country and a Mohammedan nation, with whom the use of lard in cooking is forbidden. At the present time there appears to be some prejudice against the employment of this product," says United States Ambassador Weishman in a report to the State Department. "I recently heard that the natives of one of the islands of the archipelago had threatened to cut down their olive trees in case cottonseed oil should be admitted, without realising its utility to them as a wholesome adulterant, in the same way as the Italian olive growers have done. In order to correct such misapprehension and to spread a general knowledge of the advantages of this peculiarly American product as a cheap substitute for oil and butter, it would be of considerable advantage if a competent person could be sent here by the Cotton Seed Crushers' Association to thoroughly canvass the Turkish market."

Market Reports.

THE RUSSIAN CHEMICAL MARKETS.

The Kieff chemical report of October 31 states that for the preceding month the feeling of the market was firm, whilst carbolic acid, formalin, chloride of lime, and corrosive sublimate were very firm. The strong demand for disinfectants, in consequence of the cholera, quickly exhausted the stocks, and the local holders were obliged to send their renewal orders by telegraph for goods to be despatched by fast train. Of this the makers took advantage and raised the prices. Consequently, disinfectants early in the month rose high. The wholesale prices are quoted as follows:—Nitric acid, 40° B., 6 roubles 25 copecks; borax crystals, 5r. 40c.; white lead, 6r. 50c.; zinc white, 7r. 60c. glycerine, 29° B., 14r. 25c.; wood spirit, 10r.; chloride of lime, 3r. (as compared with 2r. 15c. in September); carbolic acid, in casks, 50°, 4r. (compared with 2r. 50c. in September); 100° 8r. (compared with 5r. 60c.); crystallised, 40-42°, 23r.; alum, 1r. 95c.; sulphate of copper (Swedish) 8r. 50c.; sal ammoniac (English) 7r.; Caucasian potash, 3r. 40c.; caustic soda, in casks of 20 poods, 3r. 40c.; calcined soda, in casks of 30 poods, 1r. 55c.; Berthollet salts, 12r. 80c.; citric acid, 49r. 75c.; tartaric acid, 29r.; corrosive sublimate, in powder and lumps, 3r. 50c.; Russian turpentine, 4r. 10c.; red lead, 6r. 25c.; sulphuric acid, 1r. 50c.; acetic acid, 80°, 10r.; formalin, 59r.; ether, 0.735-10 roubles—all per pood of 36 lbs.

TAR AND AMMONIA PRODUCTS.

FRIDAY.

Benzols: 90's steady at 8¾d. to 9d.; 50-90's dull at 8½d. to 8¾d., casks included. Crude tar, 14s. 6d. to 18s. 6d. per ton, Thames; 1⅛d. to 1⅜d. per gallon, delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 23s. 6d. to 24s., f.o.b.; Gas Company, 26s.; East Coast, 22s. 9d. to 23s. 3d.; West Coast, 22s. to 22s. 6d. Refined naphthalene, £6. 10s. to £8. 10s., packages included. Toluol, 90%, 10d. to 10½d.; pure, 1s. 1d., casks included. Carbolic acid, crude, 50%, 1s. 5d. to 1s. 5½d.; 60%, 1s. 7¾d. to 1s. 8d.; 75%, 1s. 11¾d., casks included. Crystals, 39-40, 5⅛d.; 34-35, 4⅞d. to 5d. Cresylic, 95%, 1s. 0½d. to 1s. 1d. Anthracene, 40 to 45% A, 1½d. to 1¾d., casks included. Pyridin, 4s. to 4s. 3d.

Sulphate of ammonia quiet. Nearest values are:—Beckton, this year, £12. 5s.; next year, £12. 7s. 6d.; Beckton terms, £12. to £12. 2s. 6d.; London, £11. 18s. 9d. to £12.; Hull, £12. to £12. 2s. 6d.; Liverpool, £12. 1s. 3d. to £12. 2s. 6d.; Manchester, £12.; Leith, this year, £12. 5s.; next year, £12. 7s. 6d.

Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 9d.; Liverpool, ordinary, 11s., and refined, 11s. 1½d. Official quotations:—Cargoes, off coast or due, 10s. 9½d.; ditto for prompt shipment, 11s. 1½d.

THE LONDON METAL MARKETS.

WEDNESDAY.

Copper: Standard brands, £58. to £58. 5s. cash, and for three months £57. 15s. to £58. Tin: G.M. quality, £135. 15s. to £136. 5s. cash, and £137. to £137. 10s. three months; English, £137; Banca, 87½fl. Lead: Soft foreign, prompt, £17. 15s.; December, £17.; January-Februray, £16. 15s.; English, £18. 5s. Spelter: Ordinary brands, November, £21. 5s., ex ship; hard, £17. 15s., f.o.b. Antimony, £36. to £38; crude, £25. to £27., c.i.f.; ore, £11. Bismuth, 6s. 6d. Quicksilver, £8. 5s.; seconds, £8. 3s. 9d. Nickel, 1s. 10d. per lb. Aluminium, £100. to £105. Wolfram, 35s. Pig-iron closing prices:—Cleveland, 51s. 1½d. cash; 49s. 10½d. one month; 49s. 6d. three months.

FERTILISER MATERIALS.

FRIDAY.

During the past week the market has been very quiet in all departments, but there is no material change in values.

No fresh transactions have transpired in mineral phosphates, but raisers seem more inclined to modify their views as regards prices.

Digitized by Google

East Indian bone meal is not quite so firm, and for shipment £4. 17s. 6d. per ton, nett cash, c.i.f. Liverpool, would probably be accepted. On spot, £5. 2s. 6d. to £5. 7s. 6d. per ton, ex store, according to quality, is now quoted.

Nitrate of soda continues a dull market, but there has been no further decline in values, which remain 11s. and 11s. 1½d. per cwt., ex store Liverpool, for ordinary and refined quality, respectively, on spot.

MISCELLANEOUS CHEMICAL MARKET.

THURSDAY.

The markets are rather quieter, and there is only a moderate inquiry for any spot requirements. In the alkali trade, there is no alteration of any material importance as regards values. Bleaching powder is nominally £4. 5s. to £4. 7s. 6d., f.o.r. Caustic soda, 70%, £10. 5s. per ton, f.o.b. Liverpool. Alkali, 58%, £4. 10s. per ton, in bags, f.o.r. Soda crystals (bags), 55s. to 57s. 6d. per ton, f.o.r. There is good active demand for saltcake, and price is firm at 42s. 6d. per ton, carriage paid usual districts. Sulphate of copper is quiet, and the price stands at £21. 5s., f.o.b. Liverpool. Prices of vitriol and muriatic acids are advanced about 2s. 6d. per ton. Chlorates are unchanged, both for prompt and forward delivery, at 3½d. to 3¾d., according to quantity and other conditions. Acetate of lime is firm in price at £12. 5s., but acetic acids are rather more freely offered and prices are rather lower. Acetates of lead dull, and prices rather lower. For prussiates of potash and soda there is a steady demand. Ammonia salts are in good general request.

LIVERPOOL DRYSALTERIES.

WEDNESDAY.

Montreal potashes nominal, with a total absence of business and nothing offering. Pearl ash also nominal. Logwood steady, but with little demand. Cutch: Values maintained at recent values. Gum Arabic in good inquiry at recent values. Castor oil firm at 3⅝d. for good seconds Calcutta on spot, and 3¾d. for November-December; French, 3¾d. for first pressure, and 3½d. for second pressure. Gambier dull, with prices given for block at 23s. to 23s. 3d. per cwt. on quay; November-December shipment, 19s. 6d.; and December-January shipment, 19s. Cubes, 28s. 9d. to 29s. per cwt., on quay. Shellac steady: Fair TN orange, on spot, 125s. to 127s. 6d., and December-February shipment quoted 109s. Glucose firm: American liquid, 43%, 12s. 6d. on spot, and 12s. for November-December delivery; for prompt shipment, 10s. 1½d., and for November-December, 9s. 7½d., c.i.f., for shipment. American powdered starch, 11s. on spot, and 10s. 6d., c.i.f., for shipment. Pearl, 10s. 7½d. on spot, and 10s. c.i.f., for shipment. Cream of tartar, 98% foreign powder, 88s. to 89s.; 95%, 86s. to 87s. Tartaric acid: English, 11½d. on spot, and foreign, 11d. Citric acid: English, 1s. 8½d.; foreign, 1s. 8¼d.

LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil quietly steady at recent quotations, sales including Grand Bassa and Dix Cove on spot at £25. 10s., and Accra, on spot, at £26. 10s., both in transit. Linseed oil quiet, at 24s. 9d. to 26s. per cwt. for Liverpool makes in export casks. Cottonseed oil in fair demand at 25s. to 26s. per cwt. for Liverpool refined in export barrels. Tallow dull. Turpentine very firm, at 37s. 6d. per cwt. for spot parcels. Petroleum in fair demand at 7d. for Russian and Roumanian, and 7½d. to 8¼d. per gallon for American refined oils. Petroleum spirit steady, at 1s. 0½d. to 1s. 3d. per gallon.

HULL PAINT, OIL, AND COLOUR REPORT.

WEDNESDAY.

OILS.—The most important changes during the week have been an improvement of about £2. 10s. per ton in turpentine, and a relapse of 5s. per ton on cotton oil. Linseed oil continues steady, and no great changes are anticipated until the Argentine crop, due in about two months time, begins to arrive; the crop there is said to beat all previous records. Speculation is limited. Amongst the principal imports here to date, as against the same time a year ago, are:—Wheat 3,694,504 qrs., against 3,414,639 qrs.; flour 181,136 cwts.; linseed 718,451 qrs., against 518,363 qrs.; rapeseed 100,524 qrs., against 104,910 qrs.; cottonseed, Egyptian, 158,430 tons, against 136,291 tons; other kinds, 131,471 tons, against 109,522 tons; oilcake 23,466 tons, against 36,006 tons; hemp 118,677 cwts., against 143,425 cwts.; olive oil 3,786 tuns, against 3,423 tuns; tar 14,809 brls., against 13,153 brls. Amongst the weekly imports are:—Lard, 4,191 cwts.; margarine, 2,741 cwts.; sugar, 33,345 cwts.; hemp, 3,829 cwts.; colours, 1,357 pkgs.; wool, 365,660 lbs.; hides, 1,084 cwts. Exports:—Oil, 10,419 cwts.; colours, 2,019 pkgs.; chemicals, 2,164 pkgs. Linseed oil, 22s. 6d., spot and month, naked; November-December, 22s. 6d.; January-April, 21s. 3d.; boiled and refined, £1. to £1. 10s. per ton extra. Exports during the week:—1 ton Belgium, 7 France, 12 Germany, 4 Norway; total, 24 tons. Refined cotton oil, 22s., spot and month; November-April, 22s. 3d., naked; casks £1., and barrels £1. 7s. 6d. per ton extra. Exports:—59 tons Belgium, 9 France, 64 Germany, 95 Holland, 2 Norway, 18 Sweden; total, 247 tons. Linseed market weaker. Indian seed 3d. weaker and La Plata 6d. dearer. Rapeseed quiet; present high prices check sales. Cottonseed: Small business passing at slightly lower prices; December shipment selling at £7. 1s. 3d. Turpentine strong, 38s. 6d. spot. Rosins unchanged. Russian turpentine again dearer. Olive oil unchanged. Castor oil firm, but no business passing.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, WEDNESDAY.

A steady firmness is the rule in the paraffin and mineral oil section, with exceptional strength in burning oils of home make the Scottish manufacturers having collectively decided to exact, for all new business, one farthing per gallon over the season's contract figures, as given below. This makes the special quality 7d. per gallon, and the ordinary 6¾d. to 6¼d., respectively. Sulphate of ammonia, spot business, f.o.b. Leith, is the least shade easier, at £12. 5s., with still nothing recorded in forward dealing. Sulphate of copper again very uncertain, due to metal market vagaries. Colour chemicals and drysalteries still lean to the easy side. The calico printers are no better off, and the dyers also could do with more of movement. Bichromates are steady at the old figures, for both potash and soda. In the heavy chemicals the only notable change is a slightly increased inquiry for forward. Values remain as before.

Chief prices current are:—Alum (in lump), £5. 5s. to £6. 5s., nett ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 15s. to £5., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3½d. to 3¾d., nett, Glasgow; creosote (ordinary coal-tar and blast furnace), 2¼d. to 2½d., naked, f.a.s. Glasgow; nitrate of soda 11s. 1½d.; paraffin scale, hard, 2d. to 2½d.; and soft, 2⅜d. to 2½d. per lb.; paraffin wax, 120°, semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¾d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating) 865°, £6. to £6. 5s.; 885°, £6. 15s. to £7.; 890-895°, £7. 10s. to £8.; prussiate of potash, 5¾d. to 6d., nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £2. 17s. 6d. to £3.; sulphate of ammonia, £12. 5s., prompt, f.o.b. Leith; sulphate of copper, £21. less 5% Liverpool, prompt.

TYNE CHEMICAL REPORT.

THURSDAY.

Market quiet, and prices unchanged. Soda crystals, locally, £3. to £3. 2s. 6d. per ton, gross weights. Caustic soda, 70%, £9. 15s., and 76-77% £10. 10s. per ton. Bleaching powder, £5. to £5. 5s. per ton. Sulphur firm, at £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per

Digitized by Google

ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £6. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—Market is rather easier, with lower quotations, and while the best collieries are well booked for this and next month, the outlook for next year seems to point to lower prices. Coke remains quiet. To-day's prices: Best Northumbrian steam, 15s. 3d. to 15s. 6d. per ton; second qualities, 14s. to 14s. 6d. per ton; small steam, 9s. 3d. to 10s. 3d. per ton; best gas coals, 15s. to 15s. 6d. per ton; Durham bunker coals, 11s. 9d. to 12s. 6d. per ton; coking coals, 13s. 6d. to 14s. per ton; household coals, 16s. to 17s. per ton; foundry coke, 19s. to 20s. per ton; gas coke, 19s. per ton.

New Companies.

Oils, Fats, and Waxes, Ltd.—Capital £2,025., in 1,000 10% cumulative preference and 1,000 ordinary shares of £1. each, and 500 deferred shares of 1s. each. This company has been formed to acquire the exclusive right to the process for refining, decolouring and deodorising oils, fats and waxes, invented by J. K. Field to develop and turn to account the same, and to adopt an agreement with J. K. Field, E. W. J. Trevor and J. Doull. No initial public issue. The subscribers are to appoint the first directors. Remuneration, £50. each per annum (chairman £75.). Registered office, 40, Dover-street, Piccadilly, W.

LATE ADVERTISEMENTS.

ANTIMONY SMELTER, 22 years' experience, seeks situation, home or abroad. Manufacturer of oxide, sulphide, and regulus of antimony from high, low, and complex ores.—"1,581," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

WANTED, a Situation as Timekeeper-clerk, and to assist manager in chemical works; eight years' experience.—R. F. Balson, 39, North River Wall, Runham, Vauxhall, Great Yarmouth.

CHLORIDE of Manganese Crystal. Very pure quality free from iron. Manufacturer of limited quantity will sell 5 tons monthly, direct to consumers on favourable terms. Home or American correspondence invited.—No. "O 1,205," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

WANTED, a Foreman for disinfectant works; state age, salary, and experience.—Apply, "1,614," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

WANTED, a Chemist well up in the manufacture of any of the finer chemicals or pharmaceutical preparations.—Apply, "1,613." *Chemical Trade Journal* Office, 265, Strand, London, W.C.

WANTED.—Large supplies of Tar Oils as used for making disinfectant fluids with coefficients 15 to 20—Send pint tin samples and quotations to R. Tetherwick, "Etheldene," 145, Ruskin Avenue, Manor Park, Essex.

CHEMIST Open for Engagement. As Head Chemist or Assistant Manager; technical training and long works experience. Expert knowledge of sugars, colours, and inorganic manufactures; research a speciality; capable analyst; home or abroad; excellent recommendations.—"F C S." Box 1,615, *Chemical Trade Journal* Office, 265, Strand, London, W.C.

A PRACTICAL Chemist with great experience in the development of new processes in the experimental stage, and a sound general knowledge of engineering, is open to appointment with enterprising firm.—Address, "No. 1,611," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

TAR Products and Gas Residuals; Gentleman, good Linguist, many years' experience in export trade, seeks appointment as Sales Clerk or Traveller.—"1,616," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C.

CURRENT TOPICS.

AN INDUSTRIAL ALCOHOL COMBINATION.

IT will be remembered that the deliberations of the Royal Commission on Industrial Alcohol resulted in the granting to manufacturers of certain concessions regarding the use of spirit, and it was expected that the Revenue Act which came into force last year would do much to equalise the conditions under which British chemical manufacturers have to meet foreign competitors. Particulars have now been made public, however, respecting the formation of a combination of the principal manufacturers of industrial alcohol, whose movements will be watched with grave apprehension by all who are interested in the question of cheap spirit.

In reviewing the position, the *Times* points out that in spite of the concession made by the Inland Revenue, users of methylated spirit are paying only 1d. per gallon less than they paid before the rebate of 5d. per gallon was allowed. One can only expect that, as a result of this closer combination of spirit-producers, the price of industrial spirit may soon be higher than it was before the Government interposed on behalf of the manufacturers. While the price of spirit for industrial purposes is advancing in this country, the price in America is decreasing, and in all probability will continue to decrease, and as a result we may expect to see a large increase in the imports from the United States of those chemicals and other goods in the manufacture of which alcohol is essential. The "free alcohol law" came into force in America three months after the Revenue Act of 1906 came into operation in this country. The effect of the law in America has been to stimulate competition and to increase the production of spirit; the effect of the levy in this country has been to check competition and raise the price of spirit. It should be stated, however, that the American law permits of the use of industrial spirit for light, heat, and motive power, and that in America producers of the spirit have been relieved of some of the restrictions which apply in this country; but the fact remains that America in the future, as a result of the new alcohol law, will be a very serious rival to British chemical manufacturers. The combination of spirit makers will also be watched with interest by those engaged in the motor industry. Although the Revenue Act did not permit of the use of industrial spirit for motive purposes, the hope was entertained that such an impetus would be given to the spirit industry that in course of time the production in this country would be enormously increased, and that ultimately the cost of production would be below the selling-price of petrol. When such a time arrived there was every probability that the Inland Revenue would have allowed the same concessions in respect of spirit used for motive-power as for spirit used for manufacturing purposes.

Digitized by Google

The writer in the *Times* goes on to observe that one effect of this new development in the industrial alcohol manufacturing industry has been to give the methylators a feeling of greater security. For a considerable time past the competition among methylators has been exceedingly keen, and prices have been cut to a point which leaves little or no margin of profit. This was due, in some measure at least, to the fact that large buyers could buy on better terms than their smaller competitors, and, of course, the lowest price made the market price. Now, however, all this is changed, and all methylators of plain British spirits will be on the same footing as regards buying terms. It is understood that a meeting of the methylators and others interested has already been held at Liverpool, and that an agreement has been come to with the view of maintaining prices at a uniform level. This is not the first agreement of the kind that has been entered into in the methylating trade; and, while the parties to it are solemnly bound to maintain its provisions, considerable doubt seems to be felt in trade circles as to how long those provisions will be honourably observed. In any case methylators are acting upon the assumption that one result of the establishment of this new selling agency by the producers of plain British spirits for industrial purposes will be an early advance in prices. The trade in industrial alcohol is a steadily growing one, although considerable disappointment and dissatisfaction have frequently been expressed at the slow progress that has been made as compared with Germany, for instance. The present German output of industrial alcohol, which is made almost entirely from potatoes, is somewhere about 50,000,000 gallons, whereas, according to the latest figures, the annual production of methylated spirits in this country is a little over 6,000,000 gallons. During the past ten years, however, methylated spirits have been coming into steadily increasing use, and foreign spirits, which were at one time methylated in this country to a considerable extent, have been entirely ousted by the home-trade article, this being due to the high prices which have latterly been ruling for German potato spirit. High hopes are entertained in trade circles that the next few years will witness a great development in the consumption of industrial alcohol as a result of the better appliances now being made for utilising it, and to the more liberal regulations regarding its manufacture and sale. So far as can be seen at the moment, the new combination is one which might be expected to work for the good of the industry if its objects were strictly adhered to. Where practically unlimited powers with regard to the fixing of prices, however, are put into the hands of any body of traders there is always the danger that these will sooner or later be abused, owing to what may be described as the natural greed for profit. In view of the efforts that are being made to encourage the use of industrial alcohol in this country by cheapening its cost and in other directions, it would be a pity if these efforts were nullified by the tyrannical impositions of a combination of manufacturers.

It would appear that in the event of the non-realisation by manufacturers of the concessions deliberately intended to be made by the Revenue Act of 1906, some further Government action will be necessary if effect is to be given to the intentions of the Royal Committee.

DEVELOPMENTS IN THE ITALIAN CHEMICAL INDUSTRY.

A report from Genoa calls attention to the rapid development which has recently taken place in the chemical industry in Italy, and to the very promising future which appears to be in store for this industry. The chief consideration that has, up to the present, stood in the way of its making any great strides, has been the high cost of coal. Now, however, that Italy is utilising to such an increasing extent its hydraulic power, this difficulty has almost vanished. The production of sulphuric acid shows a continuous advance. The statistics of production show that during the last decennial period the output has increased from 957,000 to 2,780,000 quintals. This advance is of the greatest importance to the chemical industry, as so many branches of it are dependent upon the use of vitriol. Corresponding to the larger output of sulphuric acid, a proportionate step has been made in the production of artificial manure. At present 52 large and 20 small manufactories are in existence in Italy, the greatest number of which, and the most important in point of view of production, are situated in Northern Italy, and are capable of a total production of 6 million quintals. Their actual output has risen during the last ten years from 1,457,000 to 4,591,000 quintals, and the increase is expected to continue, particularly as there is an ever-increasing demand on the part of the agricultural population. Hitherto, the use of this adjunct to agriculture has been distrusted, and the Government has taken special steps to change this attitude. Equally important for the development of the chemical industry is the increasing production of sea salt in Sicily, where it enjoys freedom from tax. This rose from 39,000 quintals ten years ago to 111,000 quintals, and an equivalent step forward has been made with the output of hydrochloric acid. The great development which has taken place in Italy in the utilisation of water-power has also enabled much larger quantities of caustic soda, calcium chloride, calcium carbide, etc., to be produced.

The manufacture of sulphate of copper has increased very considerably, the annual production having risen to 175,000 quintals from 31,510 quintals ten years ago. The article finds a ready sale in connection with vine cultivation. The production of sulphide of carbon is an industry which has been established for over forty years in Italy, and sufficient has been made during the last five years not merely to supply home requirements, but also for exportation. In the vicinity of the textile manufacturing districts, quantities of the various chemical preparations utilised in bleaching, etc., are turned out. The once prosperous Italian manufacture of refined boracic acid has been displaced by the competition of Germany and the United Kingdom, aided by plentiful supplies of the raw product from California; recently, however, renewed attention has been given in Italy to this manufacture, and the increased output, from the new factories that have been established, has met with a good demand, both for home and export. A noteworthy development has also taken place in the manufacture of carbonic acid, which now reaches about 1,000,000 kilogrammes annually.

PROFITS IN THE GERMAN CHEMICAL TRADE.

The figures quoted at the recent meeting of the Defence Syndicate of the Chemical Industries in Germany show that the German chemical trade was in a most prosperous condition in the year 1906. The number of workmen employed had risen from 188,386 in 1905 to 198,002. The wages, which reached 197,500,000 marks in 1905, rose to 217,300,000 marks in 1906; or, per head, they had increased from 1,048.23 marks to 1,097.54 marks. The importation of raw materials and semi-raw materials rose from 13,600,000 to 16,600,000 metrical quintals, whilst the exportations rose from 11,600,000 metrical quintals to 13,200,000

Digitized by Google

metrical quintals. The improvement is still more marked in the values of the exports, which rose from a total of 463,600,000 marks to 575,500,000 marks, an improvement of 23%. In spite of the increased prices of the raw materials and the decreased sale prices in some cases, the chemical industries realised greater profits in 1906 than in 1905, even although the increase in wages has been considerable. The average dividends paid by the 147 share companies, whose combined share capital is 477,000,000 marks, plus 90,000,000 marks in debentures and mortgages, and 154,000,000 marks reserve funds, was 15.07%, against 14.18% in 1905. The total dividends distributed amounted to 72,000,000 marks. Twenty-four of the companies declared no dividend; in three cases the dividend did not exceed 2½%; in eleven cases it did not exceed 5%; fifty-one distributed from 5% to 10%, twenty-five from 10% to 15%, and twenty-nine over 15%.

CHEMICALS IN CHINA.

THE most remarkable feature in the import of dyes into China during 1906 is the rapid rise of artificial indigo, which bids fair to supplant the natural blue. The latter, although it appears in the list of foreign imports, is really a Chinese product shipped to Hong Kong, mostly from the West River, for distribution to other parts of China. Artificial indigo advanced from 43,357 cwts. in 1905 to 87,914 cwts. in 1906, and in value from £259,649. to £523,403. Belgium and Germany accounted for 35,014 cwts. of the 43,357 cwts. imported in 1905, Belgium's share, practically one-half of the whole, being valued at £120,864. The strides made by the synthetic dye may be gathered from the imports during the last five years:—3,887 cwts. in 1902, 17,314 cwts. in 1903, 22,756 cwts. in 1904, 43,357 cwts. in 1905, and 87,914 cwts. in 1906. Vegetable indigo, on the other hand, which fell from 93,390 cwts. in 1904 to 90,108 cwts. in 1905, dropped to 67,836 cwts. in 1906. Mangrove bark decreased 775 cwts., while all other dyes, with the exception of vegetable indigo, increased. Vermilion, which rose from 3,960 to 4,020 cwts., is almost entirely produced in Hong Kong, where there are some ten native establishments engaged in its manufacture. The operation consists in subliming the black sulphide resulting from the heating of the sulphur with quicksilver in shallow iron pans, one inverted over the other. The red sulphide is then pounded in mortars, and ground with water in stone mills, the vermilion thus deposited being collected and dried on trays arranged in specially heated rooms. Adulteration is not unknown to the manufacturers. The value of paints and paint oil rose from £85,289. to £90,261., and was slightly ahead of the average import of the previous five years.

The following is a comparative statement of the imports of dyes, colours and paints, extracted from the annual report of the British Consul-General:—

	Quantity.			Increase or Decrease in 1906 compared with—	
	Average 1901–05.	1905.	1906.	1905. (quantity)	Average 1901-05.
Dyes, colours, and paints—					Per cent.

Paints and paint oil. Value £	89,482	85,289	90,261	+ 4,972	+ 0·86

Matches.—The decrease of 5,000,000 gross in the import of matches in 1906 is not a sign that the many native match factories scattered throughout China are successfully competing with the foreign supply. On the contrary, several of these factories have been shut down during the year, and the excess of over 5,000,000 gross in 1905 as compared with 1904, which was 4,500,000 gross ahead of 1903, clearly indicated the cause of the decline. The import in 1906 amounted to 22,998,830 gross of the value of £845,927., and was principally Japanese. Match-making materials increased in value from £40,946. in 1905 to £51,403. in 1906, and were nearly 10% ahead of the average of the previous five years.

Soap.—Soap had a set-back in 1906, but the import of 1905 was £93,627. in excess of the previous five years average, and the decline of £19,279. is not a serious matter. Soap of good quality will always be in demand in China, but it is unfortunate that very inferior imitations of the finest toilet soaps are being manufactured in the Far East and placed in large quantities on the China market. The Chinese are not yet sufficiently acquainted with those niceties which distinguish the true from the false. As regards common soap, toilet and bar, there is now a considerable output in China itself and in Hong-Kong, but there does not exist what may be called a first-class factory in the country. In two factories at Shanghai, the daily output of the larger, on an emergency, was 200 boxes, each containing 20 bars and weighing 46 lbs. The sale price per box was 1.65 Shanghai taels. The report contains an account of a visit to this works, where toilet soap was also being made, each two cakes being joined together. A box of this soap weighed 52 to 53 lbs., and cost 1.75 Shanghai taels. The ingredients used were: cocoanut oil, imported in casks containing 5 piculs, laid down in Shanghai at 14 taels per picul, including cask; animal tallow, at 9.50 taels per picul; vegetable tallow, costing 10 taels odd per picul, from Hupei (Hankow); cottonseed oil, at 7 taels per picul, procured locally; and soda from the United Kingdom, at 4 taels per picul. The proper proportions of these are mixed, steamed, and ladled into earthenware jars, whose contents are allowed time to settle before being poured into oblong wooden moulds. The block of soap is removed after 24 hours, and stacked till ready to be cut into bars by wire. The bars are then piled to dry. Before being packed in boxes the soap is stamped, a wooden block, previously dipped in scent oil, being hammered by hand along one side of each bar, leaving the maker's name in Chinese and Roman characters. In another factory the name is impressed by a machine worked by a hand lever.

Candles.—In 1906, candles shared the fate of soap, and for the same reason. Their value fell from £208,185. to £106,724., which, however, was 4.31% ahead of the average import of the previous five years. The Chinese are great candle makers, and if they used foreign wicks their present product would be incomparably better than it is. Tallow and wax candles are also made in foreign style, but on a limited scale. In one factory visited in Shanghai a candle machine, with 12 tubes, was at work, and surrounding it were boxes of stearine and petroleum wax.

The following is a comparative table showing the imports of cement, candles and soap imported during the years 1905-06:

	Av. 1901-05.	1905	1906.	1905. (Value.)	Increase or Decrease in 1906 compared with Average 1901 - 1905.
	£	£	£	£	
Candles ...	102,306	208,185	106,724	–101,461	+ 4.31%
Cement ...	42,389	83,410	142,838	+ 59,428	+236.93%
Soap.....	162,773	235,321	216,042	– 19,279	+ 32.78%

Cement.—The great bulk of the cement comes to China from Hong-Kong, where it is manufactured by the Green Island Cement Company, which secures its supply of limestones from the West and North Rivers in the Canton province. The Chinese Government are about to erect cement works on the Island of Honam at Canton. German machinery was imported some time

Digitized by Google

ago, and the contract for the erection of the works has been secured by a British firm. Chemical products (not including match-making materials, medicines and soda) increased from £37,327. to £55,811.

Sulphur increased in quantity from 34,774 to 42,920 cwts., and in value from £9,493. to £13,661. Some 400 to 600 tons of this sulphur, mainly from Japan, are imported by an acid works at Shanghai, which is engaged in turning out sulphuric, nitric and muriatic acids, which it disposes of to various Chinese arsenals for use in the manufacture of smokeless powder and for other purposes. The import of sulphuric acid increased in quantity from 21,079 to 41,242 cwts., and in value from £9,348. to £19,675. Varnish fell off in quantity, but shows an increase in gold value from £18,309. to £18,779. Woods of all kinds, exclusive of sandalwood, timber, and dye woods, rose in value from £97,251. to £122,123.

Miscellaneous.—An excellent crop of white wax was harvested in Ssuchuan in 1906, the season being particularly favourable and the insects (*Coccus pela*) abundant. The export was 6,747 cwts., against 5,072 cwts. in 1905, and was 25.55% in excess of the average of the previous five years. The bulk of the export goes to Hong Kong, whence it is distributed in Southern China. Varnish advanced from 7,897 cwts., of the value of £51,727., to 9,213 cwts, valued at £55,014. Nearly the whole of the export goes to Japan, which in 1905 took 7,324 of the 7,897 cwts. Alum has fallen off in quantity and value, while gypsum has advanced in both. Safflower, whose export in 1905 amounted to only 90 cwts., rose to 107 cwts., but the aniline dye has already done its work. The export twenty years ago was nearly seven times that quantity, and the dye is going out of cultivation in Western China. Animal tallow increased from 3,996 to 7,069 cwts., and in value from £4,782. to £7,877., while lard (pork fat) advanced from 57,191 to 59,276 cwts., valued respectively at £100,339. and £119,976. The bulk of this lard goes from the Canton delta and Shanghai to Hong-Kong, where part of it is used in the manufacture of soap.

Asbestos rose in value from £5,913. to £6,704. Gasolene, benzine, naphtha, petrol, etc., rose from £1,203. to £6,844, (Shanghai absorbing £4,170. of the total). Glue rose in value from £20,094. to £23,668. Saltpetre rose from £85,224. to £91,627. (more in quantity, but less in silver value).

The following sundry imports fell in value :—Betel nuts from £41,018. to £33,562.; gums (myrrh, libanum, etc.) declined from £9,572. to £9,166.; liquid fuel, from £4,176. to £1,688.; engine oil from £62,163. to £12,519.; perfumery from £39,473. to £34,570.; soda from £85,588. to £75,503.

Glass.—China is preparing to supply some of her own wants in the matter of glass. A glass works, with foreign plant, is being erected at Su-Ch'ien, on the Grand Canal, capable of turning out 40,000 bottles and 150,000 sq. feet of window and rolled glass in 24 hours.

Kerosene Oil.—The following is a comparative statement of the imports of kerosene oil :—

	Quantity.			Decrease or Increase in 1906 compared with—	
	Average, 1901-05.	1905.	1906.	1905 (quantity)	Average, 1901—05.
Kerosene oil—					
American .....Gallons	56,243,570	80,046,136	62,910,989	- 17,135,147	+ 11·85
Borneo ..... ,,	2,597,970	11,105,553	26,934,219	+ 15,828,666	+ 936·74
Burma ..... ,,	—	1,154,906	42,460	- 1,112,446	—
Russian ..... ,,	20,284,809	12,710,049	—	- 12,710,049	—
Sumatra ..... ,,	43,733,671	48,455,187	38,800,022	- 9,655,165	- 11·28
Total ..... ,,	122,860,020	153,471,831	128,687,690	- 24,784,141	—

The decrease in the import of kerosene oil from 153,471,831 gallons in 1905 to 128,687,690 gallons in 1906 is due, not to decreased consumption, but to heavy stocks held over at the end of 1905. American oil fell off by 17,135,147 gallons, Sumatran by 9,655,165 gallons, Burmese by 1,112,446 gallons Burma's contribution was only 42,460 gallons, and, by agreement, will soon disappear altogether. In the case of Russian oil there was a re-export of 334,000 gallons in excess of the import of 1,190,280 gallons. Borneo sent 26,934,219 gallons against 11,105,553 gallons in 1905, and 2,597,970 gallons the average of the preceding five years. The total value of the net import of all kerosene oil in 1906 was 12,578,723 Haikuan taels (£2,070,248.).

Exports.—The following were the principal articles of export in order of value :—

	Value.	
	Currency. Haikuan Taels.	Sterling. £.
Vegetable oil	4,805,173	800,726
Sesamum seed	4,512,602	742,699
Tin	3,478,834	572,558
Camphor	1,310,771	215,734
Iron, pig (manufactured and ore)	1,129,706	185,931
Tallow, vegetable	1,057,401	174,830
Nut-galls	975,597	160,602
Seed cake	856,153	140,908
Oils, essential	662,648	109,061
Cottonseed	522,325	85,966
Groundnuts	453,712	74,673
Antimony and antimony ore	390,221	64,224
Rape seed	383,169	63,863
Varnish	334,264	55,014
Zinc and zinc ore	97,457	16,039
Chinese ink	92,255	15,183
White alum	60,888	10,021
Lead and lead ore	55,196	9,084
Animal tallow	47,862	7,877
Gypsum	35,399	5,826
Quicksilver	24,315	4,002

The following were the principal exports from China to Europe and America :—

	Quantity.			Increase or Decrease in 1906 compared with	
	Average 1901-05.	1905.	1906.	1905. (Quantity.)	Average 1901-05.
	Cwts.	Cwts.	Cwts.	Cwts.	Cwts.
Nut-galls	48,825	51,332	69,142	+ 17,810	+ 41.61
Oil (bean, tea, groundnut, wood, etc.)	505,039 Lbs.	511,937 Lbs.	661,392 Lbs.	+ 149,455 Lbs.	+ 30.95 Lbs.
Oils, essential	529,593 Cwts.	611,066 Cwts.	945,200 Cwts.	+ 334,134 Cwts.	+ 78.47 Cwts.
Sesamum	574,240	685,382	1,273,997	+ 588,615	+ 121.85
Tallow—					
Animal	43,488	3,996	7,069	+ 3,073	- 83.74
Vegetable	116,617	80,092	135,784	+ 55,692	+ 16.43
White wax	5,374	5,072	6,747	+ 1,675	+ 25.55

The value of the export of Chinese produce to foreign countries in 1906 amounted to 236,456,739 Haikuan taels, or expressed in gold at the high rate of exchange ruling during the year, 38,916,838 against 227,888,197 Haikuan taels (£34,278,183.) in 1905, an increase of £4,638,655. in gold, but of only 8,568,542 Haikuan taels in silver.

(To be continued,)

SOCIETY OF CHEMICAL INDUSTRY: *London Section.*—A meeting of the Section will be held at the Chemical Society's Rooms, Burlington House, Piccadilly, on Monday, December 2. The following papers will be read and discussed :—(1) "The Estimation of Naphthalene in Coal Gas and in Spent Oxide of Iron," by C. J. Dickenson-Gair. (2) "Note on the Influence of Formal on the Properties of Funtumia Elastica," by Dr. P. Schidrowitz and F. Kaye. (3) "The Polarimetric Determination of Sucrose," by Dr. F. Watts and H. A. Tempany. (4) "Niam Fat," by Dr. J. Lewkowitsch. The meeting will commence at 8 p.m.

SPANISH TRADE IN 1906.

MALAGA.

In his report on the trade and commerce of Malaga for the year 1906, Mr. Consul Haggard states that the year was a disappointment, owing to the fall in exchange and the failure of the fruit crops, the latter being due to a prolonged drought coupled with a season of floods. The increased value of the peseta (about 25% with regard to British currency) facilitated imports in general.

Olive oil turned out an utter disappointment to all concerned, the yield being 500,000 arrobas as compared with 1,000,000 arrobas in 1905. Exports have been nil, as the whole production is required for home consumption. Prices at the same time have risen higher than for many years past. In the early part of the season prospects were favourable; but later the olives began to fall off the trees in considerable quantities, whether from the influence of the previous drought or from storms cannot be said, but probably both these circumstances contributed to the disappointing year. For the last two years, trade in sulphur (olive) oil for soap making has been almost at a standstill owing to the poor crops, and the small quantities produced have been taken up by the home industry at prices far above those offered by foreign markets; 1907 promises a good crop, and even if only 10% of the blossoms now showing give fruit, farmers are looking forward to a good year in this article.

Statistics of minerals in general are impossible to obtain, though, according to reports from shippers, trade in iron ore has decreased during the present year. An increased demand is perceptible for steatite (French chalk), of which there are mines being worked by a British firm within a few miles of Malaga. The mineral is being exported both in powder and in the unground state, which latter seems to find a good market, owing to the colour and quality of the stones.

The demand for British cement is almost nil, owing to its high price compared with that from the South of France, and from Belgium and Germany. Spain also is starting this industry in the north, and although the quality turned out is not to be compared to British, still the price offered is no inducement to the importation of British cements. The local company (Sociédad Hidro-Eléctrica del Chorro) is also about to complete a plant for the manufacture of cement, which will most probably cut down importation considerably.

The following were the principal imports into Malaga during 1906, as compared with 1905:—

	Quantities. 1906. Tons.	1905. Tons.	Increase or Decrease in 1906.
Tin	7	22	− 15
Copper, copper wire and nails	100	161	− 61
Oils, paints and pigments	393	251	+ 142
Sulphates of potash and ammonia	13,332	18,330	− 4,998
The exports were:—			
Soapstone	298	10	+ 288
Ordinary lead	35,684	40,264	− 4,580
Argentiferous lead	6,553	7,968	− 1,415
Olive oil	2,090	14,449	− 12,359
Iron ore	65,973	100,615	− 34,642

MAZARRON.

Mr. Consular-Agent Pearce reports that 14,970 tons of dry and manganiferous iron ore were exported to the United Kingdom and 13,470 tons to the Netherlands for Germany in 1906, being a total of 28,440 tons, whereas the total for the previous year was 34,980 tons, showing a decrease of 6,540 tons. The reason can be traced chiefly to the paralysis of mining operations in the Morata mines, and also to the fact that several other mines in this district are nearly worked out. The only part of the district where there is still any probability of obtaining considerable quantities of iron ore is at Morata, where, however, enterprise and capital are not forthcoming.

The lead works here produced 15,257 tons of silver-lead and 5,851 tons of soft lead in 1906; of these, 10,281 tons of silver lead and 5,851 tons of soft lead were shipped to Antwerp for the desilverising works at Hoboken, and 4,976 tons of silver-lead to those of Carthagena. In 1905 the production was 18,724 tons, of which 14,869 tons were shipped to Antwerp and 3,855 tons to Carthagena. The total output of the Mazarron lead mines in 1906 was approximately 592,300 quintals (29,600 tons), as compared with 650,500 quintals (32,500 tons) in 1905, *i.e.*, a decrease of 2,900 tons, which would indicate that some of these mines are getting worked out. A table shows the approximate output of each mine which was being worked in 1906, compared with that of 1905.

ALMERIA.

Mr. Vice-Consul Murison reports that the shipment of copper ore amounted to over 1,230 tons, an increase over last year of 840 tons, the greater part of which has been extracted from the mines being worked for calamine and lead ore, as stated in the report of last year.

The chief imports into Almeria were:—

	From United Kingdom. Tons.	From Other countries. Tons.
Bog ore	—	50
Bones, calcined	—	20
Cement	133	3,212
Chemical products	562	387
The exports were:—		
Iron ore	329,540	86,100
Lead	2	268
Zinc	—	8,138
Copper	17	1,214
Salt	1,470	30,716
Ochre	14	—

AGUILAS.

Mr. Vice-Consul Neftel reports that the exports of iron ore from Aguilas were some 40,000 tons over the figures for the previous year, due chiefly to the increase in shipments from El Hornillo, where 86 steamers loaded as against 41 at Aguilas. The United Kingdom took about the same quantity as during the previous year, but for the Netherlands the total was 39,530 tons, against 2,500 tons in 1905. With the extension of bunker room now completed at Hornillo, and the improvements at present being made in the port of Aguilas for more rapid loading, it is confidently expected that the export for 1907 will be greatly increased.

LINARES.

Mr. Vice-Consul Power reports that the exportation of lead ores and pig lead from this district amounted to 79,110 tons of the former and 56,940 tons of the latter. The total quantity of lead sheets, pipes, and shot exported by the three local works was 1,492 tons as against 2,062 tons in 1905, being a decrease of 570 tons. The total quantity of lead ore produced by the various mines in the district amounted to 149,146 metric tons. The average value of soft foreign lead in London in 1906 was £17. 7s. 3d. per ton as compared with £13. 15s. in 1905, which represents a rise of £3. 12s. 3d. per ton. The quantity of silver produced in the district as ingots may be estimated at 600,000 ozs. The price of silver showed a further rise during the year to an average price of 2s. 6.82d. per oz. for fine silver.

The total quantity of iron ore exported by the various mines in the province amounted to 72,465 tons.

ADRA.

The exports of lead from Adra were, in pigs, 1,214 tons; galena (lead ore), 88 tons.

THE SOAP TRADE OF BULGARIA.—This import is a considerable one, as the home industry is not yet in a position to supply the country's requirements. Marseilles washing soap is on the market at 58 francs, f.o.b. Marseilles, per 100 kilos., this being the most formidable competitor with the British product. Ordinary toilet soap is produced in sufficient quantities by the native industry, but there is a good deal to be done in the medium and finer kinds.

NITRATE OF SODA.

THE financial crisis in Chili is still acute, but little nitrate now remains in weak hands, and the pressure of needy holders being removed, prices have recovered to some extent. This year's shipment is quoted nominally about 8s. 6d. per quintal, f.o.b., compared with 9s. a twelvemonth ago. The Continental markets, although firmer, have not risen in proportion, spring delivery being quoted 11s. per cwt. in Hamburg, while spot is offered at 10s. 9d.; navigation on the Elbe, for some time hindered by low water, has now been resumed, and nitrate will be sent up to Magdeburg for storage, but the demand for account of consumers is still in abeyance, and the country dealers are in no hurry to buy forward. The only business passing is therefore between importers and the large speculative dealers in Liverpool, Hamburg, Antwerp, and Dunkirk. The last-named port, although it had a stock of 41,000 tons at the beginning of the month compared with 32,000 tons last year, has just received five more cargoes, the "financing" of which is under present circumstances easier there than in Hamburg. Referring to the "allegation" (*sic*) in this *Journal*, that large stocks of nitrate were accumulated in Chili, Sir Robert Harvey at Tuesday's meeting of the Lagunas Syndicate stated that the accumulation was due merely to the delay in arrival of shipping; ships were now arriving in considerable numbers and stocks were rapidly falling. This means that a much larger quantity of nitrate will be shipped to Europe within the next three months than in the corresponding period. Apropos of synthetic nitrate, Sir Robert assured the shareholders that it is so deliquescent as to have little practical value. Nevertheless some 40 pages were devoted to the subject in the last quarterly circular of the Iquique Propaganda Association!

ANTIMONY IN ASIA MINOR.

ANTIMONY ore is to be found almost everywhere throughout the N. W. portion of Asia Minor. It is of very pockety formation, and usually occurs in fissure lodes, accompanied with iron pyrites. The ore is very pure, and carries 70% of metallic antimony. The considerable fluctuation in the value of the ore is the chief reason why the production of antimony is neglected, as, owing to the difficulties of transport, it is almost impossible to deliver the ore at under $44. per ton.

With the exception of the Djinli Kaga, no machinery has been used to facilitate the production of antimony. On the Djinli Kaga mines there is a very imperfect dressing plant capable of treating 40 tons of ore a day with a loss of about 30% of the pure ore in slimes and waste. The ore from Turkey is nearly all shipped to England from Smyrna. The present value of 50% ore is about $88. a ton, but prices have sometimes gone as high as $176. The total production of the mines during 1905, according to a U.S. Consular Report, was 450 tons, of which 350 were from Djinli Kaga, and, during 1906, 830 tons, of which 780 were from the same place.

The present tendency of the antimony market is downward, and it is to be expected that, with a limited consumption of metal and a practically unlimited supply of ore, the values will very soon come back to $44. or $52.80. per ton. It has generally been the case that after every long depression there is a sudden rise in prices, which creates activity among the producers, to be followed again by another long period of low values. The average cost of producing this ore is about $44. per ton, so that usually the depression lasts as long as the mines can hold out working at a loss. The transport of antimony ore is generally made on camel back, and costs about 12 cents per ton per mile. The cost of labour is, for expert miners, 50 to 75 cents per day; timbermen, 75 to 87 cents per ton; ordinary labour, 25 to 37 cents per day. The Government charges a royalty of 5% on the gross value of the ore and a 1% customs duty. As a rule the antimony found in Turkey is free from impurities, such as arsenic or lead. The ore, however, rarely carries gold.

THE SIR JOHN CASS INSTITUTE.—The prizes and certificates won by the students of the Sir John Cass Institute, Jewry-street, Aldgate, will be distributed on Tuesday next, December 3, by Dr. R. T. Glazebrook, D.Sc. The chair will be taken by Sir Owen Roberts.

THE FOREIGN TRADE OF FRANCE.

ACCORDING to official returns recently issued, the imports into France during the first six months of 1907 amounted to £123,765,000., compared with £113,949,000. during the corresponding period of 1906, while the exports amounted to £110,424,000. against £100,957,000. The imports thus show an increase over exports of £13,341,000. Classified under the three chief sub-divisions they compare as follows with the corresponding period of 1906:—

	1907. £	1906. £
Food products ..	19,193,000	15,656,000
Raw material	82,336,000	78,548,000
Manufactures	22,236,000	19,745,000
Total	123,765,000	113,949,000

Thus showing a gross increase of £9,816,000., *viz.*, £3,537,000. in food products, of £3,788,000. in raw material, and £2,491,000. in manufactures.

The following were the principal articles of imports into France during the years 1905-06:—

	1905. £	1906. £
Olive oil	636,000	916,000
Oil seeds and nuts	7,704,000	9,248,000
Copper	4,324,000	6,588,000
Minerals of all kinds ..	4,208,000	3,926,000
Nitrate of soda	2,232,000	2,736,000
Mineral oils	2,456,000	2,120,000
Lead	916,000	1,036,000
Tin	1,312,000	1,384,000
Guano & chemical manures.	452,000	571,000
Zinc	716,000	816,000
Sulphur	532,000	528,000
Seeds	324,000	447,000
The exports were:—		
Fats	848,000	952,000
Olive oil	324,000	395,000
Chemicals	4,588,000	4,812,000
Copper and copper ore ..	1,544,000	2,054,000
Oils	1,036,000	1,212,000
Seeds	1,340,000	1,136,000
Oil cake	924,000	968,000
Saffron	136,000	137,000
Dyewood extracts	492,000	604,000
Perfumery	712,000	768,000
Colours	572,000	652,000
Soap	548,000	556,000

The imports from the United Kingdom during 1905-06 were:—

	Value. 1905. £	1906. £
Chemicals and chemical manures	913,000	888,000
Copper	395,000	588,000
Coal tar	275,000	300,000
The exports from France to the United Kingdom were:—		
Copper and copper ore ..	554,000	674,000
Chemicals	699,000	639,000
Oils—Essential	139,000	90,000
Other	221,000	282,000
Caoutchouc	533,000	858,000
Perfumery	159,000	192,000

The following table shows the principal imported articles of raw material:—

	Values. Six months, 1907.	Decrease or increase compared with 1906
Wood pulp	1,199,000	+ 48,000
Nitrate of soda ..	1,664,000	− 14,000
Oleaginous seeds ..	5,902,000	+1,078,000
Vegetable oils	713,000	+ 53,000
Mineral oils	1,460,000	+ 459,000
Minerals	2,107,000	+ 186,000
Copper	2,905,000	− 538,000

THE NOBEL PRIZE FOR CHEMISTRY.—The Stockholm *Dagens Nyheter* states that the next Nobel Prize for chemistry will be awarded to Sir William Crookes.

Continental Notes.

AN account of the proceedings of the General Meeting of the Verein Deutscher Chemiker, held at Lübeck in September, appears in *Die Chemiker Industrie* for October 1. The first item on the agenda was the report on the economical condition of the chemical industry in 1906. The General Secretary, O. Wenzel, reported that trade had been very good during the year, not only in Germany, but also in the United States, in Great Britain, France, Russia, and other countries. Only in the case of Japan was there a considerable diminution in the imports and exports. The general prosperity of the country was increased by good harvests and rising prices for agricultural produce. The rates of dividends on the shares of limited companies also showed an improvement. Amongst the other subjects which were discussed at the meeting was the creation of a chemical "Reichsanstalt," to which the Society promised a donation of 500,000 marks. Of this sum more than two-thirds had been collected. The meeting expressed itself in favour of the foundation of this institution for the assistance of chemical investigation, although a few of the members did not consider that the money was being laid out to the best advantage. They thought that better results would be obtained by the formation of a fund from which to subsidise chemical research. Another similar subject which came on for discussion was the erection of an institution for industrial hygiene. It is intended to erect this institution in Frankfort, and a small limited liability company has been formed with a capital of £5,000. to conduct it. Here all questions relating to the health and safety of workmen will be studied, books and statistics will be collected, and manufacturers will be able to consult the officials on payment of fees, which will be very small in comparison with the risks that are involved in accidents and interruptions in manufacture.

Dr. Weigelt presented his report upon the investigations he has carried out concerning the treatment of effluents. He again laid stress upon the fact that large and swift streams have a great power of taking up impurities without being perceptibly polluted, but in the case of smaller streams it is absolutely essential that the waste waters led into them shall first be properly purified. It is still an undecided point whether settling tanks ought to be shallow or deep. The material of which filters should be constructed is also a matter of controversy, but Weigelt is in favour of coke, as it can afterwards be burnt as fuel, and the deposit is thereby entirely destroyed. Instead of fixed filters, it is often advantageous to introduce fine solid matter, such as ground charcoal impregnated with iron hydroxide, to carry down the suspended solid matter.

The meeting also expressed itself in favour of the reduction as far as possible of Sunday work, although it recognised that in many cases this cannot be entirely avoided.

In the issue of *Die Chemische Industrie* for October 15 there is a description of an ingenious respirator for administering oxygen. In cases where the lungs are working there is, of course, no difficulty in stimulating the patient by means of oxygen, but where the breathing has practically ceased the oxygen cannot be got into the lungs by ordinary means. An automatic respirator has, however, now been devised by Dr. Brat, which alternately sends the oxygen into the lungs by pressure and draws out the expired gases, the compressed oxygen in the cylinder supplying the necessary energy for creating the vacuum and operating the valves. With such an apparatus it is easy to apply artificial respiration for hours if necessary. It has already been adopted in many mines and large chemical works.

The same issue contains two theoretical papers concerning the manufacture of soap, by Dr. Rohland and E. Fischer respectively. The principal point dealt with is the property of caustic alkalies to bring about the coagulation of strong soap solutions. According to Rohland, this is due to the attraction between the electric charge on the hydroxyl ions and the colloidal particles of soap, but Fischer considers it is rather due to the greater mobility of the ions in the case of the caustic alkalies. Whatever may be the proper explanation, it is certainly a very curious fact that soap is coagulated so readily by an excess of caustic. By the use of carbonate instead of caustic, the soap boiler is able to keep his charge under better control. This, and many other phenomena in connection with soap making, calls for further investigation, and will be best studied by the methods of physical chemistry.

In the issue for November 1 there is a report of the proceedings of a conference of the medical officers of chemical works, which was called by the Trade Guild for Chemical Industry, in order to consider the question of collecting statistics and data relating to the injuries caused to the health of the workers. The principal object is to disprove the exaggerated statements that appear from time to time in the Press, but the measures to be taken to prevent unnecessary injury to health will also be considered. An executive committee of four was appointed to deal with the matter.

Reports of Companies.

CASTNER-KELLNER ALKALI CO., LTD.

The ordinary general meeting of shareholders was held on the 21st inst., the Right Hon. G. W. Balfour presiding. The Chairman said that the directors had great satisfaction in meeting the shareholders at the end of a year of prosperity unexampled in the previous history of the company. The net profit amounted to £116,754., and that was the first time they were able to show a profit of six figures. Adding the amount brought forward, and deducting the debenture interest and the interim dividend paid last March, they were left with an available balance of £103,830., which the directors proposed to appropriate as follows:—£30,000. to depreciation reserve, to write £15,910. off plant and machinery account and £7,500. off suspense account, and to apply £36,000. in paying a dividend for the six months ended September 30 last, leaving £14,420. to be carried forward. The directors were unanimously of opinion that it would not be wise to place less than £30,000. annually to the credit of ordinary depreciation, but this sum did not include what was described in the report as the usual expenditure in keeping up the works, plant, and machinery to the highest state of efficiency—a large amount, which was deducted before arriving at the figure of net profit. Moreover, in the present year the directors proposed that a sum of nearly £16,000. should be written off plant and machinery, representing loss on the realisation of old plant not now required, because, with the progress of invention, they had been able to replace it by other plant which would do the same work at very considerably less cost. Of course, changes of that nature could not be made without considerable apparent loss of capital, but in these days the courage to "scrap" old plant was, perhaps, of all the qualities required in the management of an industrial company the most essential. With reference to the £7,500. written off suspense account, that account was in reality an experimental account. Experiments were sometimes fruitful and sometimes unfruitful, but they were invariably costly. There, again, however, a company like theirs, which was not prepared to spend money on experiments, was likely to be left behind. The total amount of interest payable on the debentures for the year was covered, with about 50% to spare, by the £14,000. it was proposed to carry forward, so that the year's net profit had covered the debenture interest about twelve times over. As usual, £5,000. had been applied to redeeming debentures. He urged the shareholders not to regard the dividend of 12% which they were to receive for the past year as necessarily a standard for future distributions. While, however, he said that by way of warning, he thought he might safely state that at no time had the position of the company been stronger than it was at present. In conclusion, he proposed a resolution for the adoption of the report and accounts, and the payment of the dividend therein recommended.

Mr. George T. Beilby, F.R.S., seconded the motion, which was carried unanimously.

SALAR DEL CARMEN NITRATE SYNDICATE, LTD.

An extraordinary general meeting of shareholders was held on the 21st. inst., Mr. W. T. Morrison presiding, to consider resolutions for dividing the existing £5. shares of the company into five fully paid up shares of £1. each, and for making certain alterations in the articles of association.

The Chairman, in proposing the resolutions, said that on the last occasion when he addressed the shareholders he referred to the fact that the directors had requested their agents on the coast to appoint two of the best experts obtainable to examine and report on the grounds and plant at the oficina. They advised them that the Company's plant and machinery were in perfect order, and that the grounds were to-day estimated to contain

Digitized by Google

raw material (including caliche and costra), from which upwards of seven million quintals of nitrate of soda might be extracted. Including the five million quintals already taken out of the grounds, this was two million quintals or approximately 100,000 tons more nitrate of soda than the property was originally estimated to contain. This result confirmed the statements, made to the Board, of important discoveries on the Company's property, by which the "life" of the oficina would be considerably prolonged. Inasmuch as this augmentation of their resources would justify them in making application for an increased quota in the new combination, some new plant had been ordered which would enable them still further to support their claim. The prospects of the coming year were extremely satisfactory. An interim dividend of £1. a share had been paid, and there was every reason to believe that the next dividend would be entirely satisfactory. The circular accompanying the notice explained the objects of the alterations in the articles of association.

Mr. A. Naylor seconded the motion, which was carried.

SANTIAGO NITRATE CO., LTD.

The annual meeting of shareholders was held on Wednesday last; Mr. Henry W. Lowe presiding. In moving the adoption of the report and accounts, the Chairman said the shareholders would be glad to notice that the result of the year's working was more favourable. The gross profits were £65,867., as against £58,484., notwithstanding that they produced 56,000 fewer quintals and that the cost of production was slightly higher. There was a net profit of £55,764., and after payment for repairs, etc., the sum available was £36,642., which was about £16,000. more than the estimate formed a few weeks ago. They proposed to pay a dividend of 10%, and to carry forward £16,642. They had paid off the whole of their debentures, and there would be no drag on future profits. No doubt some felt it a hardship that last year they paid no dividends, and placed £27,000. to the reserve fund, but in view of the financial crisis in Chili at the present time the course taken was of the first importance. They had put the company on a sound footing, and the average price of their sales was much above that of last year, so that altogether the prospects before them were most favourable. Without committing himself to any definite statement as to next year's dividend, he thought it could not be less than double what they now proposed. He understood that at a low estimate the life of the Santiago grounds was about fifteen years, though their manager considered it was twenty years. The prices of nitrate were lower now, but if they did not rise there would still be left a satisfactory profit, and he would be content if they never went any higher. It was sad that there was so much financial embarrassment in Chili, but the company was not affected.

NOBEL DYNAMITE TRUST.

An extraordinary meeting of shareholders was held last week, for the purpose of authorising an alteration in the articles of association previous to raising the capital of the company by £500,000. in preference shares to provide additional working capital for the subsidiary companies. Sir F. Anstruther, who presided, stated that the alteration was in effect that the preference shareholders might at any time, by resolution passed by them by a majority of not less than three-fourths, consent, on behalf of all the holders of preference shares, to the creation of issue ranking equally therewith, and such resolution shall be binding upon all holders of preference shares. He concluded by moving the necessary resolution, which was seconded by Lord Ribblesdale and agreed to.

Chemical Trade Openings in Bulgaria.—The measures which are being taken by the Bulgarian Government to foster agriculture have resulted in an increase in the demand for agricultural manures. There is still much to be done by way of instructing the uneducated farmers in methods of intensive cultivation, but the Agricultural Department has appointed numbers of travelling inspectors, who act as instructors of modern methods, and who are gradually introducing chemical fertilisers. Agricultural schools have been founded; also colleges for practical courses in fruit, wine and silk cultivation, and bee keeping, all of which are worth the attention of the seller of such goods. In addition to chemical manures, it is apparent from the import trade returns that there is much to be done in sulphate of copper, tartaric acid, citric acid, caustic and washing soda, saltpetre, sulphuric acid, and acetic acid.

Analytical Notes.

THE DETERMINATION OF INSOLUBLE MATTER.*

L. G. Eakins (*West. Chem. and Met.*, III., pp. 120-121) has described the methods in use at the Colorado plants of the American Smelting and Refining Company for the determination of insoluble matter. The methods used in the laboratories may differ somewhat in unimportant details, but in general are as follows:—Unless there is some special reason otherwise, one-half gramme is taken in all cases for the determination.

Sulphides.—Treat in a small beaker, with strong nitric acid, 7 to 10 c.c. Heat gently until strong action has ceased. Evaporate to dryness and bake until free from acid. Cool, add about 20 c.c. hydrochloric acid (one part acid and one part water) and heat until solution is as complete as possible. Filter; wash first with hot, dilute hydrochloric acid, then hot water. Ignite and weigh.

Occasionally, some ores high in zinc or lead sulphide may be treated to advantage first with hydrochloric acid, and then following as above, but the result should be the same in either case if properly carried out.

Oxidised Ores in General.—Treat with strong hydrochloric acid, 7 to 10 c.c. Boil until dissolved; add a little nitric acid (½ c.c. is usually plenty); evaporate to dryness and bake to the complete expulsion of acid fumes. Cool; take up with hydrochloric acid and proceed as with sulphides.

With some ores containing carbonaceous matter, it may be necessary to bake for a long time, as such residues often hold acid tenaciously. In the case of Leadville manganese oxides, nitric acid is omitted entirely.

Leady Oxide Ores.—Some of these, such as Midas and Percy La Salle, usually yield gelatinous silica and must be carefully de-hydrated at not too high a temperature.

Oxidised Material which has been strongly ignited.—This covers such products as Cripple Creek concentrates. Digest with hydrochloric acid without boiling at first, then evaporate nearly to dryness, add a few drops of nitric acid, and evaporate to complete dryness. Occasionally it may be necessary to repeat this treatment, which is a matter of individual judgment. Finally bake to complete expulsion of acid and proceed as before.

Roasted Ores, Acid Works' Residues, etc.—Digest with hydrochloric acid, without boiling until the oxidised portion is dissolved; add 2 to 3 c.c. of nitric acid, boil to decompose sulphides, evaporate to dryness, and proceed as before.

Ores or Products containing Magnetite.—Some mixed oxidised and sulphide ores, such as the Ibex and other Leadville ores, and also often furnace mattes, contain magnetite. When this is known or suspected, the material is treated as above under "Roasted Ores, etc.," except that nitric acid in larger quantity may sometimes be necessary.

Barium Sulphate Ores.—Treat with 10 c.c. hydrochloric acid (one part acid and one part water), boiling a few minutes, add to 5 c.c. nitric acid, and after action has ceased evaporate to dryness. Bake and proceed as usual.

After total insoluble is weighed, fuse with sodium carbonate or mixed carbonates, digest the melt with water until disintegrated, filter and wash. Wash out the fusion crucible with 3 to 5 c.c. hydrochloric acid (one to one), and with this dissolve the residue on the filter, being careful that the residue is all dissolved and the filter washed clean. Precipitate the barium in boiling solution with a slight excess of dilute sulphuric acid, and allow to stand at least two hours before filtering. The barium sulphate so obtained is deducted from the total insoluble residue.

Precautions.—Care must be taken to insure the removal of all lead salts from the insoluble residue. Filtrations should be conducted rapidly and with hot solutions, in which case washing with hot dilute hydrochloric acid is perfectly safe. However, washing with hot ammonium chloride or acetate solution is often used and has no objections. This removal of lead needs special care in barium sulphate ores, as this latter seems to render the complete solution of the lead salts more difficult.

THE DETERMINATION OF ZINC OXIDE.*

A method for the separation and determination of zinc oxide in zinc-white, zinc-dust, paints and lithopone is described by J. Tanibon in *Bull. Soc. Chim.* (Vol. 1, 1907, pp. 823-829). The principle of the separation depends on the solubility of zinc

* *From* the *Engineering and Mining Journal* (New York).

Digitized by Google

oxide in a solution containing ammonia, ammonium chloride, and ammonium carbonate. The following procedure is applicable in the separation of zinc oxide from zinc-white. A 10 gramme sample is shaken for several minutes in a stoppered flask containing 300 c.c. of an ammoniacal solution composed of equal volumes of ammonia (22° B.), 20% ammonium carbonate solution, and 20% ammonium chloride solution. The residue insoluble in this solution is washed with ammonium carbonate, boiling water, and finally with alcohol. The difference in weight from the amount originally taken is the weight of the zinc oxide, which may be titrated if desired by sodium sulphide solution. The same method may be applied to the determination of zinc oxide in zinc dust. Products such as lithopone, which contain salts soluble in water, are boiled therein and the sample is dried and weighed again before the alkaline leaching solution is applied.

THE CLASSIFICATION AND USES OF CEMENT.*

BY SAMUEL S. SADTLER.

WITH a view of classifying and studying the subject of cements, the writer has prepared the following discussion. The subject is such a broad one, embracing a wide range of chemicals and raw materials, that the scope of this paper cannot go beyond a general treatment of the question.

Besides cements in the narrow sense, there are other preparations which may also be defined and discussed.

A *cement* is a plastic or liquid substance used to join surfaces. It becomes firm or solid on setting.

A *lute* is a plastic material used for preventing or stopping leaks, and is generally used for temporary purposes. Its setting is usually of such a character that it may be easily removed.

Pastes and *mucilages* are fluid substances used for uniting paper and cloth, or fastening them to surfaces such as wood or metal.

The purposes for which this class of substances are employed are so many that there is hardly any line of work that is not in a notable measure depending upon them. It is difficult to recall any industry not requiring one or more of them.

Wood workers, masons, plasterers, plumbers, bookbinders, machinists, the metallurgical industries, manufacturers of chemicals, all industries where power is a large factor, are constant users of cements.

It can hardly be said that there is any dearth of information as to what might be used in special cases, or that there is any difficulty in procuring suitable materials for compounding, but it has been thought desirable to treat the subject in a systematic way. This might help persons to choose a cement, to compound it, and to get the best results in its use.

The fact is that there are hundreds of formulas published for making cements, where dozens would serve if careful selection were made by someone, and the result properly classified. Of those now published, too much is claimed for some, others are practically impossible, a large number are unnecessarily complicated or use expensive elements where cheaper ones would serve. These substances may do the work required, but simpler ingredients naturally suggest themselves, and the old formulas should be revised accordingly, provided tests show that the changes are safe ones to make.

SETTING.

To properly use cements it is quite important to understand the rationale of their action. With this knowledge, if the action characteristic of its setting does not proceed satisfactorily, modifications of temperature, dilution or proportions may be made, and much trouble saved thereby.

The phenomena of setting may be differentiated as follows:—(1) Evaporation, loss of water, or other solvent. (2) Hydration, taking on the elements of water. (3) Cooling. (4) Oxidation. (5) Vulcanisation. (6) Ordinary chemical action. (7) Combination process.

(1.) *Evaporation.*—In cases where setting takes place by evaporation, there are various considerations to be noted in respect to both solvent, solute materials, and insoluble filler, if any.

The chief consideration is, of course, as to whether the materials in solution or combined solution and suspension, are chemically and physically resistant to solution, corrosion or abrasion incident to their use. This matter is, however, too full of detail to be taken up at this time. As to the solvent, however, something may be said here.

Layers of cement should not be so deep as to seriously hinder evaporation, especially if the solvent is water. When water is used, unless the time of setting is not important, heat is generally present to expel it, or some corrective filler used, such as Portland cement or plaster. As the solvent goes off cracks are likely to develop if the mixture is too thin. Fibrous materials such as noted below under the head of fillers are useful for holding it together, and if the body of the cement is of soft material such as oils or soft pitch, it is especially desirable to have some inert filler present, whether fibrous or not. When the solvent is not water, choice of various organic solvents can often be made. In general, methyl (wood) alcohol and ethyl (grain) alcohol dissolve soaps, free organic acids, and some of the resins, while the other solvents dissolve, more or less perfectly, fats, oils, some resins, pitches, and asphalt.

The most important solvents are here given in the approximate order of volatility (with boiling points), solvent power and cost:

Volatility.	*Solvent Power*	*Cost.*
Sulphuric ether .....35°C.	Sulphuric ether	Sulphuric ether
Carbon di-sulphide.....46° "	Chloroform	Ethyl alcohol
Acetone .....56°C.	Carbon di-sulphide	Chloroform
Chloroform.....61°C	Carbon tetrachloride	Acetone
Methyl alcohol .....66°C.	Turpentine	Carbon tetrachloride
Carbon tetrachloride ....78°C.	Glacial acetic acid	Glacial acetic acid
Benzol.....80°C.	Benzol	Turpentine
Petroleum benzine ...100-150°C	Toluol	Denatured alcohol
Toluol .....111°C.	Acetone	Wood alcohol
Glacial acetic acid.....119°C.	Petroleum benzine	Benzol (straw colour)
		Toluol (straw colour)
Turpentine .....156°C.		Benzine
	Methyl alcohol	
	Ethyl alcohol	

A great deal could be said about these solvents. Each one in turn may be the best for certain substances. The classification as to solvent power is very crude, but may be of use at times.

Most of these substances are extremely inflammable, and form explosive mixtures with air. There are two notable exceptions, however—chloroform and carbon tetrachloride—especially the latter; it will neither burn nor support combustion.

(2.) *Setting by Hydration.*—In this case crystalline substances form *en masse* by the taking up of water. It is desirable to have as nearly the total amount of water required as possible to secure the greatest density and strength. There should not be too much inert material present to keep the particles of the setting substance apart. The more finely divided the inert material, the less can be used, as the particles of the cement itself must coat all the particles of inert material, or be between them to effect a bond. If the particles of inert material are of the same degree of fineness only an equal amount, as compared with cement, can be used. When properly graded as to fineness, from five to eight times as much by volume of the filler may be used.

The time for setting may be somewhat reduced by using warm water, and very little, if any, excess, and may be retarded by having an excess and by the use of small amounts of certain chemicals; alkaline substances, for instance, delay the setting of Portland cement and plaster. In some cases the entire amount of water cannot be used at once, or it dries out somewhat, so that subsequent wetting is necessary.

(3.) *Setting by Cooling.*—In this class are considered cements and lutes which are applied in the melted state, such as resins, waxes, bituminous bodies, solid fats, and sulphur. The great advantage of using materials in this way is that there is no loss in density, as is generally the case where the setting takes place by evaporation. The work they are applied to should be hot, however, or the setting is interfered with.

If the pieces of apparatus to be joined are small, it is usually well to heat them, as applying the cement hot is not enough to ensure a fused union of cement and work. Inert substances are almost invariably used in admixture to make the cement harder, stronger, fill voids, and to cheapen it. Clay, sand, asbestos, cement, plaster, whiting, etc., are used in this connection. Sometimes there is a subsequent chemical action, as when acid resins are used with fillers of a more or less basic character, such as metallic oxides or carbonates.

(4.) *Setting by Oxidation.*—This may take place in oil or in powdered metal. In the case of oil there is an effect of hardening, and consequent setting. With metals it causes an expansion due to increase of volume. The commonly used oils acting in this way are Chinese wood oil, linseed oil, rapeseed oil, and fish oils. In the case of Chinese wood oil the oxidation is so energetic that it is generally best to mix it with some other oil.

* A paper read before the Franklin Institute.—From the *Journal* of the Institute

Digitized by Google

Linseed oil is almost always previously "boiled" before use, and rapeseed oil is "blown."

With regard to the metal powders, iron is the chief one used, although precipitated copper has been employed, and other metals might be for special purposes. The iron used is invariably the powder resulting from the crushing and sorting of cast borings, filings or millings. They should be nearly free from oil, and the cement has the greatest expansive power when in a finely divided condition.

The value of these cements depends on the expansion taking place in a confined space, such as holes or cracks in castings. This expansion may be so powerful as to break or shatter the object upon which it is used. In such cases it can be diluted with clay or cement. When the holes in a casting are well filled with concentrated iron powder, moistened with water containing a very little salt or salammoniac, the particles adhere so firmly and the actual oxidation is so limited in actual amount, that the casting can be finished and not show where it was mended. Furthermore, the cement is not dislodged by any ordinary means.

(5.) *Setting by Vulcanisation.*—This takes place where fresh rubber is used as a cement in conjunction with sulphur or certain compounds of the same, and heated to about 120° C. which renders the rubber insoluble, firm, and causes it to lose its stickiness. Vegetable drying oils may be used, such as rapeseed and linseed oils, with sulphur chloride, dissolved in carbon disulphide, as a vulcanising agent. Hydrochloric acid gas is liberated in this reaction, and so zinc oxide or a similar base is generally used to neutralise the acid. In the vulcanisation of rubber itself, such precaution must be taken when sulphur or sulphur chloride is used.

THE NEW PATENTS ACT.

(Continued from page 474.)

Part II.—Designs.

Registration of Designs.

49.—(1.) The comptroller may, on the application made in the prescribed form and manner of any person claiming to be the proprietor of any new or original design not previously published in the United Kingdom, register the design under this Part of this Act.

(2.) The same design may be registered in more than one class, and, in case of doubt as to the class in which a design ought to be registered, the comptroller may decide the question.

(3.) The comptroller may, if he thinks fit, refuse to register any design presented to him for registration, but any person aggrieved by such refusal may appeal to the Board of Trade, and the Board shall, after hearing the applicant and the comptroller, if so required, make an order determining whether, and subject to what conditions, if any, registration is to be permitted.

(4.) An application which, owing to any default or neglect on the part of the applicant, has not been completed so as to enable registration to be effected within the prescribed time shall be deemed to be abandoned.

(5.) A design when registered shall be registered as of the date of the application for registration.

50.—Where a design has been registered in one or more classes of goods, the application of the proprietor of the design to register it in some one or more other classes shall not be refused, nor shall the registration thereof be invalidated—

(*a*) on the ground of the design not being a new and original design, by reason only that it was so previously registered; or

(*b*) on the ground of the design having been previously published in the United Kingdom, by reason only that it has been applied to goods of any class in which it was so previously registered.

51.—(1.) The comptroller shall grant a certificate of registration to the proprietor of the design when registered.

(2.) The comptroller may, in case of loss of the original certificate, or in any other case in which he deems it expedient, furnish one or more copies of the certificate.

52.—(1.) There shall be kept at the Patent Office a book called the Register of Designs, wherein shall be entered the names and addresses of proprietors of registered designs, notifications of assignments and of transmissions of registered designs, and such other matters as may be prescribed.

(2.) The register of designs existing at the commencement of this Act shall be incorporated with and form part of the register of designs under this Act.

(3.) The register of designs shall be primâ facie evidence of any matters by this Act directed or authorised to be entered therein.

Copyright in registered Designs.

53.—(1.) When a design is registered, the registered proprietor of the design shall, subject to the provisions of this Act, have copyright in the design during five years from the date of registration.

(2.) If within the prescribed time before the expiration of the said five years application for the extension of the period of copyright is made to the comptroller in the prescribed manner, the comptroller shall, on payment of the prescribed fee, extend the period of copyright for a second period of five years from the expiration of the original period of five years.

(3.) If within the prescribed time before the expiration of such second period of five years application for the extension of the period of copyright is made to the comptroller in the prescribed manner, the comptroller may, subject to any rules under this Act, on payment of the prescribed fee, extend the period of copyright for a third period of five years from the expiration of the second period of five years.

54.—(1.) Before delivery or sale of any articles to which a registered design has been applied, the proprietor shall—

(*a*) (if exact representations of specimens were not furnished on the application for registration) furnish to the comptroller the prescribed number of exact representations or specimens of the design; and if he fails to do so, the comptroller may erase his name from the register, and thereupon the copyright in the design shall cease; and

Digitized by Google

(*b*) cause each such article to be marked with the prescribed mark, or with the prescribed words or figures, denoting that the design is registered; and if he fails to do so the proprietor shall not be entitled to recover any penalty or damages in respect of any infringement of his copyright in the design unless he shows that he took all proper steps to ensure the marking of the article, or unless he shows that the infringement took place after the person guilty thereof knew or had received notice of the existence of the copyright in the design.

(2.) Where a representation is made to the Board of Trade by or on behalf of any trade or industry that in the interests of the trade or industry it is expedient to dispense with or modify as regards any class or description of articles any of the requirements of this section as to marking, the Board may, if they think fit, by rule under this Act, dispense with or modify such requirements as regards any such class or description of articles to such extent and subject to such conditions as they think fit.

55.—The disclosure of a design by the proprietor to any other person, in such circumstances as would make it contrary to good faith for that other person to use or publish the design, and the disclosure of a design in breach of good faith by any person other than the proprietor of the design, and the acceptance of a first and confidential order for goods bearing a new or original textile design intended for registration, shall not be deemed to be a publication of the design sufficient to invalidate the copyright thereof if registration thereof is obtained subsequently to the disclosure or acceptance.

56.—(1.) During the existence of copyright in a design, or such shorter period not being less than two years from the registration of the design as may be prescribed, the design shall not be open to inspection except by the proprietor or a person authorised in writing by him, or a person authorised by the comptroller or by the court, and furnishing such information as may enable the comptroller to identify the design, and shall not be open to the inspection of any person except in the presence of the comptroller, or of an officer acting under him, and on payment of the prescribed fee; and the person making the inspection shall not be entitled to take any copy of the design, or of any part thereof:

Provided that where registration of a design is refused on the ground of identity with a design already registered, the applicant for registration shall be entitled to inspect the design so registered.

(2.) After the expiration of the copyright in a design, or such shorter period as aforesaid, the design shall be open to inspection, and copies thereof may be taken by any person on payment of the prescribed fee.

(3.) Different periods may be prescribed under this section for different classes of goods.

57.—On the request of any person furnishing such information as may enable the comptroller to identify the design, and on payment of the prescribed fee, the comptroller shall inform such person whether the registration still exists in respect of the design, and if so, in respect of what classes of goods, and shall state the date of registration, and the name and address of the registered proprietor.

58.—(1.) At any time after the registration of a design any person may apply to the comptroller for the cancellation of the registration on the ground that the design is used for manufacture exclusively or mainly outside the United Kingdom, and where such an application is made the provisions of this Act with respect to the revocation of patents worked outside the United Kingdom (including those relating to costs) shall apply with the necessary modifications, except that there shall be no appeal from the decision of the comptroller.

(2.) Such ground as aforesaid shall be available by way of a defence to an action for infringement of the copyright in the design.

Industrial and International Exhibitions.

59.—(1.) The exhibition at an industrial or international exhibition certified as such by the Board of Trade, or the exhibition elsewhere during the period of the holding of the exhibition, without the privity or consent of the proprietor, of a design, or of any article to which a design is applied, or the publication, during the holding of any such exhibition, of a description of a design, shall not prevent the design from being registered, or invalidate the registration thereof; Provided that—

(*a*) The exhibitor, before exhibiting the design or article, or publishing a description of the design, gives the comptroller the prescribed notice of his intention to do so; and

(*b*) The application for registration is made before or within six months from the date of the opening of the exhibition.

(2.) His Majesty may, by Order in Council, apply this section to any exhibition mentioned in the Order in like manner as if it were an industrial or international exhibition certified as such by the Board of Trade, and any such Order may provide that the exhibitor shall be relieved from the condition of giving notice to the comptroller of his intention to exhibit, and shall be so relieved either absolutely or upon such terms and conditions as may be stated in the Order.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in or connected with the production of Fertilisers, Filtering Materials, and the like. J. Brightmore, Mayfield House, Tideswell. British Patent, 15,922. July 13, 1906.

This invention relates to a process for the production of fertilisers from compounds of lime, lime-kiln refuse, or the like, and consisting in reducing the materials to a suitable state of division, moistening with water, subjecting the moistened mass to the action of an electric current and heat, then to the action of superheated steam, and finally exposing the mass to gases or fluids containing nitrogen. The block or mass may also be used in filter beds or otherwise employed for filtering sewage or the like, in which case it may be utilised without previous impregnation with gas or fluids containing nitrogen.

Improvements in and relating to the Extraction of Tin from Ore or Oxide, and in Apparatus for use therewith R. W. E. MacIvor Glengall-road, London, E., and M. Fradd, Finsbury House, Blomfield-street, London. British Patent, 22,162. October 8, 1906.

This invention has special reference to the use of producer or water gas in connection with the extraction and reduction of tin from ore or oxide. In the inventors' previous specification, No. 10,943, of 1905, they described a process in which finely divided tin ore heated to a suitable temperature in a closed furnace is subjected to the continuous action of producer or water gas, while particles of the ore are agitated during the process of reduction, and thereby exposed to the full action of the gas or mixture of gases. With this previous process it was not contemplated to draw and recharge the reduction chamber while hot, which is one of the objects of this invention.

When it is desired to draw and recharge the reduction chamber while hot, the gaseous contents must be first expelled, which is effected preferably by the introduction of superheated steam, or by introducing a stream or current of any inert gas which will not oxidise or otherwise prejudicially affect the molten tin, if not drawn off so that the reduction chamber can be drawn and recharged while hot, thereby saving both time in working and fuel, and enabling the work to be continuous. The invention also comprises an arrangement of furnace specially adapted for carrying out the method of reducing tin from ore or oxide by the use of producer or water gas.

In carrying the invention into practice, finely divided ore or oxide is brought to a red heat in a closed chamber provided with any suitable means for agitating the contents during the process of reduction. A suitable form of chamber for this purpose is preferably of a cylindrical type, arranged to be slowly rotated, and may be heated either externally or internally, or the two methods of heating may be used together. The interior of the chamber is fitted with longitudinal projecting ledges or other known means, to carry portions of the charge half round, when it will fall from the top to the bottom of the reducing chamber, and in this way the particles of the charge will be exposed to the continuous stream of gas passing through the reducing chamber. It is preferred that there shall be a continuous flow of gas through the reducing chamber. The gas supply is derived from any usual form of water-gas producer.

Method of Manufacture of Sulphide of Zinc. J. C. A. Meyer, 208, Avenue Félix Faure, Lyons. British Patent, 5,032. March 1, 1907.

The inventor claims:—The method of manufacturing pure zinc sulphide, by precipitating the same by means of sulphuretted hydrogen from a solution of zinc acetate obtained by treating with sulphuretted hydrogen an acetic solution of mineral zinc which contains lead in the proportion of not less than 2% of the amount of zinc present, or to which sulphuric acid has been added, so that the iron is eliminated from the liquor by the action of the lead, together with salts of copper, cadmium, tin, lead, and other metals forming dark-coloured sulphides.

Improvements in Electrodes for Resistance Furnaces. H. Röchling, Schoenawa, and J. Rodenhauser, all of Völklingen-on-Saar, Germany. British Patent, 11,917. May 22, 1907.

The claims of this specification are:—(1.) Improvements in electrodes for resistance furnaces in which the heat serving for liquefying the material to be smelted is produced by the conducting resistance of the material to be smelted itself, which consist in the electrode, which is let into the furnace wall consistng of two parts, one a slab, standing in direct contact with the metal bath, and made of alkaline earths and the so-called rare earths or their chemical compounds and a carbonaceous adhesive, of preferably large section and slight thickness, and a plate, embedded between the material of this slab and that of the furnace wall, and formed of metal which is only fusible with difficulty, of somewhat similar superficial area to the slab, the face of which, which faces the slab, being adapted to be provided with suitably profiled channels for enlarging the current transfer surface and facilitating the firm attachment of the slab. (2.) In electrodes for resistance furnaces, the arrangement of the terminal in the furnace wall, which consists in the terminal embedded when the furnace is erected between the material of the furnace wall and the electrode slab being separated from the material of the furnace wall which material becomes a conductor at a high temperature by the interpolation of a fire resistant electrically insulating layer.

Market Reports.

THE AMERICAN CHEMICAL MARKET.

NEW YORK, November 12th, 1907.

(Rate of Exchange, $4.87 = £1.)

Nitrate of soda remains rather slow and weak at $2.35. to $2.40., as to delivery. Sulphate of ammonia is quoted at $3.07½., without much inquiry. Grey muriate for galvanising is in slow demand, owing to the small business being done by the iron trade, but prices remain steady at previous quotations. White muriate, for electrical purposes, is weak at 5½c. to 6c. per lb., as to make. Lump sal ammoniac is unchanged at 9½c. per lb. Lump carbonate of ammonia inclines downwards for next year's contracts, owing to keener competition. Bleaching powders are slow, at $1.15. to $1.25. per 100 lbs., the higher range being for English. Alkali, light 58%, in bags, is 90c. to 92c. per 100lb., f.o.r. makers' works, while caustic soda, 74%, is $2.10. per 100 lbs. Sulphate of copper remains unchanged at 5½c. per lb. White powdered arsenic is very dull at 6⅞c. to 7c. per lb., as to quantity and delivery. Red Saxony arsenic is steady at 7½c. per lb. Calcined carbonate of potash, 80-85%, is rather firm at 3⅞c., and hydrated is 4⅛c. to 4¼c. per lb. Caustic potash, 75%, is 4⅛c. Chlorates of potash and soda are more firmly held, at the Syndicate quotations previously reported, at which contracts for next year have been booked. Bichromate of potash is 8⅜c., and soda 7⅛c. per lb., nominally, although the re-sellers are shading these figures. Prussiate of soda is 9½c. per lb. for spot, and is firmer for next year, at the same price. Prussiate of potash is steady, at 15½c. per lb. for prompt. Phosphate of soda is unchanged at 1¾c. to 2c. per lb. Antimony salts, 47%, are 13c. to 14c. per lb., while antimony oxide is quoted from 10c. to 11c. per lb. Tartar emetic is unchanged, at 23c. per lb. Oxalic acid is in more plentiful supply, and sells at 7½c. to 7⅝c. per lb.

THE RUSSIAN CHEMICAL MARKETS.

The St. Petersburg chemical report of November 14 states that the wave of depression which began in the Autumn on the Western European markets has gradually made its way over Russia. During the fortnight preceding the date of the report this has been particularly observable in sulphate of copper, which, in sympathy with the tremendous fall in the metal, has cheapened by almost a rouble (2s.) per pood. Besides this, zinc white, sal ammoniac, alum, Chili saltpetre, etc., have lost value. Last quotations were :—Nitric acid, 36° B., 3 roubles to 3r. 20 copecks; borax crystals, 4r. 40-80c.; white lead, 5r. 5-15c.; chloride of lime, 1r. 45-60c.; potash alum, 1r. 10-25c. (as compared with 1r. 15-30c.); sulphate of copper, 5r. 50c. to 6r. (as compared with 6r. 50c.); sal ammoniac, 7r. 25-50c. (as compared with 7r. 50-80c.); Chili saltpetre, 1r. 90c. to 2r.; caustic soda, 2r. 65c.; superphosphates, 16-17%, 65c. to 70c.; sulphur (lump), 1r. to 1r. 5c., and flowers, 1r. 55c. to 1r. 60c.; sulphuric acid, 66° B., 85-95c.; tannin, 22r.-23r.; bichromate of potash, 8r. 40-60c.; bichromate of soda, 7r. 25-35c.; ether (0.725), 8r. 50c. to 9r. 50c.; collodion (4%) 13r. 50c. to 14r. 50c.—all per pood of 36 lbs.

The Riga report of November 17 states that the tone of the market was brisk; prices were firm, and stocks limited. There was a particularly good demand for naphthaline and disinfectants. The latest prices for the principal items were :—Sulphuric acid, technical, 66° B., 1r. to 1r. 5c.; nitric acid, 40° B., technical, 3r. 80c. to 4r. 10c.; muriatic acid, 20° B., 90c.; Glauber's salts, 75-80c.; sulphate of magnesia, 95c.; barium chloride, 2r. 90c.; potash, alum (in crystals) 1r. 10-20c.; chloride of zinc, 2r. 5c.; naphthaline, 2r. 75c.; sulphate of soda, 1r. 75c.; soda (small crystals, best quality) 80c. to 1r.; bicarbonate of soda, 2r. 20-30c.—all per pood. The Odessa chemical market (November 14) was reported firm, but the business done was limited. Prices quoted are :—White lead, 6r. to 6r. 10c.; glycerine, 11r. 75c.; wood spirit, 96°, 7r. 50c. to 75c.; chloride of lime, 1r. 90c. to 2r.; yellow prussiate of potash 14r. 25-75c.; salammoniac, 8r. to 8r. 5c.; Caucasian potash, 2r. 50c.; Chili saltpetre, 2r. 5-10c.; caustic soda, 2r. 75c.; calcined soda, 1r. 40-45c.; hydrochloric acid, technical, 1r. 5c.; citric acid, 41r.—41r. 50c.; Odessa tartaric acid, 23r. 25-50c.; Russian turpentine, 3r. 20c.; sulphuric acid, 66° B., 1r. 25c.; acetic acid, 80°, 8r. 25-75c.; bicarbonate of potash, 9r.; ether, 8r. 25-50c.—all per pood.

TAR AND AMMONIA PRODUCTS.

FRIDAY.

Benzols: 90's steady at 8¾d. to 9d.; 50-90's quiet, at 8½d. to 8¾d., casks included. Crude tar, 14s. 6d. to 18s. 6d. per ton, Thames; 1½d. to 1⅝d. per gallon, delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 23s. 6d. to 24s., f.o.b.; Gas Company, 26s.; East Coast, 22s. 6d. to 23s.; West Coast, 22s. to 22s. 6d., f.a.s. Refined naphthalene, £6. 10s. to £8. 10s., packages included. Toluol, 90%, 9½d. to 10d.; pure, 1s. d., casks included. Carbolic acid, crude, 50%, 1s. 5d. to 1s. 5½d.; 60%, 1s. 7¾d. to 1s. 8d.; 75%, 1s. 11¾d., casks included. Crystals, 39-40, 5d.; 34-35, 5d. to 5⅛d. Cresylic, 95%, 1s. 0½d. to 1s. 1d. Anthracene, 40 to 45% A, 1½d. to 1¾d., casks included. Pyridin, 4s. to 4s. 3d.

Sulphate of ammonia quiet. Nearest values are :—Beckton, this year, £12. 5s.; next year, £12. 7s. 6d.; Beckton terms, £11. 17s. 6d. to £12.; London, £11. 17s. 6d.; Hull, £12.; Liverpool, £12.; Manchester, £11. 17s. 6d.; Leith, this year, £12. 5s.; next year, £12. 7s. 6d.

Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 9d.; Liverpool, ordinary, 11s., and refined, 11s. 1½d. Official quotations :—Cargoes, off coast or due, 11s.; ditto for prompt shipment, 11s. 3d.

THE LONDON METAL MARKETS.

WEDNESDAY.

Copper: Standard brands, £62. 17s. 6d. to £63. 2s. 6d. cash, and for three months £63. 2s. 6d. to £63. 7s. 6d. Tin: G.M. quality, £137. to £137. 10s. cash, and £138. 10s. to £139. three months; English, £140.; Banca, 84¼fl. Lead: Soft foreign, prompt, £16. 15s.; December, £16. 10s.; January, £16. 10s.; February, £16. 10s. Spelter: Ordinary brands, December, £21. 5s.; January, £21.; February, £20. 15s., ex ship; hard, £18., f.o.b. Antimony, £32. to £35.; crude, £20. to £23., c.i.f.; ore, £9. to £9. 10s. Bismuth, 6s. 6d. Quicksilver, £8. 5s.; seconds, £8. 3s. 9d. Nickel, 1s. 1od. per lb. Aluminium, £100. Wolfram, 35s. Pig-iron closing prices :—Cleveland, 50s. cash; 49s. 6d. one month; 48s. 9d. three months; settlement price, 50s. 3d.

FERTILISER MATERIALS.

THURSDAY.

We have again to report a quiet market, both for ammoniacal and phosphatic material, though in some instances the tone is distinctly firmer, especially in the forward position.

There is no new business to record in mineral phosphates, the nearest values being 9d. per unit for Floridian and 6¾d. per unit for Tunisian, c.i.f. good U.K. port.

The market for East Indian bone meal has advanced, and for shipment business has been done at £5. per ton, nett cash, c.i.f. Liverpool; spot quotations are £5. 5s. to £5. 10s. per ton, ex store, according to quality.

The position of nitrate of soda has improved, and for forward delivery an advance of 3d. per cwt. is required. Spot values are still 11s. per cwt. for ordinary 95% quality, and 11s. 1½d. per cwt. for refined, ex store, Liverpool.

MISCELLANEOUS CHEMICAL MARKET.

THURSDAY.

There are no changes of any material kind during the week, and business generally is reported quiet. Values, however, are well maintained and the tendency upon the whole is rather in the direction of higher prices. In the alkali and heavy chemical trades costs are higher by reason of dearer fuel and raw materials. Ammonia alkali, 58%, stands at £4. 10s., bags, f.o.r. Caustic soda, 70%, £10. 2s. 6d. per ton, f.o.r. Bleaching powder, £4. 5s. to £4. 7s. 6d., f.o.b. Soda crystals, 55s. per ton, f.o.r. in bags. Sulphate of copper is dearer at £23. per ton, f.o.b. In vitriol and muriatic acid a fair amount of business has been concluded for next year at advanced prices. Saltcake is selling freely at 42s. 6d. per ton in bulk, both for prompt and forward delivery. Acetates of lime are rather lower in price. Acetic acids unchanged. White powdered arsenic is steady, at £27. 10s. to £28. Prussiates, 3⅜d. to 5⅞d. per lb. are current quotations for prompt and future delivery. Chlorates are 3½d. and usual convention terms. Demand still active for green copperas. Muriate of ammonia firm, at £24. 10s. Other ammonia salts keep steady. Alum and sulphate of alumina rather dearer.

Digitized by Google

LIVERPOOL DRYSALTERIES.

WEDNESDAY.

There is little demand for Montreal potashes, with only a small quantity on the market, which is offered at 36s. 9d. to 37s. per cwt. Pearl nominal, owing to absence of supplies. Logwood firm, but with few sales reported. Cutch: Prices maintained, but little doing. Gum steady, with quiet demand for Arabic. Castor oil quiet, but the market is firm, with quotations at 3 7/16d. for first pressure, 3½d. for second pressure French, 3 5/16d. to 3⅜d. for good seconds Calcutta, and 3¾d. per lb. for first pressure French; forward parcels of Calcutta are quoted at 3⅜d. for November-December, and 3¾d. for January-April shipments. Gambier still quiet; ruling prices are: 23s. to 23s. 6d. for block, on spot; 20s. 3d. for November; 19s. 6d. for November-December; and 19s. per cwt. for December-January shipment; cubes, 28s. 9d. to 29s. ex quay, and store parcels, 30s.; November shipments, 28s., and November-December shipments, 27s. 10½d. per cwt. Shellac firm but inactive, with quotations given at 107s. 6d. to 110s. for fair TN orange in block parcel, fair free selling at 120s. to 125s., and December-February shipment, 113s., c.i.f.; December delivery, 112s.; January, 113s., and March 115s. Glucose quiet: American liquid, 43%, on spot, 11s. 9d., January-March delivery, 11s. 3d., and January-March shipment 9s., c.i.f., "Union Jack." Crystal, January-March delivery, 11s. 3d. ex works, London; chips, 80%, for shipment, quoted at 9s., and 70% 9s., c.i.f. American powdered starch, 11s. on spot, and for shipment, 10s. 6d., c.i.f. Cream of tartar, 98%, foreign powder, 88s. to 89s.; 95%, 86s. to 87s. Tartaric acid: English, on spot, 11½d.; foreign, 11d. Citric acid: English, 1s. 8½d.; foreign, 1s. 8½d.

LIVERPOOL OIL MARKET.

WEDNESDAY.

OILS.—Palm oil dull, sales including Accra on spot at £26. 7s. 6d.; Lagos, for early arrival, £28. 5s.; hard oils, on spot, £26. Saltpond, for early arrival, £25. 10s., and December-January delivery, £25. 2s. 6d. per ton, all in transit. Linseed oil steady at 24s. 9d. to 25s. 6d. per cwt., for Liverpool makes in export casks. Cottonseed oil quiet, with values given at 24s. 9d. to 25s. 9d. per cwt., for Liverpool makes in export barrels. Turpentine quietly steady, with quotations for spot parcels at 36s. 3d. per cwt. Petroleum in fair demand, and prices firm at 7d. for Russian and Roumanian, and 7½d. to 8½d. per gallon for American refined oils. Petroleum spirit steady and in fair inquiry at 1s. 0½d. to 1s. 3d. per gallon for spot parcels of American.

HULL PAINT, OIL, AND COLOUR REPORT.

WEDNESDAY.

OILS.—Although there have been slight changes during the week, values of seed oils close practically in the same positions. Turpentine has lost value by 30s. per ton. Amongst the principal imports here during the week are:—Linseed, 22,207 qrs.; ravison seed, 1,020 qrs.; rapeseed, 635 qrs.; cottonseed, 6,582 tons; margarine, 2,817 cwts.; lard, 5,033 cwts.; sugar, 28,278 cwts.; hemp, 2,290 cwts.; pig iron, 2,682 tons; oilcake, 179 tons; colours, 1,991 pkgs.; wool, 106,266 lbs.; hides, 43 cwts. Exports:—Oil, 10,016 cwts.; colours, 2,019 pkgs.; chemicals, 2,264 pkgs. Cottonseed: Fair business passing, but at lower rates; spot, £6. 15s.; on passage, £6. 15s.; November, £6. 15s. for 2,000 tons: December sold at £6. 16s. 3d.; December-January, 100 tons a month sold at £6. 17s. 6d.; Bombay, November-December quoted £5. 16s. 3d.; total imports since 1st January, 312,959 tons, against 251,259 tons last year. Refined cotton oil, spot, 21s. 6d.; sellers, December-January 21s. 7½d.; crude ditto, spot and to April, 20s. 6d.; casks £1., and barrels £1. 7s. 6d. per ton extra. Amongst the exports are: 119 tons to Marseilles, making a total of 602 tons, against 778 tons same week last year. Linseed: The total imports for the year have been 755,959 qrs., against 533,229 qrs. same time last year; La Plata, spot, is quoted 43s.; November-December 42s. 3d.; December-January, 40s. 1½d.; buyers, January-April 39s. 9d.; February-March, 39s. 6d. Linseed oil, naked, spot, 22s. 3d.; December, 21s. 9d.; January-April, 20s. 10½d.; boiled and refined, £1. to £1. 10s. per ton extra. Amongst the exports during the week are:—109 tons to Melbourne, 151 tons Sydney, making a total of 314 tons, against 19 tons same week last year. Rapeseed firm, but oil cheaper by 15s. per ton. Olive oil, Levant, from £41. to £43. per tun. Turpentine quiet; spot, 36s. 3d.; December, 36s. 6d.; January-April, 37s. 3d.; Russian ditto, 19s. 6d. Castor oil easy; November-December, 30s. 3d. for firsts, to 29s. 5d. July-December; seconds, £1. per ton lower. Rosin from 10s. 3d.

CAKES.—Linseed cakes, 95% pure, £7. 15s. to £8. Russian, £7. 15s.; Canadian, £8. Oilcakes, £6. 15s. Cotton cakes firm, £5. 2s. 6d.; Bombay, £4. 7s. 6d. Rape meal, £5. 5s. Manure meal, £4. 5s.

TYNE CHEMICAL REPORT.

WEDNESDAY.

Market here is quiet, but steady. Soda crystals, locally, are quoted at £3. to £3. 2s. 6d. per ton, gross weights, for prompt. Caustic soda, 70%, £10. 5s., and 76-77%, £11. per ton. Bleaching powder steady at £5. to £5. 5s. per ton. Sulphur scarce and firm, at £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, WEDNESDAY.

Sulphate of ammonia, prompt, f.o.b. Leith and Glasgow, continues on a quiet market at about the figure of a week ago. With regard to forward transactions there is still no business reported, neither side being at all anxious in the meantime to close. The price nominally given by makers ranges from £12. 5s. to £12 7s. 6d. The calico printers and cotton dyers are still rather badly situated, but the temporary arrangement with regard to the Lancashire cotton dispute, if confirmed, will probably ease matters a little by making supplies of cloth less uncertain for a time. Stocks of creosote having become short, prices have become very firm, and on Glasgow market values have been substantially advanced. The heavy chemicals, at prices as before, are steady, and in fair call both for spot and deferred.

Chief prices current are:—Alum (in lump), £5. 5s. to £6. 5s., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¾d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 15s. to £5., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3¾d., nett, Glasgow; creosote (ordinary coal-tar and blast furnace), 2¾d. to 3d., naked, f.a.s. Glasgow; nitrate of soda 11s. 1½d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2⅜d. to 2½d. per lb.; paraffin wax, 120°, semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¾d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating) 865°, £6. to £6. 5s.; 885°, £6. 15s. to £7.; 890-895°, £7. 10s. to £8.; prussiate of potash, 5¾d. to 6d., nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £2. 17s. 6d. to £3.; sulphate of ammonia, £12. 5s., prompt, f.o.b. Leith; sulphate of copper, £22. to £23., less 5% Liverpool, prompt.

LATE ADVERTISEMENTS.

SALE BY AUCTION.

BY ORDER OF THE RECEIVER.

SWANSEA CHEMICAL WORKS, LLANSAMLET.

MR. W. J. REES will offer for Sale by Auction, at the Hotel Metropole, Swansea, on Tuesday, 17th December, 1907, the above Important Industrial Undertaking, together with the Buildings, Fixed Plant and Machinery, comprising: Two Glover Towers, Nitric Tower, Gay Lussac Tower, Two Large Chambers, Zinc Blende Crushing Plant and Furnace, Pyrites Smalls Furnace, Seven Railway Acid Tank Wagons, etc. The Works are provided with convenient railway sidings. The area comprised in the taking is about 10 Acres, and held for a term of 99 years from 29th September, 1811, at a ground rent of £105 per annum.

Particulars, with Plan and conditions of Sale, will be obtainable of F. H. Edwards, Esq., Solicitor, 20, Fisher-street, Swansea, S. H. Buckland, Esq., Receiver and Liquidator, Goat-street, Swansea, and of the Auctioneer, The Laurels, Swansea.

CHEMICAL Works Book-keeper, thoroughly capable, reliable, shortly at liberty, could improve business; Manchester district.—Address, "1,027," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

A FIRM in China wishes to have an Estimate for a Cement Plant for a yearly production of 100,000 tons and 200,000 tons of cement. Rotary kilns system. Raw material used, hard limestone and soft clay. Estimates must include every detail with the exception of the cost of raw materials (clay and lime). Fuel and wages to be calculated on the English standard. Offers to be sent to Dr. Livio Silva, Mining Institute and Analytical Laboratory, 80, Broadway, Shanghai.

MICROSCOPE Wanted.—Full particulars and lowest price to "1,628," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

DRONSFIELD, near Sheffield.—*Re* The Sheffield Animal Bye-Products Co., Ltd. These up-to-date Freehold Works, lately occupied by the above company and the Dronsfield Bone Works Co., Ltd., for Sale (only recently stopped working), or Lease, with Plant, Loose Tools, etc.—Particulars from J. W. Naylor, Incorporated Accountant, 4, York-street, Sheffield, Liquidator.

Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To Be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

30 Words and under ..... 2s. 6d. per insertion.
Each additional 6 words ..... 0s. 6d. ,,

Advertisements of Situations Wanted are inserted at the following rates when cash is sent with order:—

24 Words and under ..... 1s. 0d. per insertion.
Each additional 6 words ..... 0s. 3d. ,,

Advertisements intended for insertion in the current week's issue should reach the office by **Thursday morning** at the latest.

CANALS AND WATERWAYS.

A VERY interesting contribution to the discussion of the problem of inland water transport was made by Sir John Turney at a meeting of the Nottingham Section of the Society of Chemical Industry on Wednesday week, in the form of a paper on "Canals and Waterways." The subject was introduced by an account of the conflicting interests that stood in the way of traders from the twelfth century onwards. "The land owners in their feudal pride took toll of the traders who were driven by rapids or shallows to use the towing-path." These pretensions were stoutly resisted, especially by the Mayor and Commonalty of Nottingham, so that in the fourteenth century a Royal Proclamation forbade any further levying of fines by landowners on navigation of the Trent. The principle was finally asserted of holding the great rivers of the Kingdom common and open for the passage of boats and ships.

Sir John maintains that as these waterways, like the turnpike roads, have been cleared of the cumbrous toll system, so should the connecting links—the canals—be taken over and set in order by the State. The example of the Continent should be imitated, and an end put to the present state of things. "The Great Western Railway Company holds the key of the east and west traffic by its possession of the Avon Navigation and Kennet and Avon Canals. The L. and N.-W. Railway own nearly all the canals running north from Birmingham, and the Shropshire Union Canal. The N. Staffs. Railway owns the Trent and Mersey Canal. Altogether, railways possess 1,139 miles out of the 3,907 miles of canals in England. . . . The evil is not so much in the waste of these railway-owned waterways, as in the paralysis of the other 2,768 miles which they divide and isolate."

Showing what could be done if the old conditions were restored, the author stated that transport of heavy traffic could be effected on canals for less than one sixth of a penny per ton per mile—a figure that railways cannot touch for cheap transit. "The success of the Weaver, Aire and Calder, and Severn Navigations in England, and of the great inland waterways in France, Germany, and Belgium, shows that the English Trent and its canal connections might, if properly improved, bring the manufacturers of Birmingham and the Potteries, and the coal of South Derbyshire, to the port of Nottingham, with its docks full of sea-going ships."

From evidence given before the Royal Commission on Canals and Waterways, the falling-off of traffic in the canals connecting with the river at Nottingham is seen. In the middle of the last century 40 or 50 barges of coal hourly entered the Trent at Nottingham, or crossed it for Grantham. At Nottingham the Corporation own six miles

Digitized by Google

of river frontage, and wharves on two canals. By the improvement of the Trent the Corporation would be encouraged to use it for fetching raw material for their various municipal enterprises, and for sending off residuals, ammoniacal liquor, pitch, coke, etc.

The firm with which Sir John Turney is connected receive much of their tanning materials by river, and send their pickled skins and leather to Boston and other parts of the United States by the same route. But delays are frequent in summer owing to shoals, locks being badly needed above Newark.

Sir John declares that if any thorough scheme were adopted for the reform of English waterways, Nottingham would be bound to benefit largely, and would be ready to co-operate with the State in making the city an inland port. The Nottingham Chamber of Commerce and Merchants and Traders' Association strongly favour such action, while the Parliamentary Committee of the Corporation is prepared to recommend the support of the city to any reconstruction scheme which is based on a satisfactory system of contribution.

Illustrating what can be accomplished with canals even under great natural difficulties, the case of Dortmund, a town in Westphalia, was instanced. Situated more than 100 miles from a German harbour, and not on a river, it has been virtually made a port by the construction of a canal connecting it with the River Ems. Owing to the scarcity of water, much has to be pumped, and the employment of lifts is necessary; but in spite of these drawbacks the canal will take 800-ton barges, and in eight or nine years the water-borne trade at Dortmund has grown from 200 to 1,700,000 tons. At much less expense Nottingham could be made another Dortmund. "The Nottingham Corporation is now fully alive to the importance of encouraging new and stimulating old industries."

Sir John Turney urges the Government to emulate those of other countries. Between 1880 and 1893 Germany spent nearly £18,000,000. for the improvement of old and construction of new waterways, whose length in 1895 was 6,214 miles. The State owns 88% of Belgian waterways. France, whose Languedoc Canal of 100 locks and 50 aqueducts, joining the Bay of Biscay to the Mediterranean, was made as early as the seventeenth century, is just as progressive in its modern undertakings. Of 7,459 miles of waterways, all except 158 belong to the State. Sir John's action is evidently prompted by patriotism and a desire not to see this country lag behind in the race for commercial supremacy, for he finishes with the words of M. Freycinet, that "navigable waterways and railways are not destined to supplant, but to support, each other."

"GASSING" ACCIDENTS AND HEROISM.

On Thursday week, at the Bradford Road Gasworks of the Manchester Corporation, an interesting ceremony took place, in which William Surry and John Henry Bell, two of the workmen employed at the gasworks, were decorated with medals presented by the Royal Humane Society, for saving life. On July 23 last, Bell and another workman named Prior proceeded in the course of their duty to examine the syphon pipes in connection with the mains in various parts of the gasworks. One of these pipes is in a well about four feet deep; at the bottom of the well is a plug, which the men unscrew just sufficiently to see that the pipe is clear of obstruction. Prior got into the well and took out the plug; finding that the pipe was blocked, he proceeded to remove the solid matter, omitting, however, to take certain customary precautionary measures to protect himself from the outrush of gas after the obstruction had been removed. Consequently, before he had replaced the plug, he was overcome by the gas. Bell, seeing Prior fall, went into the hole to the assistance of his comrade, but was himself overpowered by the fumes. The other man, Surry, jumped into the pit, plugged the hole, and then fell unconscious. Surry and Bell recovered, but Prior succumbed.

In presenting the Royal Humane Society medals and certificates to the two men, the Lord Mayor of Manchester spoke in high terms of their bravery. It was acts such as these, he said, that had given the British race its reputation for courage, and he was glad to think that whenever the necessity arose, these qualities would not be found wanting. Mr. Alderman Gibson, Chairman of the Manchester Gas Committee, said that if it was right to bestow honours on men who had done noble deeds on the field of battle, as doubtless it was, it was not less seemly that men should honour those who did brave acts in the course of their daily work. These men, knowing the risk they ran, deliberately placed their lives in jeopardy to save a fellow-worker from death. The Gas Committee recognised this fine conduct, and then brought it under the notice of the Royal Humane Society, who had sent down their medals and certificates.

We join with the Lord Mayor of Manchester and Alderman Gibson in their admiration of the plucky behaviour of the two men at the Bradford Road Gasworks. Bravery in critical situations—situations which are almost an every-day occurrence in every large industry—has of late been recognised to a larger extent than was formerly the case, as witness the establishment of the Industrial Order of Courage by His Majesty the King in July last. But we must once more emphasise the fact—so frequently pointed out in these columns—that if proper precautions had been taken, the fatal accident at the Manchester Gasworks would not have happened. Whenever such dangerous work has to be undertaken as the clearing of pipes containing noxious gases under pressure, it is absolutely necessary that the men who are detailed for the work should be provided with apparatus that will render them immune from "gassing." The ordinary respirator is of little use under such conditions as those mentioned above; but if a helmet, fitted with the necessary air tubes, had been worn by the man who first entered the well, the work which he was set to do would have been accomplished with perfect safety.

In chemical works the circumstances of the Manchester fatality may be reproduced at almost any time, and we would again emphasise the need for the adoption of adequate measures for the prevention of "gassing," and the provision of the proper appliances, the use of which should be rigidly enforced. These precautions and appliances are now so well known, through repeated description in this journal and by the recommendations of the Inspectors of Factories, that ignorance can hardly be pleaded as an excuse; and when the details of such occurrences—involving the loss of human life—come before us, we are impelled once more to re-echo the question so often asked by the late Dr. Angus Smith:—"How many accidents make a crime?"

CHINESE TRADE IN 1906.

In his report on the trade of China during 1906, Sir Alexander Hosie, Acting Commercial Attaché to H. M. Legation at Pekin, states that the commercial strain

Digitized by Google

of 1905 continued during the past year, and was, furthermore, accentuated by other factors beyond the reach of human foresight or precaution. Imports decreased owing to over-importation in anticipation of a demand that was not realised, and much in consequence remains to be done before healthy trade recommences in Manchuria. Since the Chino-Japanese war of 1894, the peasantry desire to be assured of a lasting peace before investing their money. The establishment of Chinese custom houses on the frontiers of Manchuria, with equal treatment to all and fixed mileage railway rates for goods irrespective of origin—in other words, "the open door,"—should do much to place trade on an equitable basis.

There was, during 1906, a gold increase of £2,727,902. in the gross trade of the United Kingdom with China, as compared to the previous year; the silver values, however, presented quite a different aspect, the silver decline amounting to as much as £1,272,896., while the decrease in exports from China to the United Kingdom, amounting in value to £528,486. in gold, was in silver £851,559. According to the customs returns, there was a net import of gold into China to the value of £632,021., and a net export of silver to the value of £3,044,066. It has been calculated that, during 1906, the commercial area of China lost to the outside world a sum of 1,325,059 taels on the two metals, the silver loss being 3,960,355 taels, as against a silver gain of 10,758,238 taels in 1905. As regards gold, the business of converting imported British sovereigns into gold leaf and exporting them in their new shape, which was at one time considerable, has of late years not been so brisk, as the Japanese gold yen has been found more tractable than the British sovereign.

A summary of those portions of the report relating to chemicals and drysalteries appeared in the *Journal* last week. A special abstract of other sections will be found elsewhere in this issue.

NITRATE OF SODA.

The prevalence of heavy surf on the West Coast last month interfered, as we expected, with shipments, which are reported to have reached only 179,836 tons to Europe, out of 234,000 tons loading on November 1; the margin, even between the former figure and last Saturday's official estimate of 210,000 tons, is a wide one, and the *Magellan* (8,000 tons) and *Cedarbank* (2,800 tons)—cleared from Iquique and Tocopilla respectively on that day—may have been omitted. In any case, the quantity "loading" on December 1 was 208,300 tons, compared with 108,400 tons at the corresponding date last year, and with the numerous steamers chartered the present month's exports should, in the absence of labour troubles, reach a formidable total. The November deliveries having been 36,650 tons (33,000 according to a leading trade circular) the "visible supply" for Europe on December 1 comes out at 627,000 tons, of which 430,140 tons afloat and 197,850 tons at ports, against 652,550, 507,350, and 145,200 tons respectively a year ago. While stocks at Hamburg were 48,000 tons, they reached 57,000 tons in Dunkirk, and 53,000 tons at minor Continental ports, those in the United Kingdom being 18,000 tons, of which no less than 9,000 tons were in Liverpool. Although the statistical position is—apart from prospective heavy shipments—relatively favourable, the improvement noticed in our last issue has been lost, and the nitrate market is again weak. Notwithstanding the re-opening of navigation on the Elbe, and the receipt of only one cargo at Hamburg during the past fortnight, holders there are anxious sellers of spot at 10s. 7½d. per cwt., while prompt shipment has gone back to 8s. 3d. per quintal, f.o.b. Chili. The financial crisis there is still at its height, the latest quotation of the eighteenpenny paper dollar being 8⅝d.

L'Engrais, of Lille, recently much depressed by the weakness of the nitrate market, is evidently correspondingly elated at last week's recovery—alas! already vanished. Our excellent French contemporary, while acknowledging the unfavourable factors stated in our issue of November 16, accordingly once more twits us with what it chooses to term our persistent pessimism and the inaccuracy of our prognostications (*sic*); it likewise darkly hints at interested motives. The unexpected generally happens in nitrate matters, and we have too much respect for the ability of the market manipulators to indulge in forecasts; we merely submit data not generally accessible, leaving our readers to draw their own conclusions. It is perfectly immaterial to us whether nitrate of soda fetches £12. per ton or £9., and our only wish is that neither the chemical trade nor the agriculturist should be imposed upon. Importers, for whom *L'Engrais* is so solicitous, may have paid high prices, but there is at present no proportion between the cost of production and market quotations.

PERUVIAN RUBBER.

AN expedition from the Argentine Republic, under the leadership of an American engineer, has passed through Iquitos, bound by way of the Ucayali River for the Purus, with the idea of making preliminary surveys to decide whether or not it is practicable to construct a railroad, some 75 miles in length, from the rich rubber districts of the Purus to a point on the Ucayali River, to which the regular river launches may ascend even at low river. The object is to divert the immense rubber traffic of that district towards Iquitos. Under present conditions, because of the lack of overland transportation facilities, the rubber must be transported down the Madeira River to Manaos, thus giving Brazil the benefit of export duties on a strictly Peruvian product.

The United States Consul at Iquitos states that the project is backed by a company of British capitalists, with headquarters in Buenos Ayres, and it is expected that the preliminary surveys will require the greater part of a year. If the plan proves feasible, it is said that the company will receive one of the most liberal concessions yet granted by the Peruvian Government. This also seems probable, for the Peruvian Government is said to be lacking in funds sufficient for the proper development of her vast resources of rubber forest across the Andes from Lima, and it is upon the development of these resources that she must depend in a large measure for her future prosperity. This project, if carried out, should do more towards increasing the rubber exports from Iquitos and stimulating trade in general than any one project yet completed or contemplated in the Department of Loreto.

FERTILISERS IN JAPAN.—According to the latest statistics there are twelve fertiliser factories in Japan, in eleven of which steam-driven machinery is used.

POTASH SALTS.—At the general meeting of the German Potash Syndicate, held last week in Magdeburg, the new Günthersthol, Thüringen, and Heldrungen Mines were formally admitted as members, and a provisional arrangement with the Krugershall Company was approved. The proposed increase of the number of the directorate from 8 to 12 was rejected. The outlook for the industry was reported to be favourable, the expansion in the value of deliveries in the ten months to end of October being estimated at 4½ million marks, or £225,000.

THE ROYAL SOCIETY.

THE PROGRESS OF SCIENCE.

At the anniversary banquet of the Royal Society, held in the Whitehall Rooms at the Hotel Metropole on Saturday last, Lord Dunedin, in proposing the toast of "The Royal Society," asked where was science a hundred years ago? No doubt previously great men of science had lived. Archimedes and Newton and others had done something, and had even taken steps which afterwards it had not been found necessary to retract. But as regards the position of science as something that entered into the every-day business of life, where were they in 1808? Watt had just finished his long struggle with the practical application of the steam engine. Electricity as an agent of every-day life did not exist; and there were still years to come before chemistry should stretch out its hand to the astronomer, and by means of photography and the spectrum analysis open out new realms for him to conquer. And now after the mighty changes of this century, after all the discoveries which were before our minds, it seemed that we were only on the threshold of discovery. Indeed, the one impossibility of to-day seemed to be to fix what was truly impossible. It seemed likely that the primordial elements, whether in form or substance, were yet to discover, and that the old dream of the alchemist, long ago rejected by science, the fable of the transmutation of metals, was something not beyond the possibilities of human invention. It seemed to him that there were three objects which the Royal Society was designed to serve. There was, first, the object of research, without which no progress could be made—and here doubtless their function was twofold. The money grants which the Society was enabled to bestow were in some cases so pitifully small that in his own country they might even be considered as outdoor relief. He knew how passing hard it was to extort from a Chancellor of the Exchequer anything except his blessing. But after all he did not know that that mattered, for he did not suppose that the progress of science ever could depend upon State aid. Surely that progress must depend upon that love of knowledge for the sake of knowledge, or of striving for the sake of striving, which was the true mainspring in all sections of every art and science; and, indeed, of every fruit-bearing action of life. Another object of the Society was to bring scientific men into touch with one another. There was a day when the field of art and science and knowledge of every sort was so restricted that it was sometimes possible for one man to master the ambit of all. We must note how in these latter days the sciences were allied. The more the field was widened the more there was borne in upon one the old saying *Ars longa, vita brevis*. It was one of the functions of the Royal Society to bring together men prosecuting research in different fields, and so far as possible to give to each the results of the others' experience. Lastly, he thought one of the functions of the Society was to popularise science. His Lordship concluded by coupling the toast with the name of the President, Lord Rayleigh, who was no mere figure-head President, but a devoted and distinguished man of science.

The President, after responding, proposed the health of the distinguished men of science to whom the medals of the Society had that day been presented. These gentlemen—Professor Michelson, Professor Morley, Professor Wirtinger, Dr. Traquair, Dr. Hobson, and Professor Griffiths—successively responded.

At the anniversary meeting of the Society on Saturday, Lord Rayleigh, the President, in presenting the Society's medals, intimated that the Copley medal was awarded to Professor Albert Abraham Michelson, on the ground of experimental investigations in optics. One of the Royal medals had been awarded, with the approval of His Majesty, to Dr. Ernest William Hobson, F.R.S. During the last twenty years Dr. E. W. Hobson has been distinguished for the fundamental character of his contributions to mathematics and mathematical physics. His Majesty had also approved the award of a Royal medal to Dr. Ramsay H. Traquair, F.R.S. Dr. Traquair was honoured on the ground of his long-continued researches on the fossil fishes of palæozoic strata which have culminated within the past ten years in his discovery of new groups of Silurian and Devonian fishes; and in his complete exposition of the structure of *Drepanaspis Phlyctenaspis* and other remarkable forms. The Davy medal was awarded to Professor Edward Williams Morley. Professor Morley was well known both to chemists and to physicists for his work in the application of optical interferences and other physical phenomena to increase the accuracy of measurement. His determinations of the absolute weights of a litre of hydrogen and of oxygen, and his investigations of the amounts of moisture retained by gases dried by various desiccating agents, were of the very greatest importance for scientific progress. Professor Wilhelm Wirtinger, of Vienna, was the recipient of the Sylvester medal. He was distinguished for the importance and wide scope of his contributions to the general theory of functions. The Hughes medal was awarded to Principal Ernest Howard Griffiths. Principal Griffiths had conferred great benefit on physical science by his series of measurements of fundamental constants, mainly in the domain of thermal and electric energy. The Buchanan medal was awarded to Mr. William Henry Power, C.B., F.R.S. Mr. Power's services to hygienic science and practice had extended over a period of more than thirty years, and had been of the most distinguished kind.

CHINESE METALS AND MINERALS.

In 1903 the nett import of all kinds of copper into China was 5,555 tons, of the value of £336,526.; in 1904 it was 17,323 tons, of the value of £1,254,252; and in 1905 it reached a total of 57,500 tons, worth £4,690,861. In 1906 large quantities of ingots and slabs were re-exported and the net import was only 3,724 tons, valued at £379,263. More than half of this import was unclassed copper; 1,025 tons were made up of bars, rods, sheets, plates and nails; ingots, slabs and ore accounted for 540 tons, and there were 122 tons of wire. Brass and yellow metal also declined in quantity, wire alone showing an aadvance of 14 tons, and being over 21% ahead of the average import of the previous five years.

Tin and sheet lead rose 100%. There was a drop of 22 tons in nickel, and 7 tons in quicksilver. Spelter dropped from 1,932 tons in 1905 to 473 tons in 1906, the decline being due to the restrictions on the output by the provincial mints of copper coins in which it forms the alloy. Most of the imported tin comes from Ko-chin ch'ang mines in Yünnan. The tin arrives in three qualities, the first and second being fairly pure, but the third often containing 20% of lead. The slabs are melted in concave iron pans resting on brick furnaces fed with wood fuel. In the centre of each pan is placed an open upright cylinder, one foot high and one foot in diameter, surrounded with tin dross through which the molten metal filters into the cylinder, and is tossed, skimmed, and ladled into sand moulds, emerging when cooked as refined ingots. The skimmings and dross are treated with charcoal in bellows-furnaces, and the resulting metal refined in the usual way. The final dross is sold and finds its way to Shanghai, where it is treated for the small quantities of tin and iron which it contains. The tin, as it arrives from Yünnan, is worth 96 to 97 dols. a ton, and after refining, about 100 dols. Some of the tin goes to the U.S.A. and Germany. The Chinese export of tin for 1906 was 4,052 tons, against 4,482 tons in 1905, while the import into China was, for the same years, 2,158 and 3,224 tons respectively.

The import of tinned plates rose from 10,395 tons in 1905 to 14,157 tons in 1906, an advance of nearly 128% on the average of the previous five years. This is due to the rapidly increasing number of kerosene oil tank installations at ports in China

Digitized by Google

which can be reached by steamers carrying oil in bulk, and where the oil is tinned for distribution. Three plates, a round cap, five inches of galvanised iron wire for a handle, a small round socket for the latter, and a little chloride of zinc and solder are required to make up a kerosene tin. All except the soldering, done by hand, is manufactured by ingenious labour-saving machinery. The plates are flattened, hemmed, folded, joined, tops and bottoms cut and inserted, handles folded, and tops punched for filing by one machine after another. The empty tins are placed on a scale or balance and the filling tube inserted in the punched orifice in the top; when the necessary amount of oil has run into the tin, the balance falls and automatically closes the tube. So valuable has the tin become (in the United Kingdom, during 1906, the price was from £161. to £215. a ton) that all the punched and refuse plates are shipped to Europe. The old kerosene tins are in great demand by the native tin-smiths and are manufactured into all kinds of household utensils, such as kettles, buckets, etc.

German silver increased from 403 tons in 1905 to 458 tons in 1906, the import exceeding the previous five years' average by 85%. Zinc sheets and plates advanced from 271 to 653 tons, and the value of unclassed metals from £25,742. to £27,758. The following is a comparative statement of the imports of metals:

Articles	Quantity. Average 1901-05.	1905.	1906.	Increase or Decrease in 1906 compared with 1905. Quantity.	Average 1901-05.
	Tons.	Tons	Tons.	Tons.	Per cent.
Copper—					
Bars, rods, sheets plates and utensils	849	1,141	1,025	− 511	+ 46·27

White metal or German silver	347	403	458	+ 55	+ 85·42
Zinc, sheets and plates	...	271	653	+ 382	+ ...

*Including copper blanks for coinage.

Among the minerals (gold and silver excepted) exported from China to foreign countries are antimony, iron, lead, quicksilver (used in Hong-Kong in the manufacture of vermilion), tin and zinc. With the exception of the iron, which comes from Hupei, they are derived from Western and South-Western China, including the provinces of Ssuchuan, Yünnan and Kweichow. Antimony comes from the south-east corner of Ssuchuan, but is also abundant in the provinces of Kweichow and Kwangsi, although as yet practically unworked; lead comes from Yünnan, but is also found in Kweichow; quicksilver from the south-east of Kweichow, where an Anglo-French Company is at work; and tin, as already stated, comes from the famous Kochiu mines in Yünnan. Deposits of tin would also appear to exist in Kwangsi, for 561 cwts. of tin slabs were brought to Wuchow in 1906 under transit from the prefectures of P'ing-lo and Ch'ing-yüan in the east and centre of the province and well away from the trade route from Yünnan, which may be credited with 52 cwts. conveyed under transit pass to Wuchow from Nanning. Zinc is found in Ssuchuan, and possibly in Hunan.

There are antimony smelting works at Wuchang on the opposite bank of the Yangtsze from Hankow, the property of a German firm. As the export of minerals is annually becoming more important, the subjoined table will show the present position of the trade:—

	1905. Quantity.	1905. Value.	1906. Quantity.	1906. Value.
Antimony—	Cwts.	£	Cwts.	£
Regulus & refined	66,000	28,606	75,373	43,928
Ore	46,264	11,932	71,333	20,296
Lead	..	..	105	112
Lead ore	28,321	4,860	48,721	8,972
Quicksilver	332	4,306	362	4,002
Tin, in slabs	89,645	517,666	81,034	530,891
Zinc	803	509	1,445	1,124
Zinc ore	138,453	11,820	151,119	14,914

BORAX IN PERU.

THE working of the borax deposit at Lake Salinas, in Peru, is the subject of some notes in the *Engineering and Mining Journal* (New York). Lake Salinas lies at an altitude of about 14,200 feet, occupying the bottom of a large basin in a markedly volcanic region. The quantity of water discharged into this basin has diminished to such an extent that the so-called lake is now dry for the greater part of the year. The following is a description of a vertical section of the deposit:—A superficial crust of chloride and sulphate of soda, fine sand 10 to 14 cm. thick, gravel 6 cm. thick, sand with layers of borate 20 to 50 cm. thick, shallow fine sand, borate of variable thickness, usually 40 cm. but sometimes reaching a maximum of 1 m. The borax deposit is a calcium sodium-borate, or ulexite; on extraction the percentage of boracic acid is 30, afterward being raised by artificial desiccation to 52. Two kinds of borate are recognised —the *sedoso* (silky), which is fibrous ulexite with a brilliant silky lustre, and the *corriente* or ordinary borate, which generally contains water and other impurities.

The borate bed being impermeable, the parts of the lake containing no borate are easily recognised by the presence of pools of water that do not dry up. The borate is extracted by means of shallow pits 1 m. wide by 2 or 3 m. in length. When all the borate has been taken out, the water rises and fills the pits—they are dug in series, and space is left between them for transport—upon which another is sunk, a narrow wall being left between the two to prevent flooding of the second pit. Decauville transmission lines are used to collect the borate from the point of exploitation to the central station where the drying and sacking take place. Twelve furnaces are used for the former purpose, each one having a daily capacity of 85 quintals and a fuel consumption of 68 quintals of "yaretas."

This "yaretas" is a vegetable peculiar to the elevated regions of the country, its calorific value being derived from the quantity of rosin found in it. It cannot be used more than twenty days after culture, as it then begins to dry and rot; it is found in abundant quantities, its cost, delivered at the furnaces, being 22c. per quintal. Transportation to Arequipa costs 70c. per quintal. The average shipments to that city are about 3,000 quintals a month.

QUININE PRODUCTION IN INDIA.

THE last annual report of the Madras Cinchona Department gives the out-turn of quinine as amounting to 20,448 lbs., the highest on record. The cost per lb. of manufactured quinine was Rs.10.14½. The Government purchased about 50,000 lbs. of Java bark from Amsterdam as an experiment, and the results were satisfactory. There was a saving of about 8 annas per lb. in the cost of the quinine, and if the Madras bark had been as rich, there would have been double the quantity of quinine produced. The quinine issued from the Government factories was 18,548 lbs., and 2,437 lbs. of febrifuge—another record. The balance sheet shows a profit of Rs.134,035. The Government have a large stock of febrifuge, and are anxious to ascertain its commercial value in Europe.

The Bengal cinchona plantation and factory are in Sikkim. An extended area of 141 acres was planted up last year with 374,159 young trees, the greater portion being *Cinchona Ledgeriana*. The amount of bark yielded during the year was 376,025 lbs., and the total bark worked up in the factory amounted to 598,500 lbs. The output of quinine sulphate was 16,065 lbs., but production was retarded owing to erection of new machinery. No cinchonidine sulphate was manufactured during the year, as the demand had ceased. The profit on the year's working was Rs.1,880.

Continental Notes.

A NEW method for the determination of the fat in milk forms the subject of a communication by Dr. H. Timpe to the *Chemiker-Zeitung*, for November 6. The principle is the same as that of Soxhlet's method—that is to say, the specific gravity is taken of an ethereal solution of the fat. In order to prevent the ether forming an emulsion with the milk, Soxhlet added caustic potash, but this had the disadvantage that some of the fat was saponified, and consequently the results were not accurate. Timpe, however, uses sulphuric acid to destroy the casein, and then has no difficulty in shaking out all the fat with ether. He places 100 c.c. of the milk in a separating funnel and adds 50 c.c. of concentrated sulphuric acid. As soon as the casein has been completely dissolved, 50 c.c. of water are added to prevent further action, the liquid is cooled and shaken out with absolute ether, and the specific gravity is taken at 15° C. The percentage of fat can then be obtained directly from a table given in the paper.

In the same issue E. Wedekind describes a simple method for demonstrating the emanation from radium. It consists essentially in decomposing radium-barium carbonate inside a tube, by means of hydrochloric acid, driving the gases evolved into another smaller tube, absorbing the carbon dioxide (and, if necessary, oxygen and nitrogen), and finally examining the minute residue, which consists mostly of emanation. The author also makes some remarks upon the radio-activity of uranyl molybdate.

The issue of November 9 opens with an article by O. N. Witt in celebration of the fortieth anniversary of the foundation of the German Chemical Society. The writer briefly refers to the action of Hofmann in starting the Society, and the services of those who have been most active in carrying it on.

There is also a paper by C. Zenghelis on the metal of an old Egyptian die for coining. In spite of the fact that it must have been made 300 or 400 years B.C., it was found to be very free from impurities, and to contain tin and copper in the proportion of one to three, which is exactly the composition which gives the hardest alloy. From this an idea may be obtained of the great degree of metallurgical skill that had been reached in Egypt at this early date.

The manufacture of fertilisers in American slaughter-houses forms the subject of another communication. Formerly the disposal of the offal was costly and troublesome, but now it is a source of additional income, and no part is wasted. The various products are known as tankage, concentrated tankage, dried blood, raw bones, raw bone meal, steamed bone, steamed bone meal, azotin, and hoof meal. Tankage is the residue that is left after boiling offal and small bones with water to extract the fat. After pressing and drying it contains 7 to 10% ammonia and a large proportion of phosphate. The water from this operation is evaporated down with ferrous sulphate, and yields the "concentrated tankage," which contains 15 to 16% ammonia. Dried blood is made by boiling down the fresh blood until it coagulates, and pressing. The press-cake, which contains 50% water, is then broken up, dried, and ground. If not mixed with other by-products, it contains 16 to 17% ammonia. Azotin is made from boiled cracklings, which are submitted to a high pressure in order to eliminate the fat as far as possible, then dried, and ground. The material loses 30 to 40% of its weight in the process, and several per cent. of ammonia. The large slaughtering establishments do not concern themselves with this article, as a rule, but leave it to the small tallow and fat boilers.

In the same issue, J. v. Ferentzy describes a method for the determination of tartaric acid in the presence of malic and succinic acids, by precipitation with magnesia mixture in a solution in 50% alcohol.

The issue of the *Chemiker-Zeitung* for November 13 contains brief reports of the papers read at the anniversary meeting of the German Chemical Society, to which reference has already been made. Prof. Nernst spoke on the most important advances in general and physical chemistry during the last 40 years; Landolt dealt with inorganic chemistry; Græbe with organic chemistry; and Witt with technical chemistry. The whole list, although it does not profess to be more than a brief summary of recent discoveries, is extremely impressive.

The same issue contains a paper by M. C. Schuyten on the reactions of the halides of mercury with the halogens. Contrary to the general opinion, he finds that iodine acts upon mercuric chloride and partly converts it into the iodide, and that iodine has a similar action on mercuric bromide under certain circumstances; in fact, any one of the halogens—chlorine, bromine, or iodine—may be replaced by another in combination with mercury.

B. Jost points out that radium bromide ought to be kept in bottles closed with glass stoppers, and not rubber corks, else there is danger of losing part of the precious material.

Answers to Correspondents.

We cannot undertake to reply to correspondents through the post. Those of our readers who have addressed queries to us should look in this column for a reply.

S. J. and Co.—Thanks for your letter. We inferred the cause of miscarriage.

B. and T. (L.), Ltd.—We should like to have the blocks and matter within the next fortnight.

S. and Co., Ltd.—We are looking into this matter, and will write you direct in the course of a day or two.

C. C. (Liverpool).—We are greatly obliged by your courtesy in sending us the documents, which we have duly returned.

D. B., Ltd.—We have now obtained verification of the shipment of "Carbonate of Ammonia," and find that the entry is incorrect. You would notice a correction in last week's issue.

SOCIETY OF CHEMICAL INDUSTRY.

SCOTTISH SECTION.

A MEETING of the Section took place on the evening of Friday, November 29, at the Glasgow and West of Scotland Technical College, George-street, Glasgow, Mr. R. T. Thomson, F.R.S.E., presiding. Mr. Harry Dunlop read a paper on "The Testing of Sperm Oil and Spermaceti," in which he detailed the results of a rather comprehensive field of analysis within the department named. A number of samples of sperm oil and spermaceti had been through his hands, the main objects of the research being the detection of adulterants in these samples (chiefly mineral oil and paraffin wax); the viscosity of sperm oil as compared with other oils; the presence of glycerides in sperm oil, and the detection of blubber oil in the same. The samples operated upon included both Southern and Arctic sperm oils, taken from reliable sources, these differentiating into cachelot oils, from head matter and from body matter; Arctic sperm (bottlenose), and Southern sperm. Tables of analysis accompanying the paper showed, for the separate samples treated, results in specific gravity, iodine value, wax alcohols, saponification, free acid, etc. Another table gave the viscosity details (by Redwood's viscometer) of these sperm oils, and also, for comparison, of mineral oil, lard oil, horse oil, tallow oil, whale oil, and others, while a further table dealt with the glycerol and bromides from sperm oil. The paper was of a highly practical nature, and the author received a hearty vote of thanks for his contribution to the records of the Section.

Naphtha Pits on Fire in Galicia.—A report from Boryslav, Galicia, states that two naphtha pits were destroyed by fire there on Tuesday week.

Nitrate Statistics.—The Permanent Nitrate Committee, in their public statistical circular for December, state the shipments of nitrate of soda as follows:—(1.) Total exports to Europe, November, 3,956,400 quintals. (2.) Imports, Europe, November, 72,100 tons. (3.) Deliveries, Europe, November, 36,650 tons. (4.) Visible supply, Europe, 1st December: Stocks and afloat, 627,990 tons.

Amyl Acetate.—The manufacture of amyl acetate in this country has recently attracted some attention. We learn from Messrs. Boake, Roberts and Co. that they have now a large plant engaged exclusively in the preparation of this article. Considerable difficulty was formerly experienced in securing supplies of chemically pure amyl acetate from the Continent, but the article can now be supplied of English manufacture, and of almost chemical purity. We understand that Messrs. Boake, Roberts and Co. have a still larger plant on order, and it will be seen that consumers in this country should have no difficulty in filling their requirements.

Improvements in or relating to the Treatment of Zinc Residues. R. W. E. MacIvor, Glengall Road, Millwall, and M. Fradd, Finsbury House, Blomfield Street, London, E.C. British Patent, 21,440. September 27, 1906.

This invention relates to improvements in the treatment of zinc residues, the object being to extract zinc from zinc furnace distillation residues containing metallic zinc, metallic iron, zinc silicate, zinc oxide, zinc sulphide and also metallic lead, lead-silver and other products, in order to recover the zinc and to enable the other metals to be effectively treated. Various processes have been proposed for treating such residues in order to obtain the zinc therefrom as zinc sulphate, and in the treatment of complex sulphide ores it has been suggested to extract zinc as chloride from certain roasted products by the joint action of certain acidified solutions of mixed chlorides.

In accordance with this invention the solid residues are treated with calcium chloride solution and sulphuric acid; the zinc chloride solution thus formed is separated and zinc oxide is precipitated therefrom in a well-known way by the addition of lime. According to one method of working the invention, sufficient calcium chloride solution is run on to the dumped material or residues, contained in a tank or suitable receptacle, to yield a quantity of chlorine equivalent to the quantity of zinc to be dissolved. The necessary equivalent quantity of sulphuric acid is also added to produce the zinc chloride solution and to precipitate calcium sulphate into the residues in accordance with the equation:—$CaCl_2 + H_2SO_4 + Zn = CaSO_4 + ZnCl_2 + H_2$. The reaction itself generates sufficient heat to warm the solution, but if necessary further heat may be applied. The solution of zinc chloride is now removed from the residuum by decantation, filter-pressing, or other method, and the solution is treated with lime in quantity equivalent to the zinc chloride contained, whereby the zinc is precipitated as oxide, and calcium chloride is formed in solution in a condition suitable for repeated use for the treatment of fresh quantities of residues. It is found that the precipitation of zinc oxide from its chloride solution is rendered efficacious by means of milk of lime or of dry lime, if a suitable amount of the precipitant be added to the zinc chloride, and if the mixture is then passed through a tube mill or other suitable type of gently grinding agitator. By such means any small lumps of precipitate which may have formed by accretion around a core of precipitant are ground or broken up, and the core of precipitant thus rendered available to throw down more precipitate. Moreover, the zinc oxide thus produced is of a more granular nature than usual, and is capable of rapid filtration and washing.

Improvements in or connected with Filter Presses. G. A. Stevens, Hazelmere Paignton. British Patent, 3,650. February 14, 1907.

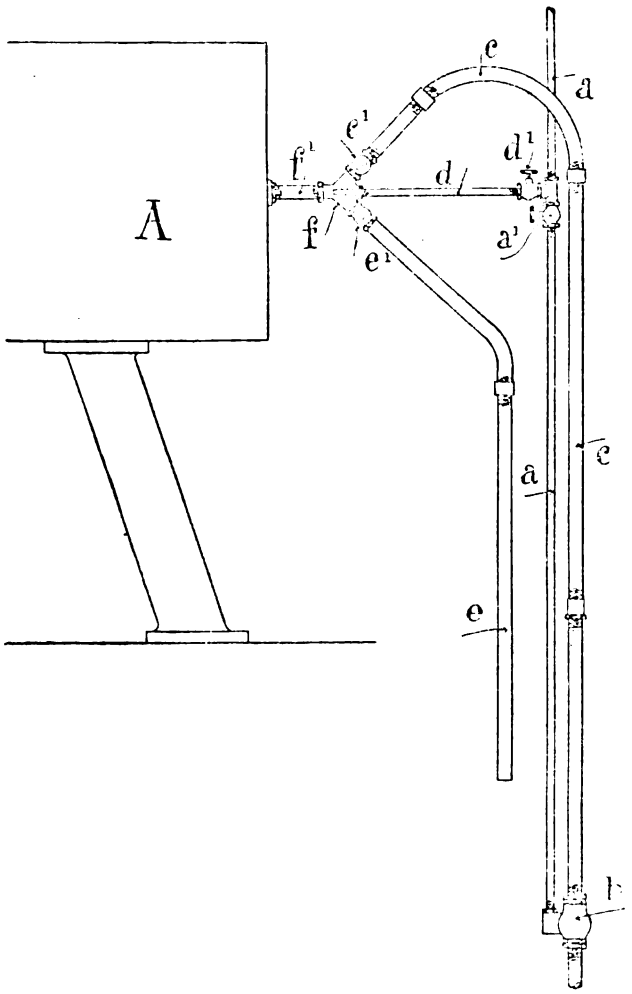
This invention relates to a filter-press filler, or to improvements connected with filter-presses of that class which is used for filtering or separating liquid from solid matter, such as iron oxides, white lead, ochres, china-clay, sewage sludge, and such like. This type of filter-press is usually filled by means of pumps, or by means of an air-compressing plant in connection with the press. According to the present invention the use of pumps (either hand or steam) to effect the filling is dispensed with, and steam is employed to effect the object directly. The steam draws or forces the liquor into the press until a pressure about equal to that of the steam is contained therein, when the steam pressure is turned directly on to the filter-press to complete the pressing and effect the filtration. The full pressure is thus obtained direct on the filter-press, and it is blown through for a suitably short period. Finally a tap is opened to let off the back pressure, and this concludes one cycle.

The illustration shows a form of filter-press filler in accordance with the invention and as applied to a single filter, which is supposed to consist of a number of cast-iron chambers supported and clamped together, and provided with the usual taps for each chamber. In connection with a press of convenient description, such as that marked A, a steam delivery pipe *a* leads from a steam generator or other source of supply, and such pipe *a* is provided with a suitable steam valve a^1 for controlling the fluid, and the steam delivered by this pipe *a* actuates an ejector of any approved description which is located at *b*. This ejector is in communication through a delivery pipe *c* with the filter-press A, and this delivery pipe has a plug tap c^1 located in a suitable positon. Attached to the steam pipe, but in the rear of the controlling valve, is a third pipe or branch *d* which leads to the filter-press, and this pipe or branch is fitted with a steam valve d^1. A fourth or blow-off pipe *e* is connected with the filter press and this blow-off pipe bears a plug tap e^1. The three pipe connections leading to the press may be attached to a main or junction pipe *f*, having three branches to accommodate each of the three connections, and a pipe f^1 leads from the junction *f* to the press as the drawing shows. The filler represented is intended to deal with natural oxide of iron which has been crushed in water, and the liquor is suitably conveyed to the foot of the delivery pipe. The filler may raise and fill a press with other liquor containing solid matter, as described.

In working the appliance, and supposing all valves and taps closed, in order to start, the plug tap c^1 on the delivery pipe *c*, communicating with the filter, is opened, and then the steam

Digitized by Google

valve a^1 on the main steam pipe a. The liquor is then lifted along the delivery pipe c and forced into the press by the ejector, and the press begins to filter, and fills until the pressure in the press A about equals the pressure of the steam. When this occurs and no more liquor can be forced in, the steam begins to bubble back and escape through the liquor at the base of the delivery pipe c. The steam valve a^1 is now closed, and also the



plug tap c^1. To effect the pressing of the material and to complete filtration, the steam valve d^1 on the branch or auxiliary steam pipe d (the nozzle of which projects into the junction branch f) is next opened, and when the valve d^1 is opened steam pressure is thrown directly on the filter, and such steam pressure is kept on the required short space of time, when it is turned off by shutting down the valve d^1. The effect of the steam pressure directly on the filter press is to effect a thorough filtration and to drive out all the liquid, leaving the deposit on the plates, or in the chambers, and the steam is kept on until all the liquid is driven out, when steam will escape. When steam begins to escape, filtration is complete, and the steam valve d^1 can be at once closed. Finally the plug tap c^1 on the other or blow-off branch pipe c is opened to let off any pressure. The usual drainage taps are used in connection with the filter plates in the press A, and, when the filtration is completed, the cake of solid matter is left between the plates and removed as usual.

Improvements in the Manufacture of Tartaric Acid. Sir John McDougall and F. L. McDougall, both of Clifton House, Greenwich Park, Kent. British Patent, 4,613 February 27, 1907.

In the manufacture of tartaric acid the acid is converted into its calcium salt, which is then decomposed by sulphuric acid. The present invention relates to a process whereby this step, with its attendant disadvantages, is avoided. An alkali salt, preferably the potassium salt of the acid, is obtained, and treated with sulphuric acid so as to obtain a solution of alkali sulphate and tartaric acid. To this solution is added a suitable sulphate such as aluminium sulphate, in solid form or as a solution, so as to produce an alum in the solution. The alum is then separated from the tartaric acid by crystallisation. An ammonium salt and double alkali salts are included in the term alkali salt. For instance, in treating lees, sufficient sulphuric acid is added to the raw material to convert the potassium bitartrate into potassium sulphate and tartaric acid, and what calcium tartrate may be present into calcium sulphate and tartaric acid. The liquid, after separation from any solid matter that may be present, is mixed with aluminium sulphate equivalent to the potassium sulphate, that is to say, in the proportion for forming alum, and the solution is concentrated to crystallise the alum, as many crystallisations being effected as may be necessary to free the tartaric acid from alum. From the mother liquor tartaric acid is crystallised, aided, it may be, by addition of sulphuric acid.

THE SIR JOHN CASS INSTITUTE.

THERE was a large attendance at the Sir John Cass Institute, Aldgate, on Tuesday last, when Dr. R. T. Glazebrook, D.Sc., F.R.S., distributed the prizes and certificates gained by students of that institution during the session 1906-07. Sir Owen Roberts presided, and in a short address sketched the progress of the "youngest but not the least successful of the London Polytechnics" since its opening in 1902. He also paid a high tribute to the several distinguished gentlemen who in the past and on the present occasion had given their encouragement to the work of the Institution by distributing the prizes.

Mr. Baker, Chairman of the School and Institute Committee, then read the report for the past session. The number of students had increased from 376 to 718, and an increased number of students had entered for the London University examinations. A fair amount of original work had been carried out, both by students and masters, fourteen pieces of research—seven in physics, five in chemistry, and two in metallurgy—having been completed and published. The results of the London Final B.Sc. examination had not yet been issued, but he hoped that one of their candidates, who sought his degree by research in physics, would be successful. He felt an especial interest in this student, as he believed it was the first time an external student had sat for the Final B.Sc. in the subject named. There had been a steady growth in the number of students attending the metallurgy classes, in fact, so much so that it had been decided to separate the metallurgy from the chemical department.

Before handing the prizes and certificates to the successful students, Dr. Glazebrook said that the increase in the numbers attending the classes worked out at about 12% more than for last session, and this, taken in conjunction with the high standard of the work maintained, was extremely gratifying. The increase in University students was another feature of great promise. In research also the Institution had come out well, and he expressed the hope that with fuller opportunities some of the students might be able to do even a tithe of the good for mankind that was done by Michael Faraday.

Three students were successful in passing the Intermediate Bachelor of Science examination, and fifteen students obtained first-class Science and Art certificates in chemistry and metallurgy.

After the distribution of the prizes there was an interesting exhibition of students' work and apparatus in the laboratories, workshops, and domestic economy rooms.

"E.C." POWDER CO., LTD.—The directors have declared an interim dividend of 1s. per share for the half-year to September 30

LEAD MINING IN DERBYSHIRE.—At the Matlock County Court, on Monday last, a curious Derbyshire mining case came before Judge Leslie, the parties being brothers, Louis and William Pearson. Louis Pearson owns several fields in Salter's Lane, Matlock, and William Pearson started to search on his brother's property for lead ore. This, the Judge said, would be in common law a serious trespass, but under the Derbyshire mining customs, which had been embodied in an Act of Parliament, a man had the right to delve and search for lead ore on somebody else's land. He had not, however, the right to erect a building known as a "coe" in mining phraseology, until he had freed his claim by producing the dish of lead ore required by the barmaster of the Soke and Wapentake of Wirksworth. The defendant had built a "coe" before producing the dish of lead, and the Judge therefore awarded an injunction against him with £10. damages and costs.

Market Reports.

THE AMERICAN CHEMICAL MARKET.

NEW YORK, Nov. 19, 1907.

(Rate of Exchange, $4.86½ = £1.)

The financial difficulties have been reflected to some extent in the chemical markets, but taking everything into consideration prices hold fairly firm, and business is good. Nitrate of soda, on spot, is $2.40., and futures $2.37½. per 100 lbs. Sulphate of ammonia, $3.05. per 100 lbs. Grey muriate, for galvanising, 5⅞c. to 6c. per lb., as to make, and white electrical, 5½c. to 6c. per lb. Lump sal ammoniac is steady at 9¼c. per lb. Lump carbonate of ammonia is 7⅝c. to 8c. per lb., and powdered nominally is 1c. per lb. more. Bleaching powders are quoted $1.15. to $1.25. per 100lb. Alkali, 58% light, in bags, is 90c. per lb., f.o.r. makers' works, and caustic soda, 74%, $2.05. per 100 lbs., same conditions. Sulphate of copper is 5¼c. to 5½c. per lb. White powdered arsenic is slightly cheaper, at 6¼c. to 6¾c. per lb. Red Saxony arsenic is firm at 7½c. per lb. Calcined carbonate of potash is steady at 3⅞c. per lb. for 80-85%, and hydrated is 4¼c. per lb. Caustic potash, 75%, is 4¼c. per lb. Chlorates of potash and soda are respectively 8¼c. and 8½c. per lb., f.o.r. makers' works. Bichromates of potash and soda are unchanged, at 8⅝c. and 7⅛c. per lb., delivered. Phosphate of soda is dull, at $1.80. per 100 lbs. Prussiate of potash is 15c., and soda 9c. per lb. Antimony oxide is 10½c., and antimony salts, 47%, are 12½c. per lb. Oxalic acid is cheaper at 7½c. per lb., owing to larger stocks. Acetic acid is firm at the Syndicate price of 2¾c. per lb.

TAR AND AMMONIA PRODUCTS.

FRIDAY.

Benzols quiet, with quotations given at 8¾d. to 9d., for 90's; 8¼d. to 8½d. for 50-90's, casks included. Crude tar, 14s. 6d. to 18s. 6d. per ton, Thames; 1½d. to 1⅝d. per gallon, delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 23s. 6d. to 24s., f.o.b.; Gas Company, 25s.; East Coast, 22s. to 23s.; West Coast, 21s. 6d. to 22s., f.a.s. Refined naphthalene, £6. 10s. to £8. 10s., packages included. Toluol, 90%, 9½d. to 10d.; pure, 1s. 1d., casks included. Carbolic acid, crude, 50%, 1s. 5¼d. to 1s. 5½d.; 60%, 1s. 8d.; 75%, 1s. 11¾d., casks included. Crystals, 39-40, 5d.; 34-35, 4⅝d. to 5d. Cresylic, 95%, 1s. 0½d. to 1s. 1d. Anthracene, 40 to 45% A, 1½d. to 1¾d., casks included. Pyridin, 4s. to 4s. 3d.

Sulphate of ammonia dull, with very little business passing. Nearest values are:—Beckton, this year, £12. 5s.; next year, £12. 7s. 6d.; Beckton terms, £11. 16s. 3d.; London, £11. 15s.; Hull, £11. 16s. 3d. to £11. 17s. 6d.; Liverpool, £11. 18s. 9d. to £12.; Manchester, £11. 17s. 6d.; Leith, this year, £12. 3s. 9d. to £12. 5s.; next year, £12. 7s. 6d.

Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 9d.; Liverpool, ordinary, 11s. 1½d., and refined, 11s. 3d. Official quotations:—Cargoes, off coast or due, 10s. 10½d.; ditto for prompt shipment, 10s. 11d. nominal.

THE INDIAN CHEMICAL MARKET.

Market movements (Calcutta, November 7) are reported as follows:—Borax: Market weak, and prices have a declining tendency, owing to the influence of increased supplies; rates are Rs.14.12. to Rs.15.4. per bazaar maund weight, loose, for near delivery. Unsold stocks are still light in the market. Saltpetre: Prices steady, owing to a fair amount of buying for Europe for delivery this and next month; sellers are now well sold on the basis of Rs.7.11. to Rs.7.12. for ordinary 5% refraction quality, per factory maund weight, loose. Stocks are light, but supplies are expected on a freer scale. For Furrackabad refined qualities rates are Rs.8.2. to Rs.8.12. per factory maund weight, loose. There has been almost no demand for higher refraction quality. Beeswax: Current prices are still too high to admit of sales for Europe and America. Limited sales are reported for local requirements and for Singapore at Rs.70.0. to Rs.75.0. for refined kinds, and Rs.60.0. to Rs.72.0. for raw, per bazaar maund weight, loose, for near and early deliveries. Stocks are very moderate and supplies are coming in on a small scale. Shellac: The market has collapsed during the past fortnight, the price for T.N. having fallen from Rs.63.0. to Rs.50.0., at which rate some considerable business has been done for December-January delivery. Sellers are weak, and are further depressing prices by offering freely at current rates in face of the absence of orders from Europe and America. Fine shellac and button lac meets with practically no inquiry. Castor oil cake: The market has been dull, but sellers have not reduced their rates, owing to comparatively small stocks and moderate production. Prices are Rs.5.12. for average quality, and Rs.6.2. for picked quality, per bag of 2 maunds, f.o.b., in single gunny for near and early shipments. There has been no demand for export. Bone meal: Quotations remain unchanged at Rs.73.0. for New Zealand quality, and Rs.70.0. for usual standard of steamed quality, guaranteed 4½% ammonia, and 52% tribasic phosphate of lime, per ton of 20 cwts., f.o.b., for near and early shipments. Bone dust, of inferior analysis (say 3½% ammonia and 40% tribasic phosphate of lime) is quoted

Digitized by Google

at Rs.52.0. per ton of 20 cwts., f.o.b., for both steamed and unsteamed qualities. Offerings are moderate. Castor oil: Crushers have lowered their prices, and export business has been done on the basis of Rs.19.8½. for No. 1 fine pale, Rs.13.14½. for good seconds, and Rs.13.8½. for thirds, in cases, per bazaar maund weight, f.o.b. for shipment this month. Offerings of all descriptions are small, especially fine qualities. Cocoanut oil: The market continues very steady, and little has been done for export; rates Rs.20.8½. to Rs.23.0. per bazaar maund weight, f.o.b., for near shipment. Salt: The market continues steady; local stocks held in maund weights were:—Ex Liverpool, 573,013 maunds; Hamburg, 616,877; Aden, 308,901; Saliff, 375,940; Phocee, 128,842; Spanish, 364,004; Bombay, 15,236; and Port Said, 181,000 Quotations per maund were:—Liverpool, Rs.47.0. to Rs.50.0.; Hamburg, Rs.42.0. to Rs.47.0.; Aden, Rs.40.0. to Rs.44.0.; Saliff, Rs.39.0. to Rs.53.0.; Phocee, Rs.41.0. to Rs.43.0.; Spanish, Rs.44.0. to Rs.49.0.; Bombay, Rs.48.0.; and Port Said, Rs.45.0. to Rs.47.0.

FERTILISER MATERIALS.

Thursday.

Quietness still prevails in all markets for manure material, and there is nothing of special interest to report in mineral phosphates.

Owing to a large arrival of East Indian bone meal, shipped to Liverpool unsold, the market is easier on spot. Sellers would accept £5. per ton, ex quay, less 2½% discount. For shipment, however, £5. per ton, nett cash, c.i.f. terms, Liverpool, is still required.

Although there has been a slight advance in nitrate of soda on the Continent, spot prices in Liverpool remain 11s. per cwt. for 95% quality, and 11s. 1½d. per cwt. for refined, ex store, Liverpool, less 2½% discount.

THE LONDON METAL MARKETS.

Wednesday.

Copper: Standard brands, £61. 2s. 6d. to £61. 7s. 6d. cash, and for three months £61. 17s. 6d. to £62. 2s. 6d. Tin: G.M. quality, £133. 5s. to £133. 15s. cash, and £134. 5s. to £134. 15s. three months; English, £135.; Banca, 81¾fl. Lead: Soft foreign, December, £15. 15s.; January, £15. 15s.; February, £16.; March, £15. 15s.; English, £16. to £16. 2s. 6d. Spelter: Ordinary brands, January, £21.; March, £20. 10s. to £20. 12s. 6d. ex ship; hard, £17. 5s. to £17. 10s., f.o.b. Antimony, £32. to £34. 10s.; crude ore, £9. Bismuth, 6s. 6d. Quicksilver, £8. 5s.; seconds, £8. 3s. 9d. Nickel, 1s. 10d. per lb. Aluminium, £100. Wolfram, 30s. Pig-iron closing prices:—Cleveland, 40s. cash; 48s. 10d. one month; 48s. 6d. three months; settlement price, 49s.

LIVERPOOL OIL MARKET.

Wednesday.

OILS.—Palm oil firmer, sales including rough Sherbro', on spot at £25., ex quay; further Niger on spot at £26.; hard oils, for arrival, at £26. 5s.; soft oils, for December delivery, at £27. 2s. 6d. to £27. 5s. Old Calabar, for early arrival, at £27. 5s. to £27. 7s. 6d. Emoe, on spot and for December delivery, £27. 10s., and Lagos, for December delivery, £28. 5s., all in transit. Linseed oil dull, with quotations given at 24s. to 25s. per cwt., for Liverpool makes in export casks. Cottonseed oil quiet, with values given at 24s. 3d. to 25s. 3d. per cwt., for Liverpool makes in export barrels. Turpentine continues steady, with quotations for spot parcels at 36s. 3d. per cwt. Petroleum in fair demand, and still offering at 7d. per gallon for Russian and Roumanian, and 7½d. to 8½d. per gallon for American refined oils. Petroleum spirit in fair inquiry at 1s. 0½d. to 1s. 3d. per gallon for spot parcels of American, and a steady trade is ensuing.

LIVERPOOL DRYSALTERIES.

Wednesday.

Montreal potashes are firm, but only restricted supplies are available, which are offered at 36s. 9d. to 37s. per cwt. Pearl nominal, owing to absence of supplies. Logwood quiet but steady, at recent prices. Cutch: Prices steady, but little doing. Gum firm, and in slight demand. Castor oil quiet, but the market is steady, with quotations at 3 7/16d. for first pressure, 3½d. for second pressure French, 3⅝d. for good seconds Calcutta, and 3¾d. per lb. for first pressure French; no quotations for shipment of forward parcels of Calcutta. Gambier quietly steady; ruling prices are: 23s. to 23s. 6d. for block, on spot; 22s. 6d. for near-at-hand parcels; 20s. 3d. for November; 19s. 6d. for November-December; and 18s. 9d. per cwt. for December-January shipment; cubes, 29s. to 29s. 6d.; November shipments, 28s., and November-December shipments, 27s. 10½d. per cwt. Shellac dull, sales including fair T.N. orange, 120s.; fine to superior at 127s. 6d. to 132s. 6d., and December-February shipment, 108s., c.i.f.; March, 113s., and May, 115s. Glucose quiet: American liquid, 43%, on spot, 11s. 9d., January-March delivery, 11s. 3d., and January-March shipment 9s., c.i.f., "Union Jack." Crystal, January-March delivery, 11s. 3d., ex works, London; chips, 80%, for shipment, quoted at 9s., and 70% 9s., c.i.f. American powdered starch, 11s. on spot, and for shipment, 10s. 6d., c.i.f. Cream of tartar, 98% foreign powder, 88s. to 89s.; 95%, 86s. to 87s. Tartaric acid: English, on spot, 11½d.; foreign, 11d. Citric acid: English, 1s. 8½d.; foreign, 1s. 8½d.

MISCELLANEOUS CHEMICAL MARKET.

Thursday.

The course of business, generally, is quiet and uneventful. In the alkali and heavy chemical trade a normal output and steady demand are maintained, and values all round are firm. Sulphate of copper has undergone some fluctuations in price during the week, and stands at £22. 10s. to £22. 15s., f.o.b., for December and early spring delivery. Alkali, 58%, is firm at £4. 10s., in bags, f.o.r., and caustic soda, 70%, is unchanged at £10. 5s. per ton, f.o.b., for prompt and forward delivery. Soda crystals, 57s. 6d. per ton (in bags) f.o.r. Bleaching powder, £4. 7s. 6d. to £4. 10s., f.o.r. and f.o.b. Chlorates, 3½d. per lb. Saltcake is steady, at 42s. 6d. per ton, in bulk. Glauber salts, 35s. to 37s. 6d. per ton. For sulphur there is fair demand at £4. 17s. 6d. to £5., for recovered; best thirds, c.i.f., £4. 10s. Acetate of lime is rather lower in price for spot delivery. Acetic acids and acetates are steady in price, but demand is somewhat quiet. Prussiates are unchanged, at 3⅝d. and 5⅝d. White powdered arsenic is quoted £27. to £29. per ton, according to brand. Demand for green copperas is active and prices are firm. Potash, caustic and carbonate, are steady in price and well sold for prompt and forward delivery. Ammonia muriate steady, at £24. 10s. Liquid ammonia, 920, £13. per ton. All other ammonia products are firm and in good general demand.

HULL PAINT, OIL, AND COLOUR REPORT.

Wednesday.

OILS.—In face of the competition for money this market all round has suffered, whether in seed, oil, or turpentine; several spasmodic efforts for recovery have been made, but these cannot be maintained, and markets all round close lower. Amongst the principal imports here to date, as against a year ago, are:—Wheat 3,836,433 qrs., against 3,608,154 qrs.; flour 203,731 cwts., against 327,836 cwts.; linseed 762,232 qrs., against 535,059 qrs.; rapeseed 101,209 qrs., against 120,715 qrs.; cottonseed, Egyptian, 168,708 tons, against 147,858 tons; other kinds 151,886 tons, against 111,923 tons; oilcake 24,390 tons, against 30,649 tons; hemp 123,852 cwts., against 147,984 cwts.; olive oil 3,806 tons, against 3,587 tons; tar 14,809 br'ls., against 13,403 br'ls. Amongst the weekly imports are:—Lard, 216 cwts.; margarine, 2,984 cwts.; sugar, 25,589 cwts.; hemp, 5,530 cwts.; hides, 439 cwts.; pig iron, 1,059 tons; colours, 1,683 pkgs.; wool, 92,993 lbs.; oilcake, 759 tons. Exports:—Oil, 10,014 cwts.; colours, 3,016 pkgs.; chemicals, 2,126 pkgs.; Linseed oil closes lower by 15s. per ton; spot, naked, 21s. 9d.; November-December, 21s. 6d.; January-April, 20s. 6d.; boiled and refined, £1. to £1. 10s. per ton extra. Exports for the week:—272 tons Australia, 3 Denmark, 30 Germany, 1 Japan, 6 Norway; total, 312 tons. Refined cotton oil, 10s. per ton lower; 21s. 1½d. spot; December-April, 21s. 3d.; casks £1., and barrels £1. 10s. per ton extra. Exports:—10 tons Austria, 188 Belgium, 4 Denmark, 168 France, 82 Germany, 122 Holland, 4 Italy, 1 Norway, 24 Sweden; total, 603 tons. Linseed prices have raised a good deal during the week, but close at about last week's prices. Cottonseed declined about 2s. 6d., with fair business passing. Turpentine, 36s. 3d., spot. Rosins lower; about 9s. 6d. for lower grade. Russian turpentine, 19s. 3d.

CAKES.—Linseed quiet, but steady. Cotton cakes moving fairly on contracts; new business slow.

Digitized by Google

TYNE CHEMICAL REPORT.

TUESDAY.

Market steady, but prices unchanged. Caustic soda is in steady request, at £10. 5s. per ton for 70%, and £11. per ton for 76-77%. Bleaching powder firm, at £5. to £5. 5s. per ton. Soda crystals quiet, at £3. to £3. 2s. 6d. per ton, gross weights, locally. Sulphur in demand, at £5. to £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—Market is still active, and prices firmly held for prompt. Coke is dull, and in lessened demand. Quotations for current shipment:—Best Northumbrian steam, 15s. to 15s. 6d. per ton; second qualities, 14s. to 14s. 6d. per ton; small steam, 8s. 6d. to 10s. per ton; best gas coals, 15s. to 15s. 6d. per ton; Durham bunker coals, 12s. 6d. to 13s. per ton; coking coals, 12s. to 12s. 6d. per ton; household coals, 16s. to 17s. per ton; foundry coke, 19s. to 20s. per ton.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, THURSDAY.

Although supplies of cotton are more assured for the time being, this does not seem to help the calico printers much, most of them still being on short time; scarcity of orders is really the trouble. The cotton dyers have improved a little, though still not at all in full work. Colour chemicals and drysalteries generally retain the easier feeling prevailing of late, but without any specific breakdown in values. In the ordinary chemicals the feeling is also to the quieter side, more particularly as regards forward business, and prices are the least shade easier. This is also the case with sulphate of ammonia, prompt, f.o.b. Leith, and while one or two of the makers are in a position to hold for £12. 5s., others are offering at something below that. Although the season's whaling was a failure, mineral oils govern the general market, and whale oils are not at all stiffer, say, now, 17s. 6d. to 24s., black to pale.

Chief prices current are:—Alum (in lump), £5. 5s. to £6. 5s., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 15s. to £5., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3¾d., nett, Glasgow; creosote (ordinary coal-tar and blast furnace), 2¾d. to 3d., naked, f.a.s. Glasgow; nitrate of soda 11s. 1½d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2⅜d. to 2½d. per lb.; paraffin wax, 120°, semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 6¾d.; ordinary sorts, 6½d. and 6¼d. (new season's contract prices), at Glasgow and other big centres; ditto (lubricating) 865°, £6. to £6. 5s.; 885°, £6. 15s. to £7.; 890-895°, £7. 10s. to £8.; prussiate of potash, 5¾d. to 6d., nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £2. 17s. 6d. to £3.; sulphate of ammonia, £12. 2s. 6d. to £12. 3s. 9d, prompt, f.o.b. Leith; sulphate of copper, £22. to £23., less 5% Liverpool, prompt.

New Companies.

Atlas Portland Cement Co., Ltd.—Capital £12,000., in £1 shares (7,000 5% preferred and 5,000 deferred). This company has been formed to take over the business of cement and paving manufacturers, carried on at Canal Side, Neath, as the Atlas Portland Cement Co., and to adopt an agreement between J. Williams of the first part, R. Williams, Beatrice A. Williams, and Alice E. Williams of the second part, and T. A. Flynn of the third part. No initial public issue. The first directors are A. H. Davis and A. Williams. The holders of the preferred shares may appoint three directors, and the deferred shares two directors. Qualification, £100.

British Guiana Balata Co., Ltd.—Capital £20,000., in £1. shares (10,000 preference). This company has been formed to acquire and work certain licences for the collection of balata, indiarubber, and like substances in British Guiana or elsewhere, to adopt an agreement with the Cuyuni River Exploration Syndicate, Ltd., and the Georgetown Rubber Syndicate, Ltd., and to carry on the business of planters and cultivators of and dealers in rubber, gutta percha, and gums of all kinds. No initial public issue. The first directors are L. T. Boustead and D. J. L. Anderson. Qualification, £200. Remuneration, £50. each per annum (chairman £75.). Registered office, 30, Mincing-lane, E.C.

H. B. Oil Co., Ltd.—Capital £5,000., in £1. shares. This company has been formed to carry on the business of oil and general merchants, storekeepers, grease manufacturers, refiners and brokers, etc. No initial public issue. The first directors are J. R. Hanson and J. W. Brown (managing directors), with power to appoint one other director. Qualification, £100. Registered office, 2, Exchange Place, Middlesbrough.

Irish Manufactures, Ltd.—Registered in Dublin. Capital £75,000., in £1. shares. This company has been formed to establish and work a paint and varnish factory in Ireland, to establish and develop other manufactures for which a demand exists and which have in times past flourished in Ireland, etc. The subscribers are to appoint the first directors. Qualification, 100 shares. Remuneration, 10% of the profits available for distribution. Registered office, Trinity Chambers, 40, Dame-st., Dublin.

LATE ADVERTISEMENTS.

TENDER.

BRECON GAS COMPANY.

TENDERS are invited for the surplus Tar and Liquor produced at these works, delivered into tank wagons at Brecon Railway Station, for one year, ending December, 1908.

Probable quantity, 120 tons of tar and 250 tons of liquor of varied strength.

The Directors do not bind themselves to accept the highest or any Tender.

Separate sealed Tenders to be delivered, addressed to the Directors of the Company, on or before Wednesday, January 1st, 1908

SALE BY AUCTION.

BY ORDER OF THE RECEIVER.

SWANSEA CHEMICAL WORKS, LLANSAMLET, GLAMORGANSHIRE.

MR. W. J. REES will offer for Sale by Auction, at the Hotel Metropole, Swansea, on Tuesday, 17th December, 1907, the above Important Industrial Undertaking, together with the Buildings, Fixed Plant and Machinery, comprising: Two Glover Towers, Nitric Tower, Gay Lussac Tower, Two Large Chambers, Zinc Blende Crushing Plant and Furnace, Pyrites Smalls Furnace, Seven Railway Acid Tank Wagons, etc. The Works are provided with convenient railway sidings. The area comprised in the taking is about 10 Acres, and held for a term of 99 years from 20th September, 1891, at a ground rent of £167 per annum.

Particulars, with Plan and Conditions of Sale, will be obtainable of F. H Edwards, Esq., Solicitor, 20, Fisher-street, Swansea, S. H. Buckland, Esq., Receiver and Liquidator, Goat-street, Swansea, and of the Auctioneer, The Laurels, Swansea.

REQUIRED by Analytical Chemist, 21, certificated by Finsbury Technical College, post as Assistant, London or provinces; reasonable salary; has £100 at command; strict confidence.—Y. Z., *Chemical Trade Journal* Office, 265, Strand, London, W.C.

CHEMIST, 21, B.Sc. Honours chemistry, desires appointment; thorough theoretical knowledge, good analyst; best testimonials.—Address, W., 123, Antill road, Bow, London

REQUIRED, thoroughly competent Man to manufacture Bisulphide Carbon.—Write, stating full particulars, "Veritas," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

CHEMIST (24) seeks post; trained technical college and six years' experience large works' laboratories; careful analyst, good knowledge organic chemistry, could research; good references.—"1,635," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

CASED JARS.—Basket-cased One-gallon Jars for Sale at 13s. per dozen, delivered free in London.—Sample will be sent on application to The "Sanitas" Company, Limited ("N" Dept.), Locksley-street, Limehouse, London, E.

PEAT CHARCOAL.—500 tons wanted.—Price and full particulars to P. M. Short, 24, Dulwich-road, Herne Hill, London.

CHEMICAL Plumber and Lead Burner, expert workman, will estimate for general lead work, etc., or supply labour only (9½d. per hour).—Address, X. Y. Z., *Chemical Trade Journal* Office, Manchester.

CURRENT TOPICS.

THE BOARD OF TRADE AND INDUSTRIAL DISPUTES.

WITHIN the last month the President of the Board of Trade has been successful in preventing the occurrence of two serious strikes, both of which would have had grave consequences for the staple industries of the country. Mr. Lloyd-George's intervention in the railway trouble will be fresh in the minds of our readers; his more recent mediation in the dispute in the cotton trade, though not of the same degree of importance, is none the less a matter of great interest. Any suspension of operations in the Lancashire cotton industry reacts almost immediately on many branches of chemical manufacture, and therefore the peaceful issue of the negotiations will be welcomed by all concerned in the closely allied industries.

The task of averting a strike in connection with this latter labour trouble, although not concerned with such vast interests as those involved in the railway crisis, was still a very difficult one. The points at issue were of a peculiar and highly technical nature, and the success attending the intervention of the Board of Trade was largely due to the fact that Mr. Lloyd-George very wisely refrained from attempting to deal with them in detail. Instead of this, he persuaded the representatives of both sides to agree to a fortnight's truce, and during this interval to refer a disputed clause in the famous "Brooklands agreement" (which largely governs the question of wages in the cotton trade) to the Law Officers of the Crown for their opinion as to its application in this particular instance. Pending their decision, he also succeeded in obtaining a continuation of friendly discussion of the technical points involved, and the result of his intervention has been a decision which satisfies both parties to the dispute, and which will, in all probability, ensure prolonged peace, as in the case of the railway settlement.

It seems to us that the activity of the President of the Board of Trade in connection with such negotiations will probably result, at no distant date, in an attempt at legislation with the object of establishing some impartial body, whose office it will be to play the part, in industrial disputes generally, which Mr. Lloyd-George has so successfully initiated. We believe that the time is ripe for some such step on the part of the Government. Its success would of course very largely depend on wise administration, but with the present officials at the

Digitized by Google

Board of Trade we see no reason to doubt the possibility of a good beginning, and such a departure could not fail to be highly beneficial to British trade and commerce. The spirit of conciliation and compromise has been markedly in evidence of late, and a serious attempt to obviate these periodical and costly struggles would, we believe, be warmly welcomed in industrial circles.

THE TRAINING OF ENGINEERS.

Writing in the *Glasgow Herald* on laboratory work as a training ground for the engineer, Professor A. L. Mellanby suggests that this is a matter the importance of which has not hitherto been sufficiently recognised. The usual laboratory work tends merely to familiarise the young engineer with the subjects taught him in the lecture room; a training on such lines, though useful enough in its way, should be only the beginning and not the sum total. In addition, the student should be made familiar with the methods of research work by attacking some of the numberless problems in engineering still awaiting solution. After going through the ordinary curriculum of the engineering college, the student, at the age of nineteen, has a theoretical knowledge of engineering; he can test specimens of materials, take indicator cards and conduct an ordinary engine or boiler trial, but he can make no practical use of his scientific knowledge, and if employed to act on his own responsibility would fail badly.

The natural conclusion is that the average college training is absurd and inadequate. It is the result of years of educational incompetence, due, for the most part, to the attitude of employers. Any advance in education has been because students, feeling the necessity for information, have attended engineering courses with absolutely no encouragement from outside sources. At the present day, employers are gradually becoming willing to support a scheme of education which they realise as being advantageous to themselves. The usual reply of employers—and it is not without a certain amount of truth—on the subject of college-trained youths has been that such men are not worth the money spent on them. From their point of view the employers are right, as the ordinary college student has had no actual engineering experience. The remedy is obvious. Instead of wasting vast sums of money on technical education, workshop practice should be made a *sine quâ non* of the college scheme of work. That such a proposition would cause some inconvenience is certainly true. A youth of nineteen is generally of some value to his employer, who naturally objects to parting with him for two or three years for what, in his opinion, are purely problematical reasons. "Unless, however, engineers of this country are to become mere copyists and to confine themselves to the manufacture, under licence, of foreign inventions, it is necessary," says Prof. Mellanby, "that some sacrifice should be made. It would be but an investment certain to produce a big return in a few years."

The student, he continues, must not only have a working acquaintance with engineering practice, but must be prepared with sufficient knowledge of mathematics and physics to take up his technical studies at the college with profit. It is a natural corollary that there must be a continuity of theoretical study between school and college. The youth who neglects his education on leaving school, who, after some years with an engineering firm, determines to take a college training, finds that his knowledge of science and mathematics is so small that he cannot take advantage of the higher technical lectures, and, in consequence, wastes time in trying to obtain that elementary knowledge that he might easily have acquired had he continued his studies on leaving school.

The student after leaving school should immediately proceed to college and there take up the first year general course. At the close of the college session he ought to enter an engineering works, where he should remain for at least three years. During these three years he would keep up his studies, especially devoting himself to mathematics and physics. At the end of this time he ought to return to college and take, during the winter session, the second year's course. The following summer would be again spent in the workshops, and the next winter would be devoted to the third and final course of college work. This scheme bears some resemblance to the oft-discussed "sandwich" system, but there are sufficient differences to ensure that the comparative failure of the old scheme will become the absolute success of the new one. It is essential for its success that there be continuity of theoretical work from the time the student leaves school, and no apprentice ought to be allowed to take up the second year's college course unless he could produce evidence of having made material progress in his mathematics and natural science during the three years spent in the works.

The advantages of such a scheme will be readily apparent. The student would take up his second and third years' college work with such a preliminary training that the whole character of present-day college classes would be changed. The laboratories, instead of being places for elementary testing, might develop into schools for real research. Practical problems that had arisen during workshop experience might be settled by direct experiment, and an amount of information gathered that would, in a short time, lead to an immense improvement in our national engineering.

The great difficulty in carrying on experimental work outside the colleges is the lack of suitable men. The scheme under consideration insists upon the great importance of laboratory work in the production of the right type of engineer. Laboratory work of the proper kind cannot be carried out unless students have had considerable engineering experience; in order to ensure the success of the course, the co-operation of engineering firms with the colleges is essential. Facilities for carrying on workshop and college training side by side must be provided, and the question of a slight amount of works disorganisation ought not to stand in the way of its adoption. Modifications of the scheme may be suggested, "but," says Prof. Mellanby, in conclusion, "it is of enormous importance that the present haphazard methods should be abandoned, and some definite agreement come to between works and college."

BOARD OF TRADE RETURNS.

The Board of Trade returns for November show considerable increases in both imports and exports for the month. The total imports (value, c.i.f.) amounted to £57,145,099., against £55,747,079. in the corresponding month of last year, an increase of £1,398,020.; the comparison with 1905 shows a gain of £4,009,203. The total imports for the eleven months are £36,536,297. above the figures for the corresponding period of last year, and

Digitized by Google

£77,753,435. as compared with 1905. The total exports for November (value, f.o.b.) amounted to £35,862,176, against £32,975,162. in November, 1906, an increase of £2,887,014.; and an increase of £6,254,027 as compared with 1905. The total exports for the eleven months of 1907 are £49,199,122. above the figures for last year, and £92,091,587. over 1905.

The imports of chemicals, drugs, dyes and colours in November amounted to £979,547., against £884,200. in 1906, an increase of £95,347. The imports of bleaching materials were valued at £3,029., against £4,278., and of soda compounds £12,611., against £12,803. in 1906.

The exports of chemicals, drugs, dyes and colours in November amounted to £1,374,360., against £1,360,483. in 1906, an increase of £13,877. During the month the principal items were:—Bleaching materials, 89,485 cwts., valued at £20,708., against 89,496 cwts. and £17,733. in 1906. Coal products (not dyes), value £147,791., against £129,070. in 1906. Copper sulphate, 1,359 tons, valued at £31,127., against 887 tons and £23,326. in 1906. Dyestuffs, £31,795., against £32,878. in 1906. Glycerine, £31,231., against £25,790. in 1906. Chemical manure, 43,555 tons, valued at £337,794., against 49,611 tons and £326,661: Muriate of ammonia, 11,182 cwts., valued at £14,582, against 15,926 cwts. and £20,587. in 1906. Painters' colours and materials, 160,492 cwts., valued at £203,761, against 157,107 cwts. and £194,796. in 1906. Soda compounds, 482,329 cwts., valued at £157,233., against 628,577 cwts. and £184,447. in 1906. The exports of salt in November amounted to 35,293 tons, valued at £29,872., against 47,196 tons and £35,014. in 1906. Exports of "unenumerated chemicals" were valued at £250,797., compared with £257,589. in 1906.

The imports of oil seeds, nuts, oils, fats, and gums in November amounted in value to £2,481,753., against £2,283,803. in 1906., an increase of £197,950. The figures for petroleum were: 28,048,955 gallons, valued at £584,594., against 29,197,061 gallons and £545,397. in 1906. The value of exports of oil seeds, nuts, oils, fats, and gums was £354,612., against £270,530., an increase of £84,082.

The imports of metals and minerals during November were:—Copper ore, 7,205 tons, valued at £69,907., against 6,423 tons and £63,605. in 1906. Copper (regulus and precipitate), 5,163 tons, valued at £195,674., against 4,705 tons and £215,489. in 1906. Lead (pig and sheet), 19,108 tons, valued at £36,144., against 17,184 tons and £321,146. in 1906. Pyrites of iron and copper, 54,177 tons, valued at £83,167., against 47,643 tons and £82,387. in 1906. Quicksilver, 53,850 lbs., valued at £4,674. (no imports in November, 1906). Silver ore, value £264,832., against £178,341. in 1906. Tin, 3,797 tons, valued at £529,669., against 3,932 tons and £166,253. Zinc (crude), 7,267 tons, valued at £156,269., against 9,126 tons and £236,823.

THE FARADAY SOCIETY.—An ordinary meeting of the Society will be held on Tuesday, December 17, at 8 p.m., in the Library of the Institution of Electrical Engineers, 92, Victoria-street, S.W. Dr. F. G. Donnan will read a paper on "A Physico-Chemical Study of the Complex Copper-Glycocoll Sulphates," by J. T. Barker, B.Sc. Dr. F. Mollwo Perkin will lecture on "The Centenary of the Discovery of the Alkali Metals by Davy: The Industrial Developments of the Discovery." The lecture will be illustrated. The secretary will be glad to receive contributions to the discussion from those unable to be present at the meeting.

NITRATE OF SODA.

THE gradual increase in the supply of labour in Chili, recently referred to in these columns, is shown by last month's output, which reached 172,637 tons, against 172,223 tons in October (with one day more) and 164,133 tons in November, 1906. The total is the largest yet attained in any one month in the history of the nitrate industry, as is also that of stocks on the West Coast at this time of the year, namely, 560,000 tons against 445,000 tons on 1st December, 1906. These formidable figures, counteracting the moderate November shipments, account for last week's market weakness, but, as was to be expected, labour troubles are once more reported as likely to hinder shipping operations. Notwithstanding a large advance in wages, the workmen at Iquique are said to have gone on strike, and difficulties have arisen at some of the minor ports. A somewhat firmer tone has consequently been imparted to the markets on this side, without any increase of business, however, buyers being content to wait developments. Cargoes arriving at ports of call are ordered away unsold, yet another having been sent to Dunkirk! Hamburg has special financial difficulties to contend with, and Belgian stocks are about twice as large as at this time last year. According to the circular (dated 6th inst.), of Messrs. Henry Bath and Son, statisticians to the Permanent Nitrate Committee, "whereas there were buyers earlier in the fortnight at 8s. 6¼d. per quintal for second half of 1908 shipment, there now seems little prospect of sellers obtaining more than about 8s. 2½d. to 8s. 3d., free alongside for the same thing." The position in Chili has certainly not improved with the threatened further accumulation of stocks through strikes, and an important Bank with large nitrate interests has failed. European holders of the fertiliser may put up their prices if shipments are seriously delayed this month, but consumers have as yet no cause for alarm.

THE FRANCO-BRITISH EXHIBITION.

THE work of erecting the various buildings in connection with the Franco-British Exhibition is now rapidly nearing completion, and on Thursday, the 12th inst., about 700 guests of the Duke of Argyle inspected the progress made. Most of the steel work has already been erected, and there is every indication that the buildings will be completed in ample time for the reception of exhibits; in fact, it is confidently asserted that some of them will be finished early in January next. It has been stated that British manufacturers do not favour exhibitions, owing to the opportunity afforded to foreign rivals of copying their specialities. The question which, however, presents itself is not whether it pays to exhibit, but whether, under modern conditions, manufacturers can afford not to exhibit. In the various buildings set apart for the chemical and allied industries, exhibitors will have a splendid opportunity of displaying their best manufactures, and it cannot be too readily taken advantage of, since France has evidently determined to make every possible use of the Exhibition to display her finest products. The Exhibition will, it is hoped, emphasise both to England and France the importance of an interchange of their respective commodities.

Obituary.—We regret to record the death of *Mr. Samuel Hall, F.I.C., F.C.S.*, of the well-known firm of Edward Cooke and Co., East London Soap Works, Bow, and Honorary Treasurer of the Society of Chemical Industry. Mr. Hall was taken ill late in November, but at first it was confidently expected that he would recover; unfortunately, however, his strength failed, and he passed away peacefully on Monday last, to the deep sorrow, not only of the family and their immediate connections, but of the whole of the staff of Edward Cooke and Co., who have for so many years been associated with him, and who realised his innate kindliness and generous spirit.

METALS AND MINERALS IN SPAIN.

CARTHAGENA.

MR. VICE-CONSUL GRAY reports that the quantities of iron and manganiferous ores shipped during 1906 were to the following countries:—United Kingdom, 405,976 tons; Netherlands (for Germany), 211,182 tons; France, 15,756 tons; Germany (direct), 1,000 tons; Italy, 2,700 tons; United States, 32,675 tons; Austria-Hungary, 25,250 tons; total, 694,539 tons. This was 248,504 tons more than in 1905, or 379,514 tons more than in 1904. The demand for iron ores increased enormously in 1906, and mining has in consequence been carried on at the highest pressure; but, notwithstanding this, the production has fallen far short of the demand. The Cehegin or Calasparra magnetic ore, which was looked on at first somewhat suspiciously, is now in great demand. The output can scarcely satisfy half the wants.

The following were the exports of lead:—Silver-lead: United Kingdom, 20,457 tons; France, 9,776 tons; total, 30,233 tons. Soft lead: United Kingdom, 9,310 tons; France, 3,540 tons; Netherlands, 2,610 tons; Germany, 565 tons; Italy, 560 tons; Belgium, 710 tons; total, 17,295 tons. The quantity of silver-lead sent to the United Kingdom was 517 tons more than in the previous year and should have been still greater, as between 1,500 and 2,000 tons were shipped in January, 1907, which ought to have gone in December, 1906, but were put back for want of timely tonnage. To France the quantity was 2,974 tons less than in 1905, but there were some small stocks in hand at the end of the year which ought to have been shipped before. The exact quantity cannot be given, but it was somewhere about 500 tons; so, taking into consideration those late-shipped quantities, the total year's production of silver-lead may be calculated to be about 2,500 tons less than in 1905. The total quantity of soft lead exported in 1906 was less by 3,061 tons than in 1905. The United Kingdom got 1,140 tons less, which may be attributed partly to the smaller total exported and partly to the greater facilities for shipping direct to other countries. Much of the soft lead which formerly was sent to London, as a point of distribution, is now shipped direct to the countries which want it.

Taking silver and soft lead together, the product of 1906 was shorter by 5,500 tons than that of 1905. So far as I can find out the output of mines in this immediate neighbourhood was more or less the same as usual, but as smelters depend as much, or perhaps more, on ore brought from places outside this district, it was in those places where the shortage arose. The price of lead during the year ruled very high—higher than for many years. It began the year at £17. 15s. 9d. per ton, got down to £15. 11s. 3d. about the middle of March, went on rising from that date, with slight fluctuations, until it reached £20. 1s. 3d. for one day in October, and then fluttered on at a little lower rate until December 20, when it again reached £20. 1s. 3d., and so continued till the end of the year. Such prices have not obtained since about the later seventies of last century.

About the same quantity as usual of soft lead was sent to Barcelona from here, *viz.*, 3,615 tons. There were exported in 1906 32,322 kilos. of silver, equal to 1,039,152 ozs. troy, all to France—2,693 kilos. less than in 1905. The price at the beginning of the year was 2s. $7\frac{1}{32}$d. per oz., and it did not fall below this figure during the year. It reached its highest in November at 2s. $11\frac{3}{32}$d. per oz., and saw the year out at 2s. $10\frac{31}{32}$d. per oz.

The following quantities of zinc ore were shipped to the countries named:—Blende: Belgium, 55,210 tons; United Kingdom, 6,994 tons; Germany, 15,025 tons; France, 1,117 tons; total, 78,346 tons. Calamine: Belgium, 9,951 tons; Germany, 5,561 tons; France, 1,102 tons; United Kingdom, 626 tons; total, 17,240 tons. These exports together amount to 7,156 tons more than in 1905. The figures include very large stocks which were in hand at the end of 1905. Consumers were over-stocked then, and seem to have been so ever since. They retarded deliveries, and would not admit new quantities except at prices which did not bear any comparison to the price of zinc (metal). The consequence was that some mines did not produce and others held their stocks. What went forward was chiefly contracted for previously, though the product of one or two specially favoured mines was also shipped.

The exports of copper ore and matte were:—Ore: United Kingdom, 406 tons; France, 36 tons; total, 442 tons. Matte: United Kingdom, 155 tons; Germany, 23 tons; total, 178 tons. This was 50 tons more ore and 104 tons more matte than were shipped in 1905. This district does not produce copper in large quantities.

The shipments of iron pyrites during the year were:—To France, 3,425 tons; Italy, 380 tons; total, 3,805 tons; or 1,350 tons more than in 1905. The United Kingdom took 1,020 tons in 1905 and nothing in 1906. Any quantity of this ore could be mined if prices were remunerative.

The shipments of sulphur were:—To United Kingdom, 860 tons; Belgium, 40 tons; total, 900 tons.

Apart from the natural phosphates brought here for the purpose of being manufactured into serviceable manure, the following quantities of other artificial manures were imported in 1906 from the countries named:—Germany, 511 tons; Chile, 680 tons; France, 1,778 tons; Netherlands, 140 tons; United Kingdom, 878 tons; total, 3,987 tons.

Also under the special heading of "Superphosphates and Thomas slag" there were the following imports:—Belgium, 20 tons; France, 375 tons; Netherlands, 615 tons; United Kingdom, 945 tons; total, 1,955 tons.

One of the signs of improvements in matters connected with the cultivation of the soil is the increasing use of chemical manures. Other modern methods of treating the ground and its produce are sure to follow, though their adoption will at first be slow and gradual.

The mining industry of Carthagena was much the same as in the previous year, so far as regards the mining of lead and zinc ores, although it was somewhat restricted in some mines owing to the reluctance or refusal of over-stocked consumers to receive zinc ores not already contracted for. Iron ore mining has been pursued vigorously and extensively owing to the abnormally heavy demand for this class of mineral. The drainage of a large and important area in this mining district, where big deposits of lead, zinc and manganiferous ores are known to exist, is being continued, but hitherto not with the desired success. Hopes are entertained that the undertaking will be finally successful, and when this takes place the supply of the ores indicated is expected to be greatly increased.

Society of Chemical Industry: *Liverpool Section.*—The Hon. Local Secretary informs us that no meeting of the Section will be held during December.

The Soap Industry in India is capable of developing into a very large trade. Comparatively few of the 300,000,000 inhabitants know the use of soap yet, but it is slowly and surely making its way into favour. Even the Calcutta coolie who takes to soap refuses to go back again to the Ganges mud!

Copper in Mexico.—According to a statement issued by the Department of Fomento, there are in the Republic more than 1,000 mines working principally for copper. Of these the State of Jalisco has 302, Sonora 234, Michoacan 95, Lower California 65, Chihuahua 53, and Durango 51. As regards tonnage, the State of Sonora is first, while Lower California comes next. This latter company, which sends all its shipments to Europe, is smelting more than 25,000 tons of ore and producing about 2,000,000 lbs. of copper per month. The latest reports from this territory of Lower California are to the effect that rich placer ground is being found on the Rio Tia Juana, about 80 miles south-east of San Diego, Cal., and that a large Los Angeles company is prepari g to start dredging operations.

THE INTERNATIONAL PETROLEUM CONGRESS.

THE recent International Petroleum Congress at Bucharest is the subject of a report in the *Engineering and Mining Journal* (New York) by Mr. David T. Day, Chief of the Bureau of Statistics, U.S. Geological Survey. The Congress, which was attended by over 400 members, was a complete success, and resulted in a great gain in the knowledge of the origin and theories of petroleum, as well as in the development of its technology. Perhaps the best result attained was the knowledge of the necessity for adequate means of separating crude petroleum into its constituent hydrocarbons as a prelude to drawing conclusions regarding the nature of various oils. The proceedings commenced with a lecture by Prof. Mrazek, the Chief of the Geological Survey, who traced not only the geological structure, but also the recent development of oil territory to the S.W. An excursion to this field followed the lecture, in which the refinery interests were seen and all the important oil fields studied. Amongst other places visited by the party were the oil wells at Tsinea, the refinery of Aurora, the wells and refinery of Recea, Bushtenari the Great—the Roumania oil mecca, the foremost field of all on account of its prolific yield and the good lubricating oils obtained from its residue, and lastly Moreni, a field in high favour, though the complicated geology makes drilling a veritable lottery.

On their return to Bucharest the party settled down to discuss some seventy papers on geology, chemistry, and economics, the University Building being given over to them for the purpose. In Section I. (Geology), Prof. Mrazek gave a study of courses taken by oils in Roumania, showing experimentally the behaviour of petroleum to shales, and insisting upon the importance of moisture in the shales. He demonstrated that such absorption of oil in a shale does not furnish an oil supply; super-saturation is the essential thing. For this he showed that it was only necessary for water to enter the oil-saturated shale and drive out the oil into some other reservoir. Prof. Mrazek further demonstrated the capacity of a moist shale to serve as the best possible cover for an oil pool.

Prof. Engler re-elaborated his ideas of the animal origin of petroleum. He asserted that he had found certain natural crude oils which agreed in optical activity with his artificial product. He next showed that search for an animal residue which could yield petroleum, optically similar to the usual natural crudes, had been successful with cholesterin; he regarded this, in consequence, as the natural petroleum source. In the discussion following this paper Hoefer spoke decidedly in favour of the animal theory; Mrazek, as an argument against the inorganic origin, laid perhaps too much stress on the absence of oil deposits in volcanic regions.

In Section II., Engler, Zaloziecki, Rakussin, and others carried the war as to the origin of petroleum into the camp of the chemists. The discussion which followed emphasised the necessity for a method of separating each crude oil into its hydrocarbons, and the classification of each oil by the quantity of each hydrocarbon which it contains, instead of, as is done now, naming an oil geographically. Roumanian work has shown that crude oils offer a better source of supply than coal-tar for hydrocarbons of the benzol series, It is certain that German and Roumanian laboratories will soon draw on these oils as the basis of the aniline dye and similar industries.

In Section III., Dr. Paul Schwartz, of Berlin, Dr. Paul Dvorkovitz, of London, and others contributed papers dealing with the statistical conditions of their respective countries. Methods of unification for testing oil products were discussed, and finally, as a compromise, a tentative set of international methods was adopted, and the remainder were referred to an international committee consisting of two members from each country. The proceedings were throughout marked by great cordiality on the part of the Roumanian Government.

The next meeting will be held in Lemberg, Galicia, in 1910.

THE INDIAN MANGANESE INDUSTRY.

IN the course of an article in the *Journal* of the British Society for the Encouragement of Arts, Manufactures, and Commerce, on the manganese industry, Mr. A. Ghose expresses the opinion that in a few years' time India is likely to be the leading producer of this metal. At present India supplies more manganese ore to the iron furnaces of Great Britain than any other country, and her export to Continental and American ports is also steadily increasing. Indian ores have several important advantages over Russian ores to give them preference in smelting establishments, their compact structure, hardness, friability, and absence of dust, making them easy to handle. There are, at present, no facilities in India for smelting ores on the spot, as the deposits are far removed from any sort of fuel, and a considerable amount of ore is wasted every year, as it is too low-grade to stand the cost of transportation.

No exportation of pyrolusite has taken place from India, although this ore has been met with in some places, notably at Pali, some six miles from Munsur, Central Provinces. The ore has yielded 62% of manganese. The manganese quarries of Vizagapatam are situated near a seaport, and there has, in consequence, been a profitable exploitation of a middle-grade ore containing high percentages of phosphorus, and suitable for the basic process. The ore extracted from the Nagpur Mines, in the Kamptee district, has been the highest grade yet exported, but its percentage of silica exceeds the limit of standard requirements. Amongst other deposits noted for the excellence of their ore are Ramtek, Munsur, Kachurwahi, Manegaon, and Kodaigon; the mines at Bhandara and Balaghat show extraordinary developments of ore bodies, and are being actively exploited. In the Jubbulphur area, in the neighbourhood of Chaibassa, in Bengal, and in the Mysore, Shinioga, Chitaldrug, and Tumkur districts, everything is practically in the hands of manganese exploiters, hundreds of miles being taken up under prospecting licences. A quantity of good psilomelane has been exported from the beds in the neighbourhood of Kumsi. In the Sandur State mining operations are proceeding on a large scale; the ore of this locality, being non-siliceous and non-phosphoric in character, is in great demand.

In Portuguese India the deposits are all in laterite, and, for the most part, limited in life. Amongst the principal mines are Sancordem, Candiapar, Fanuswadi, and Wagy. The proximity of Marmagoa harbour to these mines affords facilities for working even an inferior grade of ore; but the capacity of the harbour is limited, and unless this defect is remedied, the South Indian manganese industry will receive a severe check. A combination—now almost out of the question—could have averted the present competition to a marked extent.

Bequest to Manchester University.—The late Professor Thomas Barker, formerly of Owens College, has left to the University of Manchester property that will probably amount to about £40,000., or, after payment of legacy duty, to about £36,000. The bequest is to found a Professorship of Cryptogamic Botany, and to provide bursaries or scholarships.

Messrs. Michael Pal and Co., of Parliament Mansions, Victoria-street, S.W., inform us that they have been appointed sole agents for the United Kingdom and the Colonies of Messrs. Louis Schwarz and Co., Aktiengesellschaft, Dortmund, who are specialists in low-pressure steam turbines, condensing plants, cooling towers, and heat accumulators, and who have special designs for cleaning efficiently blast-furnace gases, to be utilised for driving large gas engines.

Continental Notes.

IN the *Chemiker-Zeitung* for November 16, K. Millberg writes on the roasting of copper pyrites and the extraction of the copper without roasting with chlorine. Formerly it was usual always to chlorinate before extracting, but now the endeavour is generally made to render the greater part of the copper soluble in sulphuric acid without further treatment. In the Herreshoff furnace it is not difficult to conduct the process in such a way that 92 to 95% of the copper can be extracted, but with the Maletra furnace it is seldom possible to exceed 80 to 85%.

In order to obtain a satisfactory result, it is necessary that the ore should be finely ground and that the roasting be thorough, otherwise cuprous compounds are formed which are insoluble. In such cases the author recommends that the material should be oxidised by roasting with ferric sulphate. This is done either by adding the ferric sulphate in the lowest shelf of the furnace, or by treating with sulphuric acid, drying, and roasting. The subsequent separation of the copper from the iron and other metals present is performed by fractional precipitation with milk of lime. The iron is first precipitated at a temperature of 40° to 50° C., and then the copper by careful treatment with the lime, precautions being taken that the process is not carried so far that the nickel, cobalt, and other metals are also thrown down. These metals can then be precipitated in the same way.

In the same issue Dr. C. Grimaldi has a paper on the colour reactions of rosin oil (pinolin) with tin and concentrated hydrochloric acid and with Halphen's reagent. These reactions serve to distinguish the material from turpentine, camphor oil, and other similar substances.

The issues of the *Chemiker-Zeitung* for November 20 and 23 contain a paper by R. Zaloziecki and H. Klarfeld on the optical activity of petroleums and its bearing upon the question of origin. A considerable number of samples from different localities were examined in the polarimeter, both as obtained from the wells and also after submitting them to fractional distillation in vacuo. It was found that the higher-boiling fractions from Russian petroleum were mostly active, whereas all the fractions from Pennsylvanian petroleum were as a rule inactive. Of the Galician oils some yielded active distillates and some did not. The authors are of the opinion that these differences are due either to differences in the material from which the oils were originally formed, or to differences in the age of the material, the Pennsylvanian oils being considerably older than the Russian.

In the issue of November 20 there is also a paper by A. von Bartal, on Lancien's radioactive molybdenum compound. The author has prepared "molybdot," UO_2MO_4, but has found that it is no more active than the uranium nitrate from which it has been made. Lancien's statements as to the high degree of activity possessed by this compound were not confirmed.

In the same number H. Schreib discusses the recent developments in the purification of effluents, and deals especially with the waters from sugar factories, potash works, and factories where the sulphite-cellulose process is in operation.

On November 23 J. D. van der Waals celebrated his seventieth birthday, and to the issue of the *Chemiker-Zeitung* for that date J. Traube contributes an article in celebration of the event. He calls attention to the great advances, both in theory and practice, that have followed van der Waal's discovery of the "equation of state." By introducing into the equation connecting volume, pressure, and temperature symbols to represent the co-volume of the atoms and the internal pressure, many phenomena have found an explanation, and it has been possible to calculate approximately some of the properties of the molecules themselves. Van der Waal's fundamental idea is that the gaseous and liquid states only differ from one another in the difference in the distance between the molecules. The calculation of the internal pressures of solid and liquid bodies leads to some interesting figures; the liquids, for instance, lie as a rule between 800 and 3,000 atmospheres at ordinary temperatures, solid gold has an internal pressure of about 180,000 atm., and diamond 5,500,000 atm. The equation of state is also of importance as throwing a light upon the phenomena connected with the critical point, and investigations of these phenomena are now proceeding.

In the same issue there is a description of a single-cylinder pump, with which it is possible to obtain a vacuum of 1 mm.

Correspondence.

*** *We do not hold ourselves responsible for the opinions expressed by our correspondents.*

POWDERED AND LIQUID BLUE FOR LAUNDRY PURPOSES.

(To the Editor of the Chemical Trade Journal.)

SIR,—Can you or any of your readers enlighten us, through your correspondence columns, on the following point, respecting powdered blue and liquid blue for laundry purposes?

So far as we are aware, the only perfectly satisfactory blue on the market contains Prussian blue and oxalic acid. Although oxalic acid is a scheduled poison, and is contained in most of the blues on the market, the authorities have not yet put the Poisons Act in force by making a conviction.

Are we running any risk in going with the trade in using oxalic acid in the manufacture, or do you consider that, seeing our trade is principally with grocers, we should not send it out?

We may add that our sole object is to sell a good article, the question of cost not being considered by us.—Yours, etc.,

INQUIRER (GLASGOW).

THE COPPER POSITION.—Messrs. Henry R. Merton and Co., in their weekly report on copper, say:—Trade on this side of the Atlantic is still satisfactory. The electrical business, the main outlet for copper, has revived in a marked degree, especially on the Continent, and numerous orders have been given out during the last few weeks. Other branches have also benefited by the lower level of values, and better reports are received from the brass trades, while the constant increase of requirements by railways is bringing work to rollers and tube manufacturers. In addition to this, India has again entered the market, and placed fair orders for copper and yellow metal sheets. On the other hand, the low prices are telling upon the supplies from countries like Australia, Japan, and Chili, and not a little has been diverted to China. Europe is, therefore, in a position to receive more copper from the States, and though it may take some time to distribute the large quantities which have been shipped over here and are still coming, the surplus is not very important, considering that consumers are still refraining from laying in stocks under present monetary conditions. The shifting of the accumulation in America leaves only the current output for home requirements, and, reduced as these are at present, they should be enough to absorb what is not booked for export, seeing that many mines have closed down and others are producing considerably less than previously. In Europe, also, electrolytic copper has steadily risen, and the Amalgamated Company have again been doing a large business.

THE NEW CUSTOMS TARIFF OF THE DOMINION OF NEW ZEALAND.

A SUPPLEMENT to the *Board of Trade Journal* of November 21 contains the full text of the "Tariff Act, 1907," of the Dominion of New Zealand, which was assented to on September 25 last. This Act, so far as relates to the rates of duty, came into force on July 17th, 1907, and makes various amendments in the proposals originally submitted to Parliament.

We give below a special abstract of the Tariff. The Act provides that where any dispute arises as to the true meaning and application of any terms used in the Tariff, and therein printed in italics, the Minister of Customs may determine such dispute in such manner as appears to him just, and his decision thereon shall be final.

SCHEDULE A.

Names of Articles.	Old Rates of Duty.		New Rates of Duty.	
	General Tariff.	Tariff on Goods the Produce or Manufacture of some part of the British Dominions.	General Tariff.	Tariff on Goods the Produce or Manufacture of some part of the British Dominions.

SACCHARINE LITIGATION.—In the High Court of Justice, Dublin, on the 12th ult., before the Master of the Rolls, an application was heard at the suit of the Saccharin Corporation, Ltd., Belfast, for liberty to strike out the defence by Messrs. Holmes, aerated water manufacturers, Belfast, to an action brought by plaintiffs, on the ground that defendants had failed to answer certain questions put by the Court. The action was to restrain defendants from infringing plaintiffs' patent by importing, using and selling in Ireland saccharin made in accordance with the plaintiffs' specification and in a manner only colourably differing from same. The desired order was made by the Court.

THE OUTPUT OF COAL.—The Board of Trade return on the coal trade of the world, which has just been issued, shows that 837,100 persons were employed in the coal mining industry of the United Kingdom during the year 1906, the figures for other countries being:—United States, 626,300; Germany, 493,300; France, 171,500; and Belgium, 134,700. As regards the output per person employed, the United States had first place with an output of 560 tons per person, the United Kingdom second place with 280 tons; followed by Germany, France, and Belgium with 242 tons, 202 tons, and 159 tons respectively. The total production of coal in the United Kingdom for 1906 was 251,068,000 tons, America being first with 379,672,000 tons.

THE NEW PATENTS ACT.

(*Continued from page 497.*)

PART II.—DESIGNS.

Legal Proceedings.

60.—(1.) During the existence of copyright in any design it shall not be lawful for any person—

(*a*) For the purposes of sale to apply or cause to be applied to any article in any class of goods in which the design is registered the design or any fraudulent or obvious imitation thereof, except with the licence or written consent of the registered proprietor, or to do anything with a view to enable the design to be so applied; or

(*b*) Knowing that the design or any fraudulent or obvious imitation thereof has been applied to any article without the consent of the registered proprietor to publish or expose or cause to be published or exposed for sale that article.

(2.) If any person acts in contravention of this section he shall be liable for every contravention to pay to the registered proprietor of the design a sum not exceeding fifty pounds, recoverable as a simple contract debt, or if the proprietor elects to bring an action for the recovery of damages for such contravention, and for an injunction against the repetition thereof, he shall be liable to pay such damages as may be awarded, and to be restrained by injunction accordingly:

Provided that the total sum recoverable as a simple contract debt in respect of any one design shall not exceed one hundred pounds.

61.—The provisions of this Act with regard to certificates of the validity of a patent, and to the remedy in case of groundless threats of legal proceedings by a patentee shall apply in the case of registered designs in like manner as they apply in the case of patents, with the substitution of references to the copyright in a design for references to a patent, and of references to the proprietor of a design for references to the patentee, and of references to the design for references to the invention.

PART III.—GENERAL.

Patent Office and Proceedings thereat.

62.—(1.) The Treasury may continue to provide for the purposes of this Act and the Trade Marks Act, 1905, an office with all requisite buildings and conveniences, which shall be called, and is in this Act referred to as, the Patent Office.

(2.) The Patent Office shall be under the immediate control of the comptroller, who shall act under the superintendence and direction of the Board of Trade.

(3.) Any act or thing directed to be done by or to the comptroller may be done by or to any officer authorised by the Board of Trade.

(4.) Rules under this Act may provide for the establishment of branch offices for designs at Manchester or elsewhere, and for any document or thing required by this Act to be sent to or done at the Patent Office being sent to or done at any branch office which may be established.

63.—(1.) There shall continue to be a comptroller-general of patents, designs, and trade marks, and the Board of Trade may, subject to the approval of the Treasury, appoint the comptroller, and so many examiners and other officers and clerks, with such designations and duties as the Board of Trade think fit, and may remove any of those officers and clerks.

(2.) The salaries of those officers and clerks shall be appointed by the Board of Trade, with the concurrence of the Treasury, and those salaries and the other expenses of the execution of this Act and the Trade Marks Act, 1905, shall continue to be paid out of money provided by Parliament.

64.—Impressions of the seal of the Patent Office shall be judicially noticed and admitted in evidence.

Fees.

65.—There shall be paid in respect of the grant of patents and the registration of designs, and applications therefor, and in respect of other matters with relation to patents and designs under this Act, such fees as may be, with the sanction of the Treasury, prescribed by the Board of Trade, so, however, that the fees prescribed in respect of the instruments and matters mentioned in the First Schedule to this Act shall not exceed those specified in that Schedule.

Provisions as to Registers and other Documents in Patent Office.

66.—There shall not be entered in any register kept under this Act, or be receivable by the comptroller, any notice of any trust expressed implied or constructive.

67.—Every register kept under this Act shall at all convenient times be open to the inspection of the public, subject to the provisions of this Act and to such regulations as may be prescribed; and certified copies, sealed with the seal of the Patent Office, of any entry in any such register shall be given to any person requiring the same on payment of the prescribed fee.

68.—Reports of examiners made under this Act shall not in any case be published or be open to public inspection, and shall not be liable to production or inspection in any legal proceeding, unless the court or officer having power to order discovery in such legal proceedings certifies that such production or inspection is desirable in the interests of justice, and ought to be allowed.

69.—(1.) Where an application for a patent has been abandoned, or become void, the specifications and drawings (if any) accompanying or left in connection with such application, shall not, save as otherwise expressly provided by this Act, at any time be open to public inspection or be published by the comptroller.

(2.) Where an application for a design has been abandoned or refused the application, and any drawings, photographs, tracings, representations, or specimens left in connection with the application shall not at any time be open to public inspection or be published by the comptroller.

70.—The comptroller may, on request in writing accompanied by the prescribed fee,—

(*a*) correct any clerical error in or in connection with an application for a patent or in any patent or any specification;

(*b*) cancel the registration of a design either wholly or in respect of any particular goods in connection with which the design is registered;

(*c*) correct any clerical error in the representation of a design or in the name or address of the proprietor of any patent or design, or in any other matter which is entered upon the register of patents or the register of designs.

71.—(1.) Where a person becomes entitled by assignment, transmission, or other operation of law to a patent, or to the copyright in a registered design, the comptroller shall, on request and on proof of title to his satisfaction, register him as the proprietor of a patent or design.

(2.) Where any person becomes entitled as mortgagee, licensee, or otherwise to any interest in a patent or design, the comptroller shall, on request and on proof of title to his satisfaction, cause notice of the interest to be entered in the prescribed manner in the register of patents or designs, as the case may be.

(3.) The person registered as the proprietor of a patent or design shall, subject to the provisions of this Act and to any rights appearing from the register to be vested in any other person, have power absolutely to assign, grant licences as to, or otherwise deal with, the patent or design and to give effectual receipts for any consideration for any such assignment, licence, or dealing: Provided that any equities in respect of the patent or design may be enforced in like manner as in respect of any other personal property.

72.—(1.) The court may, on the application in the prescribed manner of any person aggrieved by the non-insertion in or omission from the register of patents or designs of any entry, or by any entry made in either such register without sufficient cause, or by any entry wrongly remaining on either such register, or by an error or defect in any entry in either such register, make such order for making, expunging, or varying such entry as it may think fit.

(2.) The court may in any proceeding under this section decide any question that it may be necessary or expedient to decide in connection with the rectification of a register.

(3.) The prescribed notice of any application under this section shall be given to the comptroller, who shall have the right to appear and be heard thereon, and shall appear if so directed by the court.

(4.) Any order of the court rectifying a register shall direct that notice of the rectification be served on the comptroller in the prescribed manner, who shall upon the receipt of such notice rectify the register accordingly.

(*To be continued.*)

CAMPHOR IN INDIA.—In Southern India the Government is offering the fullest encouragement to planters to undertake the cultivation of camphor in the Nilgiris.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in the Separation of Zinc from its Ores or Compounds H. L. Sulman, 44, London Wall, London. British Patent, 21,672. October 1, 1906.

The inventor claims :—(1.) In the separation of zinc from its ores or compounds, converting the zinc into oxide, treating the product with a solution of sulphurous acid so as to obtain a solution of bisulphite of zinc and precipitating the zinc as insoluble monosulphite by the addition of zinc oxide to the solution. (2.) The process of separating zinc from its ores, which consists in roasting the ore to convert the zinc into zinc oxide and yield sulphurous acid, treating the product with a solution of sulphurous acid so as to obtain a solution of bisulphite of zinc, precipitating the zinc as monosulphite by the addition of zinc oxide to the solution, and calcining the monosulphite to yield zinc oxide and sulphurous acid, which is used repeatedly. (3.) The method of carrying into practice the process covered by the previous claims, in which the precipitation of the zinc monosulphite by means of zinc oxide is effected in a tube mill or other apparatus in which the mixture is subjected to attrition in order to prevent incrustation of the zinc oxide by the insoluble zinc monosulphite. (4.) The complete process for separating zinc from its ores, compounds and products, substantially as described.

Improvements in the Separation of Zinc from its Ores or Compounds. H. L. Sulman, 44, London Wall, London. British Patent, 22,534. October 11, 1906

This process is a variation of that described in Specification 21,672 of 1906. The claims are :—In the separation of zinc from its ores or compounds, converting the zinc into oxide, treating the product with a solution of sulphurous acid so as to obtain a solution of bisulphite of zinc and precipitating the zinc as insoluble monosulphite by passing a current of air through the solution. (2.) The process of separating zinc from its ores, which consists in roasting the ore, if necessary, to convert the zinc into zinc oxide and yield sulphurous acid, treating the product with a solution of sulphurous acid so as to obtain a solution of bisulphite of zinc, precipitating the zinc as monosulphite by passing a current of air through the solution, and calcining the monosulphite to yield zinc oxide and sulphurous acid, which is used repeatedly. (3.) The complete process for separating zinc from its ores, compounds and products, substantially as described.

Improvements in the Manufacture of Tanning Extracts and in Tanning. D. Stewart, 19, Ardross Street, Inverness. British Patent, 5,438. March 6, 1907.

The process consists in adding sulphite liquors from the manufacture of paper pulp, the ash of which contains not more than 6% of iron calculated as FeO, to tanning extracts or tannin-containing materials or to aqueous solutions of tannin-containing materials.

Improvements in Pulverising or Grinding Mills. J. W. Fuller, junr., Catasauqua, Lehigh Co., Pennsylvania, U.S.A. British Patent, 7,143. March 25, 1907.

This invention relates to pulverising or grinding mills of the type in which the finely divided material is carried through the mill by a current of air, the coarser material being separated therefrom by baffles, and led back to the grinding rolls.

An important feature of the invention is the provision of superposed rotating wings or blades in a suction chamber arranged at different angular positions with respect to each other, so as to lift the finely divided matter vertically from the grinding means and then force it transversely or radially from the suction chamber into the separating chamber. A further feature of the invention is the improved means provided for controlling flow of air through the apparatus.

Improvements in Lime Kilns. W. J. Efford, Hall Cottage, Wouldham, near Rochester, and E. H. Dabner, Scarborough Villa, Burham, Kent. British Patent, 9,553 April 24 1907.

The inventors claim :—(1.) A lime kiln having a flue round its crown and communicating with the interior of the kiln, the said flue opening at opposite ends into two flues common to a range of kilns, and opening into an uptake, each of the kilns having a vertical flue opening at its lower end into the ash-pit, and at its upper end into a flue communicating with one of the two above-mentioned flues, which are common to the range, all the flues and openings being provided with suitably placed dampers whereby the heated gases from a burning kiln or several burning kilns can be shunted into a drying kiln or several drying kilns. (2.) A lime kiln having at one end a chalk feeding hopper and shoot, and at the other end a fuel-supplying hopper and shoot.

Improved Process of Purifying the Gases from Pyrites-burners G. Eschellman, Chimischeski Perenlok Haus No 5 St. Petersburg, and Ges der Tentelewschen Chemischen Fabrik, Wasnessenski 6, St. Petersburg. British Patent, 12,213. May 27, 1907.

The inventors claim :—The process of purifying the gases from pyrites burners, characterised by the fact that the gases, after passage through dust-chambers and following through apparatus for indirect cooling, are caused to pass first in upward direction through a coke filter, the grains of which decrease in thickness from bottom to top, and subsequently in downward direction through a fine-grained coke-filter, and that the gases thus filtered are finally washed with a weak solution of an alkali hydrate or with a weak milk of an alkaline earth.

RUSSIAN MERCURY.—The quantity of mercury smelted in Russia for the first ten months of this year is reported by the *Torg. Prom. Gazeta* at 6,875 poods, against 10,949 poods in the corresponding period of last year. The same journal makes the announcement that in the Verchotursk district, on the Vagran Government estate, mercury deposits have been discovered.

SERIOUS EXPLOSION AT A POWDER WORKS.—On Thursday last two men were killed and much damage resulted through an explosion at the Worsborough Dale Powder Mills of Messrs. Kynoch, Limited, near Barnsley. The cause of the explosion is at present unknown.

AMALGAMATION IN THE COAL TRADE.—It is announced that the Ocean Coal Company and Messrs. Wilson, Sons and Co., a large firm of distributors at Cardiff, have agreed to amalgamate. It is stated that the capital in the concern will shortly amount to £3,500,000.

PLATINUM IN CANADA.—The platinum industry in British Columbia is reported to be making good progress. It is stated that a French company recently acquired considerable land in the platinum district, and are having this territory carefully examined by experts. Other companies have also secured ground, which is to be exploited.

Market Reports.

THE RUSSIAN CHEMICAL MARKETS.

The St. Petersburg chemical report of November 28 states that for the latter half of the month no particular change had to be noted in the prices of chemicals; several items show a rising tendency, however. Values were:—Nitric acid, 36° Bé., 3 roubles to 3r. 20c.; borax crystals, 4r. to 4r. 80c.; white lead, 5r. to 5r. 15c.; sulphate of aluminium (common), 65c. to 75c.; chloride of lime, 1r. 45c. to 1r. 60c.; red prussiate of potash, 30r.; salammoniac, 7r. 50c. to 7r. 80c.; potash (Saratoff), 2r. 75c. to 2r. 85c.; Chili saltpetre, 1r. 95c. to 2r.; ammoniacal soda, 1r. 35c. to 1r. 40c.; caustic soda, 2r. 65c.; muriatic acid (technical), 60c. to 70c.; tartaric acid, 24r. 50c. to 25r. 50c.; superphosphate, 10 to 17%, 65c. to 70c.; red lead, 4r. 85c. to 5r. 10c.; sulphur (in lumps), 1r. to 1r. 5c.; sulphuric acid, 66° Bé., 85c. to 95c.; bichromate of potash, 8r. 40c. to 8r. 50c.; bichromate of soda, 7r. 25c. to 7r. 50c.; ether (0.725), 8r. 50c. to 9r. 50c.; collodion, 4%, 13r. 50c. to 14r. 50c.; all per pood of 36 lbs.

The Moscow chemical market report of December 4 states that Batavian indigo is quoted at 100 roubles, and Bengal at 70r. to 85r.; sulphate of copper, 5r. 50c. to 5r. 75c.; Russian calcined soda, 1r. 20c. to 1r. 30c.; Russian caustic soda, 2r. 60c. to 2r. 75c.; lump sulphur, 1r. 15c. to 1r. 20c.; Chili saltpetre, 2r. 20c. to 2r. 25c.; gum tragacanth (selected), 45r. to 48r., firsts 41r. to 43r., and thirds 9r. to 12r.; American colophony, 3r.; Russian tannin, 32r. to 33r., in grains, and powder 22r. to 23r. 50c.; tartar emetic (Russian), 19r. to 20r. 80c.; citric acid, 39r. to 41r.; aniline oil, 14r. 75c. to 15r. 15c.; castor oil (technical), 7r. 70c. to 7r. 90c.; tartaric acid, 24r. to 24r. 50c.;

Digitized by Google

all per pood of 36 lbs. Cutch, light lumps, 4r. 40c. to 4r. 50c., and refined cubes, 5r. 70c. to 5r. 85c.

Advices from the Warsaw chemical market, dated November 29, state that the market there is without any substantial change. During the two past months the prices of wood spirit (95-96°) has fallen to 9r. 50c.; nitric acid, 36° Bé., is quoted 3r. 50c.; borax crystals, 4r. 90c.; white lead, 5r. 80c.; sulphate of aluminium, 1r. 20c.; chloride of lime, 1r. 50c.; red prussiate of potash, 32r.; sulphate of copper, 7r. 35c.; potash (Saratoff), 3r. 15c.; Chili saltpetre, 2r. 18c.; Russian turpentine, 4r. 25c.; ammonia soda, 1r. 50c.; caustic soda, 3r. 20c.; muriatic acid (technical), 76c.; tartaric acid, 28r.; citric acid, 47r.; red lead, 5r. 90c.; refined sulphur, 1r. 80c.; sulphuric acid, 66° Bé., 1r. 2c.; acetic acid, 8r. 40c.; bichromate of soda, 9r. 60c.—all per pood of 36 lbs.

THE INDIGO MARKET.

Messrs. Millward and Co. report as follows, under date December 11:—

A moderate business continues, at steady prices, chiefly for export. The home trade is very quiet, with consumers operating only to cover actual requirements, pending more definite news concerning the Calcutta auctions. The financial situation is also naturally deterring buyers for stock. At the same time, there are indications that a better demand will not long be delayed. No public sales have yet been held in Calcutta, the railway strike making a late start inevitable. Some transactions have taken place privately for early shipment at about Rs.5 above last season's rates. The larger proportion of medium qualities, especially of red kinds, should encourage a revived interest amongst home-trade buyers, and only moderate prices are needed to make things on this market more active. Guatemala continues scarce and dear. Java is in rather better supply, but is still relatively high in price. Kurpah prospects are not favourable, and the small stocks at present held should realise well. Deliveries from London, January-November, were 2,859 chests, against 3,139 chests last year. Stocks on December 5 were 2,106 chests and 135 serons, against 1,860 chests and 334 serons last year.

THE AMERICAN CHEMICAL MARKET.

(Rate of Exchange, $4.86\frac{1}{2} = £1.$)

NEW YORK, November 26, 1907.

Nitrate of soda is very dull at $2.35. to $2.40. per 100 lbs. Sulphate of ammonia is unchanged at $3.05. per 100 lbs. Grey muriate, for galvanising, is offered at 5¾c. to 6c., as to make. White electrical muriate is selling at 5¾c. to 6c. Lump sal ammoniac, good white seconds, is steady at 9¼c. per lb. Lump carbonate of ammonia is 7¾c. to 8c. Bleaching powders range from $1.15. to $1.25. Alkali is steady at 90c. per 100lbs., f.o.r. makers' works, for light, 58%, in bags, while caustic soda is dull at $2.10. per 100 lbs. Sulphate of copper may be had at 5¼c., although the Syndicate still quotes 5½c. per lb. White powdered arsenic is cheaper, at 6¼c. per lb., to arrive, and 6½c. per lb., for prompt. Red Saxony arsenic is firm at 7½c. per lb. Carbonate of potash, calcined, 80-85%, is 3¾c. to 4c.; hydrated, same test, is 4¾c. Caustic potash, 75%, is 4¼c. Chlorates of potash and soda are respectively 8¾c. to 8½c. per lb., f.o.r. makers' works. Bichromate of soda is 7¾c., and bichromate of potash 8¾c., freight paid to various points. Prussiate of potash is quite dull at 15½c., while soda remains fairly strong at 9c. to 9¼c. Oxalic acid is much cheaper on spot, sales having been made down to 6¾c. per lb.; the weakening influence seems to be the offers by a new American maker. Antimony compounds generally are firm, but dull. Naphthaline balls for next year are now being offered at $2.10. per 100 lbs., and flakes at $2.05.

TAR AND AMMONIA PRODUCTS.

Thursday.

Benzols quiet, with quotations given at 8¼d. to 8¾d. for 90's, and 8¼d. to 8½d. for 50-90's, casks included. Crude tar, 13s. 6d. to 17s. 6d. per ton, Thames; 1¼d. to 1¾d. per gallon, delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 23s. to 23s. 6d., f.o.b.; Gas Company, 25s.; East Coast, 21s. 3d. to 21s. 9d.; West Coast, 20s. 3d. to 21s. 3d., f.a.s. Refined naphthalene, £6. 10s. to £8. 10s., packages included. Toluol, 90%, 9¾d. to 10d.; pure, 1s. 1d., casks included. Carbolic acid, crude, 50%, 1s. 4d. to 1s. 5d.; 60%, 1s. 7d. to 1s. 8d.; Crystals, 39-40, 5d. to 5¼d.; 34-35, 4¾d. to 5d. Cresylic, 95%, 1s. 0½d. to 1s. 1d. Anthracene, 40 to 45%A, 1½d. to 1¾d., casks included. Pyridin, 4s. to 4s. 3d.

Sulphate of ammonia weak. Nearest values are:—Beckton, spot and forward, £12. 5s.; Beckton terms, £11. 15s. to £11. 10s. 3d.; London, £11. 15s.; Hull, £11. 16s. 3d. to £11. 17s. 6d.; Liverpool, £11. 17s. 6d. to £11. 18s. 9d.; Manchester, £11. 15s. to £11. 17s. 6d.; Leith, £12. 2s. 6d. to £12. 3s. 9d.

Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 6d.; Liverpool, ordinary, 11s. 1½d., and refined, 11s. 3d. Official quotations:—Cargoes off coast or due, 10s. 11d.

FERTILISER MATERIALS.

Thursday.

Little interest is shown in the purchase of manure material, manufacturers having for the most part covered their requirements, and, there being no relaxation of money stringency, there is no disposition to operate further.

Nitrate of soda is very quiet, and prices are easier, quotations being now 10s. 10½d. per cwt. for 95%, and 11s. 1½d. per cwt. for refined quality.

Some little business is reported done in East Indian bone meal from the quay, at £5. per ton, less 2½% discount. For shipment, however, £5. per ton, nett, c.i.f. terms, Liverpool, is required, but this price at present prohibits business altogether.

Mineral phosphates of all grades remain unchanged.

THE LONDON METAL MARKETS.

Wednesday.

Copper: Standard brands, £59. 5s. to £59. 10s. cash, and £60. 10s. to £60. 15s. for three months. Tin: G.M. quality, £125. 10s. to £126. cash, and £126. 10s. to £127. three months; English, £128; Banca, fl.78. Lead: Soft foreign, December, £14. 5s.; January, £14. 5s.; February-March, £14. 7s. 6d.; English, £14. 15s. Spelter: Ordinary brands, December, £20. 15s.; January, £20. 10s.; and March, £20. ex ship; hard, £17., f.o.b. Antimony, £33. to £35.; ore, £9. to £9. 10s. Bismuth, 6s. 6d. Quicksilver, £8. 5s.; seconds, £8. 3s. 9d. Nickel, 1s. 10d. per lb. Aluminium, £100. Wolfram, 23s. to 25s. Pig-iron closing prices. Cleveland, 49s. 1½d. cash; 48s. 7½d. one month; 48s. 3d. three months.

MISCELLANEOUS CHEMICAL MARKET.

Thursday.

Business, both for home and export account, is reported quiet generally, but upon the whole there is no indication of any weakness in the markets, and prices all round remain firm, both for spot and future deliveries. Sulphate of copper shows some slight variation in correspondence with the metal market, and latest quotations stand at £22. 5s., f.o.b. Bleaching powder is steady in price, at £4. 5s. to £4. 7s. 6d., f.o.b. Chlorates, 3½d. and usual conditions. Alkali, in bags, £4. 10s., f.o.r. Caustic soda, 70%, £10. 5s. per ton, f.o.b. Soda crystals, 57s. 6d. per ton, in bags. Saltcake is steady at 42s. 6d. per ton in bulk, carriage paid. Glauber salts, from 35s. to 37s. 6d. per ton, f.o.r. Sulphur is in steady demand, at £4. 17s. 6d. to £5., f.o.r. Acetate of lime is steady, at £11. 10s., c.i.f. for 80%. Acetic acid, 60%, £19. 10s., ex ship and for U.K. works. White sugar of lead, £28. 10s. Brown sugar of lead, £25. Acetate of soda, £17. 10s. White powdered arsenic, £27. to £28., according to brand. Green copperas very scarce and firm, at 40s., delivered. Muriate of ammonia steady, at £24. 10s. Prussiates are in fair demand, at 3¾d. and 5¾d. Potash, caustic and carbonate, continue in steady request, and prices remain firm.

LIVERPOOL OIL MARKET.

Thursday.

OILS.—Palm oil exceedingly steady; sales reported, including hard oils for December delivery, at £27. 5s., soft oils on spot at £28., and for December delivery £28. 5s., and Lagos, on spot, at £28. 10s. per ton, all in transit. Linseed oil quiet, at 23s. 9d. to 24s. 6d. per cwt. for Liverpool makes in export casks. Cotton-seed oil firm, at 24s. 6d. to 25s. 6d. per cwt. for Liverpool refined in export barrels. Tallow inactive. Turpentine in moderate demand, at 35s. 9d. per cwt. for spot parcels. Petroleum in moderate inquiry, at 7d. for Russian and Roumanian, and 7½d. to 8½d. per gallon for American refined oils. Petroleum spirit steady, at 1s. 0½d. to 1s. 3d. per gallon, with fair business passing.

Digitized by Google

LIVERPOOL DRYSALTERIES.

WEDNESDAY.

Dealings in Montreal potashes are limited, but with a firm tone prevailing, and quotations given at 36s. 9d. to 37s. per cwt. Pearl ash nominal in absence of stocks. Logwood in moderate demand, but little business is passing in fustic. Cutch steady. Castor oil dull, but steady at 3¾d. for first pressure French, 3⅝d. for good seconds Calcutta, 3½d. for second pressure French, and 3 7/16d. per lb. for first pressure Belgian. Calcutta forward parcels, December-January shipment, 3½d. per lb. Gambier: quay parcels offering at 21s. 6d., with store lots at 22s. to 22s. 6d.; October-November shipment, 20s. 3d.; November-December shipment, 19s. 6d.; and December-January shipment, 18s. 6d. Cubes, 29s. to 29s. 6d. per cwt., for store lots; October-November shipment, 28s.; and November-December and December-January shipment, 27s. 9d. per cwt. Shellac dull: Fair TN orange, on spot, quoted at 120s. to 122s. 6d., and January-February shipment, 119s. Glucose steady. American liquid, 43%, 11s. 9d. on spot, and 11s. 3d. for January-March delivery; and January-March shipment, 9s., c.i.f., for shipment. Chips, 80%, for shipment, 9s., and 70%, 9s., c.i.f. American powdered starch, 11s. on spot, and 10s. 6d., c.i.f., for shipment. Pearl, 10s. 7½d. on spot, and 10s., c.i.f. for shipment. Cream of tartar 98%, foreign powder, 87s.; 95%, 85s. Tartaric acid: English, 11d. to 11¼d. on spot, and foreign, 11d. Citric acid: English, 1s. 8d.; foreign, 1s. 8d.

TYNE CHEMICAL REPORT.

THURSDAY.

Market steady, with a fairly good demand for the period of the year. Caustic soda is firm at £10. 5s. per ton for 70%, and £11. per ton for 76-77%. Bleaching powder steady, at £5. to £5. 5s. per ton. Soda crystals, locally, £3. per ton. Sulphur scarce and firm, at £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton, nett; carbonate of alumina, £10. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—The coal market continues steady for prompt loading, and prices are well held with full loading terms to end of the month. To-day's quotations:—Best Northumbrian steam, 15s. to 16s. per ton; second qualities, 14s. to 14s. 6d. per ton; small steam coals, 8s. to 8s. 6d. per ton; best gas coals, 14s. to 15s. per ton; Durham bunker coals, 12s. 9d. to 13s. 6d. per ton; coking small coals, 12s. to 12s. 6d. per ton; household coals, 16s. to 17s. per ton; foundry coke, 19s. to 20s. per ton.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, WEDNESDAY.

Sulphate of ammonia has become still easier, and is indeed very idle for the moment. It is believed that as low as £12. has been taken for spot, f.o.b. Leith, but other makers, who are well sold forward, ask £12. 2s. 6d. Deferred delivery business is a blank, makers' quotations being much above the ideas of any possible buyers. Sulphate of copper has been unsettled and uncertain, but losing, if anything. In the ordinary chemicals, business has improved a little, inquiry both for prompt and forward being more in evidence. Values remain practically the same. The influence of the forthcoming holiday season will begin to make itself felt almost directly, in a general slowing down. Paraffins and mineral oils all remain very firm, and particularly in the delivery of burning oils, ex contracts, the daily movement is now considerable.

Chief prices current are:—Alum (in lump), £5. 5s. to £6. 5s., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 15s. to £5., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3¾d., nett, Glasgow; creosote (ordinary coal-tar and blast furnace), 2½d. to 3d., naked, f.a.s. Glasgow; nitrate of soda 11s. 1½d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2⅜d. to 2½d. per lb.; paraffin wax, 120°, semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 7d.; ordinary sorts, 6¾d. and 6½d. (for new spot business), at Glasgow and other big centres; ditto (lubricating) 865°, £6. to £6. 5s.; 885°, £6. 15s. to £7.; 890-895°, £7. 10s. to £8.; prussiate of potash, 5¾d. to 6d., nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £2. 17s. 6d. to £3.; sulphate of ammonia, £12. 2s. 6d. to £12. 3s. 9d, prompt, f.o.b. Leith; sulphate of copper, £22., less 5% Liverpool, prompt.

New Companies.

British Mexican Copper Syndicate, Ltd.—Capital £10,000., in 9,850 ordinary shares of £1. each and 3,000 founders' shares of 1s. each. This syndicate has been formed to carry on the business of copper and general miners, etc. No initial public issue. The subscribers are to appoint the first directors. Qualification, £100. Remuneration, 5% of the net profits, divided. Registered office, 55, Holborn Viaduct, E.C.

Cuzco Copper and Silver Co., Ltd.—Capital £3,000., in 2,925 preferred ordinary shares of £1. each and 3,000 deferred ordinary shares of 6d. each. This company has been formed to adopt an agreement with the Box Syndicate, Ltd., to acquire mineral and other properties in America and elsewhere. No initial public issue. The subscribers are to appoint the first directors. Qualification (except first directors, who require none), 100 shares. Remuneration, £100. each per annum (chairman, £150.) and a share in the profits. Registered office, 62, London Wall, E.C.

Dry Products Syndicate, Ltd.—Capital £15,000., in £1. shares. This company has been formed to adopt an agreement with the Central Egg Co., Ltd., J. Mecredy, and D. M. A. G. Hawes for the acquisition of certain interests in an invention for the reduction of liquids or semi-liquids to powder. No initial public issue. The first directors are J. E. Hubbard, W. Thornton, D. M. A. G. Hawes, and E. Yatman. Qualification, £250. Remuneration (except managing director) £100. each per annum, and 5% of the profits, divided.

Greek Iron Ore Corporation, Ltd.—Capital £120,000., in £1. shares. This company has been formed to acquire for £20,000., in shares, the benefit of agreements (1, 2, and 3) between G. Polygenis and P. Skinses, (4) between M. Stamatopoulos and the Societe Hellenique des Mines, (5) between A. Crokidas and A. C. Matsas, (6 and 7) between O. D. Stefanou and S. Desposito and L. Depian, and (8) between C. Scoumbourdi and A. Grigoriou and S. Desposito and L. Depian, so far as they relate to an iron mine in the Commune of Larymnos, Department of Phtiotide, Greece, and to carry on the business of iron and general miners, etc. Minimum cash subscription, 1,000 shares. The first directors are H. Verge, G. Chabert, W. Thiebaut and Baron J. de Catelin, all of Paris. Qualification, £250. Remuneration (except managing director) £400. per annum and 10% of the surplus net profits after 5% has been paid on the issued shares, divided. Registered office, 56, Cannon-street, E.C.

Liverpool Manganese Co., Ltd.—Capital £65,000., in £1. shares (5,000 preference). This company has been formed to acquire the interest of J. Washington and J. Irvine in certain manganese mines or land in Kilfaughnabeg, Co. Cork. No initial public issue. The first directors are to be appointed by the subscribers. Qualification, £250. Remuneration, £275. per annum and 7½% of any surplus profits after 10% is paid on the ordinary shares, divided.

Digitized by Google

Rebelj and Vis Copper Mines, Ltd.—Capital £25,000., in £1. shares. This company has been formed to acquire the benefit of a concession or lease granted by the Government of Servia to the Anglo-Servian Syndicate, comprising the Rebelj and Vis mines in the Canton and District of Veljewo, Servia, and to carry on the business of copper and general miners, prospectors, etc. No initial public issue. The first directors are J. J. Abell, R. T. B. Stewart, Chedo Mijatovich, General L. Lazarevitch, G. A. Howell, and A. D. M. Tucker. Qualification, £200. shares or stock.

Salis Syndicate, Ltd.—Capital £6,100., in £1. shares (6,000 "A" and 100 "B"). This company has been formed to promote or concur in promoting a company for the acquisition of the benefit of an invention or inventions relating to the purification of common rock salt, and various British and foreign patents and rights in connection therewith, to acquire and turn to account any beds, springs, or supplies of salt or brine, etc. No initial public issue. The subscribers are to appoint the first directors. Remuneration, two guineas each per board meeting attended. Each "A" share confers one vote, and each "B" share 20 votes. The "A" shares rank first for dividends up to an aggregate of £12. 10s. per share (in cash or in shares of the proposed company). Afterwards the "B" shares take all surplus profits.

LATE ADVERTISEMENTS.

A PRACTICAL Chemist with great experience in the development of new processes in the experimental stage, and a sound general knowledge of engineering, is open to appointment with enterprising firm.—Address, "No. 1,611," *Chemical Trade Journal* Office, 265, Strand, London, W.C.

MANAGER.—Smart business man, many years in Chemical trade, wants responsible position. Good all-round experience and excellent testimonials.—S., 30, Trent-road, Brixton Hill, S.W.

Notices.

All communications for the *Chemical Trade Journal* should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C.

Our Registered Telegraphic Addresses are:—

"Trepex, London."

"Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central.

Manchester: 3060.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*—payable in advance—including postage to any part of the world, are as follows:—

Yearly (52 numbers) ..... **12s. 6d.**

Half-Yearly (26 numbers) ..... **6s. 6d.**

Quarterly (13 numbers) ..... **3s. 6d.**

Back Numbers of the Journal.—In future all back numbers will be charged at 6d. per copy, plus postage.

Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To Be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

30 Words and under ..... 2s. 6d. per insertion
Each additional 6 words ..... 0s. 6d. ,,

Advertisements of Situations Wanted are inserted at the following rates when cash is sent with order:—

24 Words and under ..... 1s. 0d. per insertion
Each additional 6 words ..... 0s. 3d. ,,

Advertisers would oblige by writing advertisements and letters of instructions on separate sheets of paper.

Trade Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

Advertisements intended for insertion in the current week's issue should reach the office by **Thursday morning** at the latest.

THE RAILWAY PROBLEM.

THE important agreement between the Great Northern and Great Central Railway Companies which was formally announced on Saturday last marks a significant development in railway working, and as such it is of considerable interest to all manufacturers and traders. The virtual amalgamation of the two lines had been foreshadowed by Mr. Sam Fay, the General Manager of the Great Central Company, and its effect may be summarised in his statement that "when the arrangement is completed, it will be difficult to say where the Great Central terminates and the Great Northern commences."

The question of immediate interest to traders is the probable effect of such an arrangement so far as rates and efficiency of service are concerned. On this point the public has been assured by the officials that the development will be entirely in the direction of increased efficiency, and that the agreement has not been designed with a view to increasing freights. As to this we must wait developments, but in the meantime we may profitably glance at the reasons which have actuated the respective Boards in concluding this agreement. With regard to the estimates which have been current as to the great saving to be effected by the joint working of the two systems, it is pointed out by the *Manchester Guardian* that the amalgamation of the South Eastern and London, Chatham and Dover Companies, which came into effect in 1899, did not apparently have the effect of reducing the ratio of working expenses. Our contemporary proceeds to summarise the respective positions of the two great lines. Within the last few years the Great Central practically completed the ambitious scheme of extensions which have transformed it from a humble cross-country road into a great trunk line, running its own expresses from east to west and from north to south of England, and the Great Northern, the weakest of the old trunk lines, has begun to feel the competition of its enterprising neighbour and former ally very keenly. At the same time the Great Central, though gradually improving its position, has been groaning under the load of capital created to carry out its London extension. Moreover, the hand-to-mouth principle upon which it is compelled to conduct its finance is really costly, and the general interest charges, and charges for interest on Lloyd's bonds and the Railway Rolling Stock Trust, are now running at the rate of about £218,000. per annum.

The capital account of the Great Northern Co., although inflated by about £8,500,000. of nominal additions, is on a much sounder basis. The total expenditure works out at about £53,300. per mile, or £17,000. per mile less than on the Great Central, and the loan capital bears a much healthier ratio to the share capital. The general financial position of the Great Northern is also much more favourable than that of the Great Central. A comparison of the position of

Digitized by Google

the two companies as to gross receipts, working expenses, and net revenue shows that, while the Great Northern is in the better position to-day, the Great Central is rapidly overtaking it, and having greater undeveloped resources would in time probably attain results relatively much more favourable. Both lines, however, show a very heavy proportion of working expenses to gross receipts—higher than that of any of the other heavy lines—and there can be no doubt that this is partly due to the struggle which each has had to obtain or retain traffic in competition with the other. It seems, on the whole, that the Great Northern directors have done well for their shareholders in maintaining under the agreement almost the whole of the advantage which they hold at present, whilst the Great Central shareholders have lived so long upon hopes and prospects that they will probably not be indisposed to sacrifice some of their more remote possibilities in return for a somewhat larger share in the proceeds of the partnership than that to which their present position would entitle them. If the public interest is duly safeguarded, the agreement may turn out to be a good thing for all parties.

Besides the question of the probable result on public convenience and rates of freight, there must also be considered the significance of what is in effect an amalgamation of the two systems. We recently called attention to the conclusions on the railway problem which were enunciated by Lord Brassey at the Autumnal Meeting of the Association of Chambers of Commerce. In summing up the position, Lord Brassey emphasised the fact that the railway companies are hard pressed; that it is difficult to maintain dividends, even on a modest scale; that competition is severe between rival systems; and that in his opinion some measure of State ownership would be the outcome of any inquiry into the problem by a Royal Commission. The recent labour troubles in the railway world have only served to emphasise the justice of Lord Brassey's summing up of the problem, and we are quite in agreement with the opinion expressed by the *Manchester Guardian*, that while it is useless to speculate as to the precise effect of joint working in the case of the Great Northern and Great Central Companies, there is good reason to hope that it will be possible, without sacrificing public interests or general efficiency, to achieve substantial economies; and, further, that "all who look towards nationalisation as a future ideal in railway administration will watch with particular interest the development of a policy which in its practical application (although not, of course, in its intention or essence) has much in common with that of the management by a State Board of all the railways as a joint undertaking."

The Society of Motor Manufacturers and Traders, which is the official body of the motor industry in the United Kingdom, and which organises the Olympia Motor Exhibitions, is taking an important step for the development of the trade by the organisation of its *Trade Information Department*, so as to be capable of dealing promptly with any inquiries with regard to motor goods. It must often happen that the names and addresses of makers of certain classes of motor vehicles (especially for commercial purposes), or the makers of, or agents for, some particular type or brand of motor goods, are not known to those desiring to purchase or obtain particulars of same. In all such cases it is now only necessary for the inquirer to notify his requirements to the Society, Maxwell House, Arundel-street, Strand, London, W.C., when these will be circulated to the traders manufacturing or dealing in the articles in question.

THE LABOUR MARKET.

The Board of Trade *Labour Gazette* states that employment in November showed on the whole some decline, both as compared with the previous month and as compared with a year ago. In coal mining and in the textile trades generally employment remained good, and there was a seasonal improvement in the printing and bookbinding trades. In the building and shipbuilding industries it was bad. As compared with a year ago there was an improvement in employment in coal mining, and in most of the textile and clothing trades, and a decline in the metal, engineering, building, and furnishing and woodworking trades. In the 272 trade unions, with a net membership of 639,678, making returns, 32,010 (or 5.0%) were reported as unemployed at the end of November, 1907, as compared with 4.7% at the end of October, 1907, and 4.5% at the end of November, 1906.

Twenty-three new disputes began in November, as compared with 31 in the previous month, and 21 in November, 1906. The total number of workpeople affected by disputes which began or were in progress during November, 1907, was 13,210, or 7,056 less than in October, 1907, and 29,429 less than in November, 1906. The aggregate duration of all the disputes of the month, new and old, amounted to 227,400 working days, or 97,900 more than in October, 1907, and 290,400 less than in November, 1906. Definite results were reported in the case of 18 disputes, new and old, directly affecting 2,900 persons. Of these 18 disputes, 4 were decided in favour of the workpeople, 8 in favour of the employers, and 6 were compromised.

The changes reported in November affected 284,300 workpeople, of whom 280,800 received advances and 3,500 sustained decreases. The number whose wages were increased included 110,000 coal miners in Durham, and 165,000 in South Wales and Monmouthshire. The total computed effect of all the changes reported was a net advance of about £10,700. per week.

NITRATE OF SODA.

The labour troubles in Chili referred to in our last issue have quickly developed, strikes having occurred not only at most of the loading ports, but on the Pampa. The workmen not unreasonably demand compensation for the depreciation of the currency in which they are paid, and several thousands have marched down to Iquique from the works in Tarapaca, in order to submit their grievances to the authorities; operations have been suspended at some thirty oficinas, and troops have been despatched, the situation being considered critical. In the present temper of the men, excesses are to be feared, but a settlement should be arrived at at an early date unless market considerations, as on some previous occasions, weigh in the balance. In the meantime only 77,300 tons were cleared for Europe in the first half of this month, out of 208,000 tons loading at its commencement, and the December total will evidently be considerably short of the estimates; the quantity shipped by steamers (23,000 tons) was, however, as large as that in the whole of the month last year, and some of the boats chartered for the United States are not unlikely to be diverted to Europe on account of the American financial crisis. As we anticipated a week ago, holders of nitrate cargoes afloat are asking more money, and spot prices on the Continent are nominally harder, but buyers so far do not respond. The quotation for prompt shipment from Chili is again lower, at 8s. 1½d. per quintal, the disposal of the enormous accumulation of stocks having become a most serious problem.

Welsbach Incandescent Gas Light Co.—The directors have declared an interim dividend of 6% per annum for the half-year ending September 30.

THE LATE LORD KELVIN.

WE regret to record the death of Lord Kelvin, which took place on Tuesday last, at his Ayrshire residence, Netherhall, Largs.

The Right Hon. William Thomson, first Baron Kelvin, O.M., G.C.V.O., D.C.L., LL.D., F.R.S., was born at Belfast, on June 26, 1824. His father, James Thomson, LL.D., was Professor of Mathematics at the University of Glasgow, and made important contributions to mathematical science. His eldest brother, James, was Professor of Engineering at the same University.

William Thomson matriculated at the Glasgow University at the age of eleven. He remained for six years at the University, and although he never graduated there he distinguished himself by gaining many prizes in mathematics and natural philosophy, including the University prize for his essay on "The Figure of the Earth." In 1841 he entered Peterhouse College, Cambridge, where he graduated in 1845, when he was Second Wrangler and first Smith's Prizeman; this prize is the chief Cambridge distinction in experimental science. Immediately after graduating, he was elected a Fellow of his College. In 1842, at the age of 18, he published, in the *Cambridge and Dublin Mathematical Journal*, a series of remarkable papers, in which he foreshadowed many of the most important investigations of his later life.

After leaving Cambridge, Thomson went to Paris, where he worked in the laboratory of Regnault, and in 1846, at the age of 22, he was appointed Professor of Natural Philosophy at the Glasgow University. In that year also he became editor of the *Cambridge and Dublin Mathematical Journal*, and during the next seven years he collaborated with many of the mathematicians of the day, including Stokes, Cayley, De Morgan, Salmon, and Sir W. Rowan Hamilton.

At the meeting of the British Association in 1847, at Oxford, he made the acquaintance of Joule, of Manchester, who was then enunciating his dynamic theory of heat. This meeting was the beginning of a life-long friendship between the two great physicists, and resulted in the well-known joint researches of Joule and Thomson in thermo-dynamics.

Photo: London Stereoscopic Co., Ltd.

The personal and scientific qualities of the late Lord Kelvin cannot be better summarised than in the admirable appreciation, from the pen of Sir Oliver Lodge, which appears in the *Birmingham Daily Post*, and which we quote in full. Sir Oliver Lodge says:—"The simple lovable personality of Lord Kelvin was doubtless known to many, but only those engaged in scientific work could have any adequate idea of the immense amount of brilliant achievement which we owe to him, nor is it easy for the general public to realise the depth of the feeling with which he was regarded by his co-workers in physical science. The enthusiasm which he was able to throw into scientific problems was contagious, his presence at the reading of a paper, or a discussion, gave it at once a possibility of living interest, for if there was a germ of new truth or real value he was almost sure to ferret it out and exhibit it in its relation with other keenly apprehended facts and first-hand experiences in his unexampled store. Of second-hand or text-book information he was no great master, it was not in reading and cyclopædic knowledge that his greatness lay; it lay in his intense originality and vivid first-hand experience of physics or natural philosophy through more than half a century. Indeed, how much of that science is not due to him! Constantly, when lecturing to students, one has to quote, as the root or germ of whole departments of natural knowledge, some fruitful and epoch-making memoir of this great leader. *Facile princeps* in the world of physical science, the attitude of a scientific student to Kelvin is like the attitude of a citizen to Royalty; although to the outside public, ignorant as they are of science, chiefly by reason of the miserable system of secondary education which has too long survived, the name of some illustrious inventor like Edison may seem almost equally potent. The invention and bringing into use of many real conveniences is not a matter to be despised. Ingenuity and hard work are necessary to overcome the purely scientific difficulties; and afterwards much energy and a combination of qualities are necessary to overcome the inertia of officials and get them to realise the advantage it will be to them to change old ways for new. This, indeed, is often the hardest part of the work, and it is work at which Lord Kelvin's characteristic personal attributes made him very successful. Perhaps only two of those inventions appeal strongly to workers in pure science: one is the quadrant electrometer, the other is the receiving apparatus for ocean telegraphy. About the electrometer I will say no more here; it is so familiar an instrument that unless one has lived in the prehistoric period it is difficult to realise the step its introduction marked. But the telegraphic receiving instruments—the mirror galvanometer of 1857, and the siphon recorder and curb-key of later date—these represent to the physicist the outcome of a magnificent theory of cable telegraphy, wherein the problem of ocean signalling was worked out mathematically, amid the derision and unbelief, and of course total non-comprehension, of many self-styled practical men.

"But if these things were all that Lord Kelvin had done, he would not be revered as he is by the scientific world. Nor was it his teaching capacity that excited this feeling. He had, it is true, taught and "enthused" successive generations of senior students—not the general babel of undergraduates, but those fit though few who were worthy of their teacher; and he helped to bring into being that new weapon of instruction, the physical laboratory in all parts of the world. His pupils are to be found in the universities of America, of Australia, of India, and of Japan; indeed, every physicist on the planet is in a true sense his pupil. For now, at last, what is it that we really owe to his genius? Not this or that ingenious device or practical result, but new chapters of knowledge; whole departments of science start from his pioneering work.

"The modern theory of electricity, developed so brilliantly by Clerk Maxwell, was begun by him. The science of thermo-dynamics owes much to him; the theoretical laws of thermo-electricity were wholly worked out by him; and to him long ago was due the theory of those electric oscillations which were elaborated practically by Hertz, and have excited some popular interest as affording a method of wireless telegraphy. In the higher regions of optics also he worked much, and in his Baltimore Lectures and elsewhere strove to unveil the mystery of the

Digitized by Google

connection between ether and matter, as revealed in the facts of radiation, fluorescence, phosphorescence, selective absorption, and dispersion. The definition and the experimental determination of the absolute zero of temperature are both due to him. The vortex theory of matter constitutes one of his most brilliant but incompletely worked out speculations. The kinetic theory of its elasticity and rigidity is a definite contribution to that view of the physical universe which seeks to resolve the whole of merely material existence into the two fundamental entities—ether and motion. Let anyone ask what is the size of an atom, and he is referred to the work of Lord Kelvin. Let him ask what is the age of the earth: and if he mean anything definite by this question—if he mean, for instance, what time has elapsed since the earth was a molten mass beginning to cool, it is again to Lord Kelvin that he must go.

"And then the tides; all the higher mathematical work on the tides, with their various causes and perturbations, is based on Kelvin's pioneering work, and to him all writers on this abstruse subject look up and defer as their master. His tide-predicting machine is at work too, calculating automatically the future tides of the Indian Ocean, in a branch of our Nautical Office. Before he took his degree at Cambridge his name was known over Europe as that of a brilliant young mathematician; the beggarly elements learnt by schoolboys—trigonometry and the like—must have been familiar to him, under the instruction of his father, before the age of ten. Happy in the circumstances of his education, pertinacious in his unwearying industry, and undistracted by other interests from a constant devotion to definite dynamical science—narrow, perhaps, in some of its aspects, but all the more intense for that—he stands before us a monument of human power and influence, one of the benefactors of the human species, one who was happily preserved with hardly diminished energy for sixty years of peaceful epoch-making work, one on whom posterity will heap high honours and will regard with feelings of envy us of the recent generation who were illumined by his living presence."

Lord Kelvin's honours were many and varied. He was LL.D. of the Universities of Edinburgh, Cambridge, Dublin, Montreal, and Bologna; D.C.L. of Oxford, M.D. of Heidelberg, F.R.S., P.R.S.E., Foreign Associate of the French Academy of Sciences, a Grand Officer of the French Legion of Honour, Commander of the Belgian Order of Leopold and Knight of the German Order "Pour le Merite"; re-elected in 1872 a Fellow of St. Peter's College, Cambridge; three times President of the Royal Society of Edinburgh; from 1890 to 1895 President of the Royal Society, London; and in 1871, President of the British Association at its meeting in Edinburgh. In 1892 he was raised to the peerage, and assumed the title of Baron Kelvin, of Netherhall, Largs. The honouring of Lord Kelvin reached its culmination in 1896, when representatives of science and learning from the whole civilised world met at Glasgow to celebrate the jubilee of his professoriate.

We cannot more fittingly conclude this obituary notice of one of the greatest scientists of our day than by quoting a few of the handsome tributes which have been paid to his memory by our daily contemporaries.

In a leading article, the *Times* says:—"We announce, with profound regret, the death of Lord Kelvin, an event which will be deplored wherever science is honoured throughout the world. The universal regret will not be of the qualified kind that follows the departure of a great man who has outlived his faculties and become for the present generation *magni nominis umbra*. Notwithstanding his eighty-three years complete, Lord Kelvin remained an active thinker and worker, a force in the scientific world, and a referee for younger men in cases of doubt and difficulty. . . . It has been said that Velasquez is the painter of painters, and in the same sense it may be said that Lord Kelvin is the man of science of men of science. Only those who had climbed the minor peaks could fully appreciate the height of the pinnacle on which he stood. . . . Lord Kelvin's intellect was distinguished by range and flexibility, while his achievements are impressive by their variety and mass. . . . He was a daring and subtle theoriser; he was an eminently practical inventor; and he was a shrewd man of business. . . . When he said that all science is one science, he was saying the same thing as Carlyle, and he meant it in a wider sense than some readers may at first perceive. He did not merely mean that all the 'ologies' are subject to the same laws and must be consistent before they can be true, but also that they are all parts of the science of life, and are akin to the common observation of common things. . . . Finality is, indeed, the note of Lord Kelvin's achievements. He is not found advancing the solution of a problem by a stage and leaving it, his own initiative exhausted, to be carried forward by other men. When he is done with the matter there is no more to be done. The problem is solved, once and for all. . . . Lord Kelvin had in large measure the vitality, the elasticity, and the capacity for being acutely and vividly interested in the things about him, which keep the spirit young and enable a man to 'bear it out even to the edge of doom.' Yet, though in the best sense an optimist, full of faith in the possibilities of science, and keen to the last to grasp the bearing and promise of any new phenomenon, none knew better than he—it were to be wished that many of smaller attainments knew so well—the inexorable limitations. He was never of those who at each new discovery talk as if the last veil in the Temple of Isis were about to be torn asunder, disclosing the goddess in all her awful beauty. It needs the modesty of greatness to say after 55 years of strenuous and successful work—'I know no more of electric and magnetic force, or of the relations between ether, electricity, and ponderable matter, or of chemical affinity, than I knew and tried to teach my class students in my first session as professor.'

The *Birmingham Daily Post*, in an editorial reference, says:—'Lord Kelvin was a link with the early days of the nineteenth century, a period that witnessed many of the triumphs of modern thought. Essentially, a thinker rather than an appropriator or improver of the ideas of other men, William Thomson became one of the originating forces from which others drew their inspiration. A pioneer in various departments of research, an unwearied investigator of the secrets of Nature, a patient, humble-minded man who had the good fortune to receive during life acknowledgment of his surpassing merit, he has passed away as full of honours as of years. Lord Kelvin was one of those master-minds which arise for the illumination of mankind only at comparatively distant epochs. Had he lived in the infancy of science as we now know it he might have achieved discoveries worthy to rank with those of a Copernicus or a Newton. . . . Probably the most noticeable feature of his mental outfit was just that union of the imaginative with the hard practical mind which from time to time produces the magnificent intellectual dowries that stand as lighthouses down the ages. From the days of Lucretius to our own we find such occasional conjunctions playing great parts in the history of mind. . . . His practical nature was evidenced in a thousand ways, as the many patents standing in his name bear witness. Yet his innate modesty characterised the efforts of his long and amazingly fruitful career as failure. This in itself is a tribute to the greatness of the man. 'He knew this only, that he nothing knew.' Like Newton, with his simile of a child gathering pebbles by the sea-shore, Lord Kelvin's study of natural forces served to impress upon him the vastness of what remains to be known. That he was, in the words of Sir Oliver Lodge, a simple, lovable personality can after this readily be accepted."

The *Liverpool Daily Post and Mercury* observes—"Only a future age can rightly measure Kelvin's exact place among original investigators of scientific truth, but that place must necessarily be high. There was a touch of misunderstood poetic imagination about one of his utterances—many years ago—in which he suggested that life may have been conveyed to this planet by a

Digitized by Google

meteorite bearing its germs 'from the mossgrown ruins of some other world.' But at a gathering at University College four and a half years ago, he showed how firm was his belief in a creative power. Science, he then said, positively affirms creative power, and added, 'they only knew God in his works, but they were absolutely forced by science to admit and to believe with absolute confidence in a directive Power, in an influence other than physical, dynamical, electrical forces.' "

The *Manchester Guardian* says:—"Surely if any man was happy Lord Kelvin, who has just died, was. He has lived long; he had great genius; he used it to the full; he was not, like so many men of genius, baulked and tormented by poverty and the dulness of mankind; he did not, like many men of early-flowering mind, suffer from an early failure of zest or inspiration; his work was of that happiest and wholesomest kind which is neither wholly an affair of books nor wholly work of the hand, but compounded of both those ingredients; and its fruits, unlike the moralist's or statesman's, were those most satisfying fruits that you can touch and see, and that carry the glory of their production abroad on the binnacles of ships and along the routes of deep-sea cables. 'If you want to see his monument, look round you.' . . . Of his character no more fitting description can be given than that which FitzGerald wrote at Lord Kelvin's professorial jubilee in 1896: 'Enthusiastic for truth, sincere in all his dealings, sympathetic and helpful to all who are thrown in his way, fair and unprejudiced in his judgments of others, thoughtful and loving, his character is such that his disciples venerate and love as well as admire him, and the whole of science is better for such a leader.' "

THE CHINESE VEGETABLE OIL INDUSTRY.

AT Shanghai, at the end of 1906, there were three cottonseed mills at work, two of them fitted with American and one with mixed American and British machinery. Another is almost completed, and two others are in course of construction. A mill fitted to extract oil or fat from bones and to crush different kinds of beans and seeds is about to be inaugurated, also with American machinery, under foreign auspices. There is also a cotton seed oil mill at Tungchow, in the centre of the best cotton growing district. The Shanghai mills are supplied with seed from the interior as well as from the local ginning and cotton mills. The seed, which eleven years ago cost only 40c. per picul (133⅓ lbs.), has gradually risen in value to 1dol. 35c. per picul for white, and 1dol. 45c. per picul for black. The latter has a thinner pellicle, and contains more oil than the former. Kiangsu seed, especially Tungchow and Taitsang, is reputed the best, Chekiang seed having a thicker pellicle and less oil; but the percentage of oil differs with the dryness or dampness of the weather, and the following figures may be taken as approximately accurate:—

	Percentage.	
	Damp Season.	Dry Season.
Oil	12 ..	7
Cake	40 ..	32
Husk and refuse.. ..	48 ..	61

The seed, when it arrives at the mill, is roughly cleaned by being passed down inclined chutes with perforated bottoms, which allow the sand and dirt to escape, and at the ends of the chutes there are magnets arranged to catch nails and other pieces of iron with which the seed has been loaded. It is then passed through a cleaning machine, which removes the hairs and separates the seed from the pellicle. The hairs come out in a lap, and this cotton wool is sold locally to Japanese, who by means of primitive but ingenious wooden machinery convert it into yarn and twine for shop use. The cleaned seeds are then crushed, steamed, and the meal moulded on trays between layers of cloth, passed into the presses and crushed, about a minute elapsing between the crushing and the actual flow of oil, which gushes down into reservoirs built for its reception. From the reservoirs it is pumped into tanks, whence it runs into earthenware jars. In these jars it is purified by the addition of a quantity of baked and powdered oyster shells. The oil is sold locally as well as exported, most of the export going to Japan and Germany for use in the manufacture of soap; it is also used for cooking purposes and as an adulterant in bean oil, which is more expensive, the adulteration taking place in the retail shops. It is very difficult to get true prices in a country where fixed prices are the exception. At two mills visited recently, one gave 8dol., the other 8.50 taels per picul.

The customs abstract of statistics for 1906 lumps all vegetable oils together, and does not discriminate between the seeds producing them, but the Shanghai returns give 8,876 piculs of the value of 35,504 Haikuan taels as the export of cottonseed oil from that port to foreign countries, and 20 piculs as the export to other Chinese ports. The customs values are 4 Haikuan taels per picul, or about 4.50 Shanghai taels, a sum very much lower than any of the values given me at the mills.

In sympathy with the great increase in the export of oil seeds, seed cake advanced in weight from 851,291 cwts. in 1905 to 1,079,860 cwts. in 1906, and in value from £97,236. to £140,908. Nearly all goes to Japan.

Other seeds claiming attention are sesamum and rape. The export of the former almost doubled in 1906, and the demand, backed by an advance of 20% on ordinary prices, had to remain unsatisfied. This brisk demand was apparently due to a shortage in Indian supplies. In 1904 the export from India was 3,252,781 cwts.; in 1905 it was 1,964,029 cwts., and only 1,686,837 cwts. in 1906. China is quite capable of taking a larger share in this trade. Honan is the great centre of cultivation and production, and the peasantry must have blessed the Ching-Han (Peking-Hankow) Railway, which, traversing the province from north to south, enabled them to send their produce with all possible speed to a clamouring market at Hankow. The bulk of the seed was, however, from the harvest of 1905, for the heavy rains of 1906 proved disastrous to the crop. An unusually rainy season proves injurious to a province like Honan. As far as the eye can reach on both sides of the railway Honan is as flat as a table, with exceedingly few watercourses; in dry weather agriculture depends entirely on well irrigation, and in heavy rains there is no possible means of draining off the superfluous water, with the result that the crops are submerged and destroyed. At Hankow there are several seed-cleaning machines of British and German manufacture which give excellent results. The total export of sesamum seed in 1906 was 1,273,997 cwts., compared with 685,382 cwts. in 1905, and the value rose from £353,441. to £742,699. The seed finds its way for the most part to the Continent of Europe and Japan, and in 1906 one steamer carried away 5,000 tons from Hankow direct to Marseilles. Nearly all the rape seed, the export of which advanced from 23,513 cwts. in 1905 to 152,278 cwts. in 1906, goes to Japan. It was valued at £63,063.

The other seeds exported of any value are melon and apricot. The former goes to Hong-Kong, for re-entry into Southern China, and to Russian Pacific ports, where Russians and Chinese equally indulge in pine (*Pinus koraiensis*) and melon seeds. The apricot seeds, the bulk of which goes to Hong-Kong and Japan, are used mostly in confectionery. So plentiful as a rule is the fruit on the hills near Peking that it is allowed to drop from the trees, and the kernels afterwards collected and used for the production of apricot oil. In 1906 the value of melon and apricot seeds exported was £44,912. and £11,343. respectively.

LONDON NITRATE CO.—At the annual meeting of shareholders held in Liverpool recently, Mr. Frank Tobin, who presided, congratulated the shareholders upon an account showing the largest trading profit (£46,129.) the company had ever made. He referred also to the "find" which the company had met in its exploration of new property, which showed a deposit of nitrate estimated at ten million quintals. To work this the directors proposed to put up a new oficina, which would take some two years and cost about £85,000., and as the profits of the company were now about £4,000. a month the directors hoped to pay the cost mostly out of revenue. The report and accounts were adopted, and a final dividend of 10s. per share was declared, which, with the interim dividend of 5s. previously paid, made a total for the year of 15s. on shares of the nominal value of £5., with £2. 10s. paid up. At an extraordinary meeting immediately following a resolution previously passed in favour of a reduction of capital by the return of 10s. per share was confirmed. The shares of the company are also to be reduced in denomination from £5. to £2. The Chairman intimated that the proposals for reduction would have to be confirmed by the Courts, and that it would probably be four months before the shareholders received the 10s. per share.

PERSIAN IMPORTS AND EXPORTS.

THE following is a list of imports compiled by Consul W. F. Doty, of Tabriz, for 1905-06 :—

	1905	1906.
Gold, silver & platinum ..	450,787 ..	513,843
Matches	177,142 ..	291,773
Dyes	101,309 ..	192,691
Indigo	358,866 ..	154,865
Candles	90,637 ..	94,211
Copper and nickel ware ..	252,101 ..	44,076
The exports were :—		
Indiarubber, gums ..	996,470 ..	805,564
Dyes	93,517 ..	105,332

ENGLISH CROWN SPELTER CO., LTD.—An interim dividend of 6d. per £1. share for the year 1907 has been declared.

Continental Notes.

AT the beginning of the year, the *Zeitschrift für Chemische Apparatenkunde* offered prizes for the best papers on four different subjects :—(1) Apparatus for simple or fractional distillation in high vacuum. (2) Plant for the separation of liquids from solid substances suspended in them, for the purpose of separating the former or recovering of the latter (filtration). (3) Plant for stirring liquids with air. (4) On any subject connected with chemical plant. Two papers worthy of the prize of £15. were received under the fourth heading—one by K. Thelen, on the utilisation of heat in multiple effect evaporators ; and one by P. Spiess and A. Chatelan, on apparatus and process for the concentration of aqueous solutions. No papers of sufficient merit were received for the second and third subjects set, but for the first, E. Hausbrand submitted a communication on the steam consumption and number of plates in plant for the continuous distillation of alcohol, and parts of this paper are published in the issues for November 15 and December 1. The paper is largely mathematical in character. The concluding section has yet to appear ; when it has been published a brief account will be given of the conclusions arrived at.

The issues from October 1 to November 15 contain a paper on the calorimetric determination of the heating value of coal, with special reference to the standardisation of the calorimeter. The determination of the heat value of fuel is of great importance, not only in order to ensure the obtaining of good value for money, but also to ascertain whether the stoking of boiler furnaces is being performed in the best manner. The manipulation of a calorimeter requires, however, considerable skill and care, and the subsequent calculations are by no means simple, so that an inexperienced operator may easily obtain entirely false results. After the study of this paper by G. Jakob it should be possible to achieve accuracy.

In the issue of November 1 there is also a description of a resistance thermometer constructed of quartz glass. The advantage of a pyrometer that measures the temperature by the variation in the electrical resistance of a platinum wire is that the range over which it can be used is very extensive—from −200° to +900° C. For moderate temperatures up to +500°, mercury thermometers can be used, and for high ones up to 1,200°, thermo-couples upon the system of Le Chatelier can be employed, but in many cases it is more convenient to have one instrument that will cover the entire range. Hitherto, however, no satisfactory apparatus has been available, as the fireclay or other material used to support and protect the platinum resistance wire frequently failed, with the consequence that the instrument was damaged or destroyed. An instrument has now been introduced by Heræus in which the platinum is entirely embedded in quartz glass, and is thus fully protected against both chemical and mechanical influences. The wire is wound in a spiral round a quartz rod, and inserted into a narrow quartz tube, which is then fused together, so that the platinum lies close against the inner surface of the tube, and very rapidly acquires the correct temperature.

In this issue and that for November 15, R. Mewes writes on processes for the liquefaction of air and the separation of nitrogen and oxygen. He disputes the accuracy of Linde's theory of the liquefaction of air, and points out that no account has been taken of the cooling effect due to the mechanical work performed in driving the gases through the apparatus at a high speed. According to Pictet, the greatest quantity of liquid air that can theoretically be produced is 2.316 kg. per h.p. hour, but the greatest amount that has practically been made in the largest Linde machines is only ¼ kg. per h.p. hour. Mewes, however, claims to have devised a plant that will yield at least 1.6 kg.

Quartz glass may with advantage be applied, not only to resistance pyrometers, as above described, but also to thermo-couple pyrometers, as is pointed out by F. Hirschson in the *Zeitschrift f r Chemische Apparatenkunde*, for December 1. He states that the couple with platinum and an alloy of platinum with 10% rhodium can be used up to a temperature of 1,600° C., and where it is only required to measure temperatures up to 1,300° it is not necessary to make use of platinum. For the more moderate temperatures a couple of nickel and carbon can be employed, and this has the further advantage that the electromotive force produced is greater, and consequently the galvanometer does not need to be so very delicate. Where the temperatures are still more moderate the quartz sheath can also

Digitized by Google

be dispensed with, and one of iron used instead. The paper gives descriptions and illustrations of pyrometers on this system.

The same issue contains an article by J. Kunick, on a new machine for drying liquid substances. The liquid is caused to evaporate very rapidly upon the surface of a rotating drum, which is heated with steam. It is used almost exclusively for the drying of milk, for which it is specially suitable, as the milk powder produced is not burnt or overheated, and is readily soluble.

Reports of Companies.

ESPERANZA NITRATE CO.

The report for the year ended June 30 states that during nine months of the financial year no nitrate was produced, and no profit and loss statement is therefore presented. The construction of the maquina has occupied a much longer period than anticipated owing to the late delivery of materials and the shortage of labour. At June 30 last £36,087. had been spent on the new oficina and equipment. A considerable stock of caliche has been collected ready for treatment as soon as the new maquina comes into operation, and the cost of providing it, combined with the delay in resuming the production of nitrate, has materially increased the amount owing to the company's Valparaiso bankers. This item appears in the balance-sheet at £32,891.

ANGLO-CALIFORNIAN OIL SYNDICATE, LTD.

At the first annual meeting of shareholders the Chairman (Mr. Magnus Mowat), in moving the adoption of the report, said it contained a summary of the work they had done up to the date of its issue, November 23 last. From the balance sheet, which covered a period of twenty-two months, the shareholders would note that the capital account stood at £50,000., out of which the company had called up in round figures the sum of £39,800., leaving over £10,000. available for further operations. The calls in arrear had been reduced to a nominal figure. The property, including the cost of transfer, stood at £17,481. There had, he was pleased to say, been a considerable advance in oil-bearing properties since they secured their 1,500 acres. A sum of £2,454. had been spent in plant, machinery, buildings and other articles; £9,672. was represented by £4,961. spent upon well No. 1 and £3,065. upon well No. 2, and £1,641. would be apportioned between the two wells in later accounts. Judging from the indications of oil on their property and reviewing the situation as a whole the prospects, notwithstanding somewhat slow progress, were distinctly encouraging. From a commercial point of view oil fuel was assured. The output in California in 1905 was 35,000,000 barrels, and in 1906 it fell to 30,000,000 barrels, and that figure would probably not be reached this year. On the other hand the consumption had increased and was likely to go on increasing. The economic situation in California was satisfactory, the industry having got into strong hands. He moved the adoption of the report and accounts.

Mr. John Chapman seconded the motion, which was carried.

NOBEL-DYNAMITE TRUST.

An extraordinary general meeting of shareholders was held on the 6th inst. (Sir Ralph Anstruther presiding), for the purpose of confirming a resolution passed at a meeting of the company held on November 21 last. The Chairman proposed the resolution by which the holders of a 75% majority of the preference shares for the time being issued may consent to the creation or issue of any shares ranking equally therewith, and such resolution shall be binding upon all the holders of such preference shares.

Sir Richard Awdry seconded the resolution, which was unanimously agreed to.

FLORENCIA NITRATE COMPANY, LTD.

The report for the period ended March 31 states that the construction of the maquina was completed in April, 1906, when the production of nitrate of soda was commenced. After a successful working for three months the water supply gave out, and it was decided to shut down the works until the water system of the Antofagasta and Bolivia Railway Company, Ltd., was installed. The supply from this source is now in operation, and work was resumed in October last. An issue of second debentures to the amount of £30,000. was made in January, 1906, to meet the additional expenses incurred by the extraordinary delay in the erection of the plant, but it has been found necessary to increase this by a further £70,000., making a total issue of £100,000., the whole of which has been subscribed. It is proposed to extend the borrowing powers of the company, which are at present limited to £80,000.

PACIFIC NITRATE COMPANY, LTD.

The report for the year to June 30 states that the profit and loss account shows the London expenses from the inception of the company (June 21, 1905) to June 30, including office expenses and salaries, directors' fees, legal expenses, etc., less interest and discount and transfer fees, as £3,796., to which has been added:—Debenture interest from July 1, 1905, to June 30, 1907, £20,292., making a total of £24,089.; less profit on working oficinas, £12,180., leaving a debit balance to be carried forward of £11,908. The poor results shown are accounted for by the unavoidable delay in erecting the machinery owing to scarcity of labour and congestion in the port of Antofagasta. There have also been minor difficulties connected with the water supply and those incidental to the starting of new establishments. These the directors are informed by the coast agents are now being overcome.

KINTA TIN MINES, LTD.

The accounts for the year ended June 30 showed that 135½ tons of black tin, dressed and ready for sale, on the local market, have been produced by the monitors working on the company's land. The ore has been sold for £14,829., or an average of £109. 8s. 9d. per ton. The rent received for the monitors leased to the Chinese owner of the adjoining property was £9,640. The gross amount earned by the company during the period under review was £23,542. After deducting the expenses of working the property and its administration, both in the Federated Malay States and London, a net profit of £15,192. is shown. From this must be deducted £86. difference on exchange, £215. written off pipe line account, £144. loss on Consols sold, and £139. provision for income tax, leaving £14,607., and this, added to the £1,480. brought forward, gives £16,087. available for distribution. The directors have paid interim dividends amounting to 10%. The directors are entitled to a further remuneration amounting to £430., leaving £9,657. now to be dealt with. From this the directors recommend a further dividend of 2½%, making 12½% for the year, and that £8,157. be carried forward.

CASSEL CYANIDE CO., LTD.

The report states that the profit and loss account shows a credit balance of £48,879. Deducting the interim dividend of 10% paid in June, £8,812., there remains £40,066., which the directors recommend should be disposed of as follows, viz.:—To reserve fund, £10,000.; in payment of a further dividend of 20% (free of income tax), making 30% for the year, £17,625.; in payment of a bonus of 10% (free of income tax), £8,812.; carried forward to next year, £3,629.

INDIARUBBER, GUTTAPERCHA, AND TELEGRAPH WORKS.

Including £42,224. brought forward, the net profit for the past year amounted to £99,033. Final dividend, 15s. per share, making 10% for the year, carrying forward £49,033. The laying of a cable between New York and Havana, manufactured to the order of the Commercial Cable Company, has been completed since the closing of the financial year.

QUEENSLAND COPPER CO., LTD.

For the year ended July 31, 1907, the net profit is £36,142., to which has to be added £12,621. brought forward, making a total of £48,764. The following dividends have been declared:—Preference No. 6, payable February 13, 1907, 6%, £4,800.; ordinary No. 3, payable February 13, 1907, 3%, £4,005.; preference No. 7, payable May 15, 1907, 4%, £3,337.; ordinary No. 4, payable May 15, 1907, 5½%, £7,342. £29,278. carried forward (subject to directors' commission). Notwithstanding the heavy expenditure on capital account, the directors had until recently hoped to be able to recommend a further distribution at this time on account of the past financial year. That, however, is not now considered advisable, owing to the serious fall in copper. The dividends paid in respect of the year amount, however, to little more than half the profit earned.

THE NEW CUSTOMS TARIFF OF THE DOMINION OF NEW ZEALAND.

(*Continued from page 539.*)

SCHEDULE B.

Names of Articles.	Old Rates of Duty.		New Rates of Duty.	
	General Tariff.	Tariff on Goods the Produce or Manufacture of some part of the British Dominions.	General Tariff.	Tariff on Goods the Produce or Manufacture of some part of the British Dominions.
CLASS I. *Foods, etc.*				
Salt	Free.		Free.	
CLASS V. *Drugs, etc.*				
Acids, viz.: Boracic, carbolic, chromic, citric, fluoric, formic, lactic, muriatic, nitric, oleic, oxalic, picric, pyrogallic, salicylic, sulphuric	Citric, formic, and lactic acids not specially tariffed; others free.		Free.	
Dextrine, n.o.e.	15% ad val.		Free.	
Disinfectants	Free.		Free.	
Drugs and chemicals, *viz.*:—				
Carnauba wax				
Catechu				
Cochineal				
Creosote, *crude or commercial*				
Crude distillates of coal-tar or wood, in vessels containing 10 gallons or over, for the manufacture of disinfectants in New Zealand				
Formic aldehyde and solution thereof				
Fusel oil				
Gall nuts				
Glycerine, *crude*				
Gums, *viz*: Arabic, benzoin, damar, tragacanth, artificial gum-arabic				
Liquefied gases, and compressed gases				
Naphthalene, crude or refined				
Saffron				
Sulphur				
Turmeric				
Alum, alum sulphate				
Ammonium chloride, or salammoniac, ammonium sulphate				
Arsenic and arsenates	A few not tariffed, but mostly Free (including water hardening chemicals for brewers' use).			
Borax				
Calcium carbide, chloride, sulphate, sulphite, and bisulphite; chlorinated lime				
Carbon bisulphide				
Copper sulphate, or bluestone, oxide of copper				
Iron sulphates			Free.	
Magnesium sulphite and bisulphite				
Manganese oxides				
Phosphorus				
Potash; pearl ash; potash, caustic, chlorate, cyanide, nitrate (or saltpetre), permanganate, prussiates, sulphite and bisulphite; metallic potassium				
Salts of thorium, zirconium, or other rare metals, and solutions thereof, including mixtures of same suited for the manufacture of incandescent mantles				
Silver nitrate in crystals				
Soda acetate, *crude*; soda ash; soda, arseniate, anhydrous carbonate, caustic, cyanide, bisulphite, hyposulphite, silicate, sulphate, sulphide, sulphite, nitrate, permanganate				
Metallic sodium, sodium peroride				
Zinc chloride				
(Note.—It is provided in the new Tariff that mixtures of any of the articles enumerated under this Schedule as drugs and chemicals, with each other, or with chemicals, or substances not enumerated, shall, if not provided for elsewhere in the Tariff, be charged as medicinal preparations not otherwise enumerated, or chemicals not otherwise enumerated, under Schedule A, Class V				
Insecticides for agricultural uses, also tree washes	Free.

Powder, *viz* : Blasting powder, and blasting meal	Free.		Free.	

(*To be continued.*)

HENRITE EXPLOSIVES, LTD.—Registration has been made of a trust deed dated November 21, 1907, to secure £2,000. debenture stock, charged on leasehold land and buildings at Dartford, Kent, and the company's undertaking and other property ; including uncalled capital, but excluding patents.

ANGLO-GERMAN TRADE.—The Bill shortly to be introduced in the German Reichstag dealing with Anglo-German commercial relations gives extensive statistical tables showing the great increase in the exchange of goods between the two countries. Last year Germany imported from Great Britain goods to the value of £74,050,000., while her exports to Great Britain totalled £76,350,000. These figures include the raw products which Germany receives from British colonies. The German exports to England were valued at £53,350,000. The value of the whole volume of German trade with Great Britain reached £94,550,000. being an increase of £6,500,000. as compared with the previous year.

THE PRICE OF LEAD.—The *Manchester Guardian* observes that the fall in lead is assuming serious proportions. The market has steadily receded since November 1, when the price of English pig lead stood at £22. 2s. 6d. per ton. The cause of the rapid decline during a month when other metals have been fairly steady is somewhat obscure, and various theories have been put forward to account for it. It has been suggested that Stock Exchange influence has been brought to bear with a view to certain operations in shares, but it seems more likely that the real reason is the contraction of business generally following upon the American collapse. Lead at £22. per ton is as high, proportionally and in comparison with the normal values of a long series of years, as is copper at £100. The American trouble is the direct cause of the fall in copper prices of rather more than one-third, and it is easy to believe that the same influence has worked upon the lead market. From £15. to £16. per ton for lead is a fairly reasonable price in ordinary times.

THE NEW PATENTS ACT.

(*Continued from page* 541.)

Powers and Duties of Comptroller.

73.—Where any discretionary power is by or under this Act given to the comptroller, he shall not exercise that power adversely to the applicant for a patent, or for amendment of a specification, or for registration of a design, without (if so required within the prescribed time by the applicant) giving the applicant an opportunity of being heard.

74.—The comptroller may, in any case of doubt or difficulty arising in the administration of any of the provisions of this Act, apply to a law officer for directions in the matter

75.—The comptroller may refuse to grant a patent for an invention, or to register a design, of which the use would, in his opinion, be contrary to law or morality.

76.—The comptroller shall, before the first day of June in every year, cause a report respecting the execution by or under him of this Act to be laid before both House of Parliament, and therein shall include for the year to which the report relates all general rules made in that year under or for the purposes of this Act, and an account of all fees, salaries, and allowances, and other money received and paid under this Act.

Evidence, etc.

77.—(1.) Subject to rules under this Act in any proceeding under this Act before the comptroller the evidence shall be given by statutory declaration in the absence of directions to the contrary; but in any case in which the comptroller thinks it right so to do, he may take evidence viva voce in lieu of or in addition to evidence by declaration or allow any declarant to be cross-examined on his declaration. Any such statutory declaration may, in the case of an appeal, be used before the court in lieu of evidence by affidavit, but if so used shall have all the incidents and consequences of evidence by affidavit.

(2.) In case any part of the evidence is taken viva voce, the comptroller shall, in respect of requiring the attendance of witnesses and taking evidence on oath, be in the same position in all respects as an official referee of the Supreme Court.

78.—A certificate purporting to be under the hand of the comptroller as to any entry, matter, or thing which he is authorised by this Act, or any general rules made thereunder, to make or do, shall be prima facie evidence of the entry having been made, and of the contents thereof, and of the matter or thing having been done or left undone.

79.—Printed or written copies or extracts, purporting to be certified by the comptroller and sealed with the seal of the Patent Office, of or from patents, specifications, and other documents in the Patent Office, and of or from registers and other books kept there, shall be admitted in evidence in all courts in His Majesty's dominions, and in all proceedings, without further proof or production of the originals.

80.—(1.) Copies of all specifications, drawings, and amendments left at the Patent Office after the commencement of this Act, printed for and sealed with the seal of the Patent Office, shall be transmitted to the Edinburgh Museum of Science and Art, and to the Enrolments Office of the Chancery Division in Ireland, and to the Rolls Office in the Isle of Man, within twenty-one days after they have been accepted or allowed at the Patent Office.

(2.) Certified copies of or extracts from any such documents and of any documents so transmitted in pursuance of any enactment repealed by this Act, shall be given to any person on payment of the prescribed fee; and any such copy or extract shall be admitted in evidence in all courts in Scotland and Ireland and in the Isle of Man without further proof or production of the originals.

81.—Any application, notice, or other document authorised or required to be left, made, or given at the Patent Office or to the comptroller, or to any other person under this Act, may be sent by post.

82.—Where the last day fixed by this Act for doing anything under this Act falls on any day specified in rules under this Act as an excluded day, the rules may provide for the thing being done on the next following day not being an excluded day.

83.—(1.) If any person is, by reason of infancy, lunacy, or other disability, incapable of making any declaration or doing anything required or permitted by or under this Act, the guardian or committee (if any) of the person subject to the disability, or, if there be none, any person appointed by any court possessing jurisdiction in respect of his property, may make such declaration or a declaration as nearly corresponding thereto as circumstances permit, and do such thing in the name and on behalf of the person subject to the disability.

(2.) An appointment may be made by the court for the purposes of this section upon the petition of any person acting on behalf of the person subject to the disability or of any other person interested in the making of the declaration or the doing of the thing.

Register of Patent Agents.

84.—(1.) A person shall not be entitled to describe himself as a patent agent, whether by advertisement, by description on his place of business, by any document issued by him, or otherwise, unless he is registered as a patent agent in pursuance of this Act or an Act repealed by this Act.

(2.) Every person who proves to the satisfaction of the Board of Trade that prior to the twenty-fourth day of December, one thousand eight hundred and eighty-eight, he had been bona fide practising as a patent agent shall be entitled to be registered as a patent agent in pursuance of this Act.

(3.) If any person knowingly describes himself as a patent agent in contravention of this section he shall be liable on conviction under the Summary Jurisdiction Acts to a fine not exceeding twenty pounds.

(4.) In this section "patent agent" means exclusively an agent for obtaining patents in the United Kingdom.

(*To be continued.*)

THE LATE MR. SAMUEL HALL.

As briefly recorded in our last issue, Mr. Samuel Hall, F.I.C., F.C.S., treasurer of the Society of Chemical Industry, and chairman of the board of directors of Messrs. Edward Cook and Co., Ltd., Bow, E., died on the 9th inst. In an appreciation of the deceased gentleman, the *Chemist and Druggist* says:—"In the circles of chemical industry Mr. Hall was one of the most beloved of men, and his death breaks many friendships—international as well as Metropolitan and British. His was a remarkable life, and he started on his business career without any idea of becoming a chemist. He was born in Austin Friars' London, and after his elementary education at a private school in Brighton he became one of the earliest pupils of the City of London School. A few weeks ago, in conversation with him, he recalled the teaching of chemistry in the old school in Milk-street, Cheapside, when the teacher was the man who, in the case of many boys, paved the way for the more advanced instruction that Hofmann came to this country to give. Mr. Hall was fond of chemistry and science generally, but on leaving school, at fifteen (he finished at University College), he entered his father's business, which was that of Hall Brothers, hat manufacturers, Fore-street, and Frampton Cotterell. Three years later his father became blind, and the conduct of the whole business fell upon his son's shoulders. About 1870 he became a partner in the firm of Messrs. Edward Cook and Co. On entering the soap business, Mr. Hall, who had never lost grip of chemistry, studied the subject more intimately, so as to take charge of the chemical side of the business. Under his guidance this has developed steadily, and the works contain well-equipped experimental laboratories which he superintended. By his co-directors and the staff of the company Mr. Hall was regarded with deep respect, his kindliness and generous spirit being held in affectionate remembrance. He was one of the original members of the Society of Chemical Industry, and when his relative and co-partner, Mr. Edward Rider Cook, died in 1898, Mr. Hall was appointed to succeed him in the Hon. Treasurership, an office which has been associated with the Bow house since the foundation of the Society. Mr. Hall was an admirable treasurer, and spared no trouble in conserving the Society's interests in money matters, while he also attended with consistent regularity the meetings of the London Section."

Brazilian Manganese Corporation, Ltd.—Registration nas been made of the issue, on November 28, of £1,000. 6% debentures, part of series created September 30, 1907, to secure £80,000., charged on freehold manganese estate and business in the Fazenda de Campo Allegre, Minas Geraes, Brazil. No trustees. Previously issued of same series, £8,000.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in or relating to the Purifying of Waste Water. L. C. Girerd, M.D., and J. Drapier, both of 57, Rue d'Amsterdam, Paris. British Patent, 24,172. October 30, 1906.

This invention relates to the biological purification of waste waters, and consists (1) in distributing the waters in a divided condition and causing it to pass in an intermittent manner on to and through one or more beds or filters in free and direct contact with the air and charged with aerobian organisms, such bed or beds being disposed on a suspended hammock or hammocks formed of material allowing a relatively large circulation of air and consisting of granular and porous matters containing either peroxide of iron and magnetic oxide or baryta and manganese dioxide; (2) in apparatus for carrying out the treatment set forth above, and comprising one or more suspended completely perforated hammocks in direct contact with the air, supporting granular and porous materials constituting oxidising filters, the hammocks being surmounted by a closed tank constituting a disaggregating and a hydrolising chamber, terminating in a syphon with intermittent working, the discharge orifice or conduit of which is larger than the inlet conduit.

Improvements connected with the Manufacture of Fertilisers and other Useful Products from Animal Refuse and the like. A. J. Lehmann, 7, September Road, Liverpool. British Patent, 24,492. November 2, 1906.

The inventor claims:—(1.) The improvement connected with the manufacture of fertilisers or artificial manures or other useful products from animal refuse and the like, consisting in subjecting the fumes or vapours or gases coming from the boiling or drying, or boiling and drying chambers, in which the animal refuse or the like is being treated, to coke or the like saturated with creosote or similar substance, contained in a chamber, through or over which they are passed. (2.) In the manufacture of fertilisers or artificial manures, or other useful products from animal refuse and the like, wherein such materials are boiled and subsequently dried, conveying the fumes or vapours and gases given off from them in drying, over inclined plates or boards or the like in the upper part of the chamber in which such material is boiled, and thereby causing the fumes or vapours from the boiling to be conveyed into and mixed with the aforesaid vapours or gases coming from the drying; and delivering same together from the said boiling chamber. (3.) This apparatus or plant for manufacturing fertilisers, and other useful products from animal refuse and the like, particularly as set forth with reference to and shown in the drawing accompanying the specification.

Improvements in the Manufacture of Soap or Mixtures containing Soap The Karsam Soap Co., Limited, M. R. A. Samuel, and A. A. Lockwood, all of 12, Minories, London. British Patent, 24,822. November 5, 1906.

This invention consists in injecting a hydrocarbon oil in a finely divided or pulverised condition into a soap or a mixture containing soap, the oil during this process not being heated to such an extent that it appreciably volatilises.

A Combined Gas Producer and Ammonia or Equivalent Generator. Clarke Chapman and Co., Limited, and John Robson, both of Victoria Works, Gateshead British Patent, 342A. January 5, 1907.

This invention comprises, in a combined gas producer and ammonia generator or equivalent volatiliser having the producer within the generator and tubes in the generator for utilising the heat of exhaust gases from a gas engine, the construction wherein liquid is vaporised by elements in communication with the generator and mixed with air, the mixture being then passed below and through the generator grate, and the gas produced passing in contact with the vaporising elements, around the ammonia generator or volatiliser, and thence in contact with the conduit conducting the aforesaid mixture to the generator grate, and finally to the plant in which it has to be utilised.

Improvements in the Manufacture of Electrodes for Electrolytic Purposes. G. W. Johnson, 47, Lincolns Inn Fields, London (communicated by Chem. Fab. Griesheim Elektron, Frankfort-on-the-Maine, Germany). British Patent, 5,223. March 4, 1907.

This invention relates to the manufacture of electrodes for electrolytic purposes from molten magnetic oxide of iron or of molten ferric oxide Fe_2O_3 that has been converted into magnetic oxide Fe_3O_4. It has been found by the inventors that on melting magnetic, or other iron oxide an excess of iron protoxide is always obtained. The presence of this protoxide of iron greatly weakens the mechanical and chemical resistance of the iron oxide electrodes, which are otherwise eminently suitable for electrolytic purposes, the reason of this weakening action being that the protoxide does not crystallise uniformly with the magnetic oxide and renders the electrodes liable to crack. Besides this, it is not sufficiently resistant to chemical actions. In order to obviate this disadvantage, the inventors add to the melt in the melting vessel, finely pulverised ferric oxide Fe_2O_3, which combines with the protoxide present and forms magnetic iron oxide. The amount of pulverised iron oxide must be at least sufficient to convert the whole of the existing protoxide into magnetic iron oxide, but an excess is not objectionable, because it dissolves in the melt in a uniform manner and crystallises homogeneously. In lieu of iron oxide, other oxides which combine with iron protoxide, such, for instance, as

Digitized by Google

chromium sesquioxide, or manganese sesquioxide may be used. The homogeneous crystallising melt thus produced is poured into moulds closed at the bottom, which may be of the usual kind; the mass solidifies gradually from the outside towards the inside, so that a rigid layer is first formed at the exterior, and this layer increases gradually in thickness towards the centre. When this layer has become thick enough, the remainder of the fluid contents of the mould is returned to the melting vessel to be used for a new charge. The mould is then opened and the electrode, closed at its lower end, is removed and allowed to cool slowly. The cooled electrode is then, for the purpose of increasing its conductivity, provided on its inside with a coating or lining of metal, which may be applied by electro-deposition or otherwise, or a bar or other core, of good conducting metal, such, for instance, as copper, nickel or the like, may be introduced into the molten mass poured in the mould before solidification takes place, the bar or core forming one piece with the electrode when it solidifies.

Improvements in Electric Furnaces. H. Pauling, 81, Wilhelmstrasse, Gelsenkirchen IV., Westphalia. British Patent, 18,901. August 22, 1907.

The inventor claims:—(1.) In an apparatus for producing voltaic strong-current arcs, in combination, a magnet, one pole of which forms a receptacle open at one end, such receptacle enclosing the other pole of the said magnet with a clear space between them, and a pair of curved electrodes arranged within this space so that the second said pole is embraced by either of them, such electrodes diverging towards the open end of the first said pole. (2.) In an apparatus as defined in the preceding claim, the provision of means for blowing a current of gas through the space between the electrodes and in the direction of divergence thereof. (3.) An apparatus as defined in Claim (2) characterised by the feature that the said means for blowing a current of gas through the space between the electrodes is constituted by a pair of nose pipes, extending through the closed end of the first said pole, and lying on opposite sides of the second said pole.

Legal Intelligence.

HIGH COURT OF JUSTICE.

KING'S BENCH DIVISION.

(Before Mr. Justice Lawrence and a Special Jury.)

BRADFORD DYERS' ASSOCIATION *v.* HALL AND OTHERS.

On the 12th inst. this case came before Mr. Justice Lawrence and a special jury. It was an action brought by the plaintiffs for damages for alleged infraction of a covenant not to be engaged or concerned or interested in any business of a similar character to that which Mr. H. H. Hall sold to the plaintiffs within a certain distance of Bradford. The Association were represented by Mr. Rufus Isaacs, K.C., Mr. Eldon Bankes, K.C., and Mr. Norman Craig, and the defendants by Sir Edward Carson, K.C., and Mr. Holman Gregory.

A consultation between counsel and solicitors was held after the Judge took his seat on the bench, after which Mr. Rufus Isaacs said he was very much obliged to the Judge for the indulgence given. The result of it was that both time and expense would be saved. It was not necessary now that he should go into the details of the case. The plaintiffs had naturally been anxious to establish their position with regard to this matter and had been compelled to bring the action. Sir Edward Carson, who represented the defendants, had now agreed to judgment being entered for the plaintiffs for £1,000. damages, with costs of the action. These terms would be endorsed on the briefs, and therefore it would be unnecessary to trouble the Judge and the jury with the case.

Sir Edward Carson said it was quite true that the action was brought on a covenant by which one of the defendants agreed not to carry on a certain business, but he thought he ought to say that the term mentioned in the covenant had now expired, so that the only question which would have had to be tried in the case, had it gone on, would have been as to the damages incurred up to a certain time. He wanted to make that quite clear, as otherwise there might get an idea abroad that this gentleman was persisting in breaking a covenant which he had undertaken.

Mr. Isaacs: Oh, no. The covenant came to an end, I think, about the end of 1906. Your Lordship will enter judgment for the plaintiffs by consent, with £1,000. damages and costs of the action.

The Judge assented, and judgment was entered accordingly.

CHANCERY DIVISION.

(Before Mr. Justice Warrington.)

THE BRITISH LIQUID AIR CO. *v.* THE BRITISH OXYGEN CO.

In giving judgment in this case on the 3rd inst., His Lordship said:—The defendants had manufactured in Great Britain oxygen by a process protected by letters patent granted in 1895 and 1902, and the plaintiffs were proposing to manufacture oxygen in this country under a process covered by letters patent dated 1903 and 1905. The defendants alleged that the plaintiffs' process of manufacture would be an infringement of their patent of 1902, and they had, as they admitted, by advertisement, threatened the plaintiffs with the consequences of their proposed manufacture. The action was brought, therefore, to restrain such threats, and it involved the validity of the defendants' patents and of their alleged infringement by the plaintiffs. The position in that respect had been made quite clear by an agreement between the parties to deal with the matter as if the defendants had counterclaimed for an injunction to restrain the infringement of their patent by the plaintiffs. The issues with which he had to deal were precisely those raised in a patent action where validity was at issue as well as infringement. What was the true meaning of defendants' specification? The defect in the 1895 process, as used for producing oxygen commercially, was that the process was wholly evaporation. The purer the oxygen was, the smaller was the quantity got, and as pure oxygen was a very valuable commodity this was a serious defect. The patent of 1902 was to remedy that defect. He was of opinion that the true construction of that specification was that it was a claim for continuation. It was a claim for a rectifying column, but for a rectifying column in combination with other agents. The claim, therefore, must be construed as a narrow claim. So construed it was unnecessary to consider the various alleged anticipations which had been relied upon. If he had been able to give a wider construction to that specification, and to hold that it might either be a claim to the principle of rectification or a claim to the principle of rectification as applied generally to this particular subject-matter, he thought then he should have been bound to find that a wide claim of that nature would have been defeated by some of those matters which had been relied upon in anticipation—and particularly by the Canadian claim of Le Sueur. That brought him to the question whether the patent so construed would be infringed by the proposed manufacture by the plaintiffs. It was idle to say that the rectifying column in the plaintiffs' patent was the same or performed the same functions as the rectifying column in Lindé's. Though some parts of the plaintiffs' patent might be the same as Lindé, he must come to the conclusion that, as a whole, the plaintiffs' patent was not an infringement. The result, therefore, was that the plaintiffs were entitled to the injunction for which they asked.

Plaintiffs were awarded the costs of the action.

ALUMINIUM SHAVINGS.

(To the Editor of the Chemical Trade Journal.)

SIR,—We have heard that aluminium shavings are used for chemical trade purposes, and we should be obliged if you or any of your readers can tell us in what form they are used, and for what purpose. Under separate cover we send you a sample of zinc shavings, and understand that the aluminium is used after this form or in finer threads.—Yours, etc.,

ALUMINIUM.

FORWOOD MANGANESE CO., LTD.—Registration has been made of £25,000. 6% second debentures, created November 25, 1907, registered. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

ELECTROLYTIC ALKALI CO., LTD.—Registration has been made of the issue on November 14 of £200. and on November 25 of £500. debentures, part of series created on July 9, 1904, to secure £50,000., charged on the company's undertaking and property, including uncalled capital. Previously issued of same series, £33,100.

PATENT CARAMEL CO., LTD.—Capital £800., in £1. shares. This company has been formed to acquire the business carried on by J. W. Jarvis and C. H. K. Gonville, at Stratford, and to carry on the business of manufacturers of caramel and brewers' sundries, etc No initial public issue. Registered without articles of association. Registered office, Oxford Works, Oxford Road, Stratford, E.

GRAPPENHALL TANNING CO., LTD.—Capital £25,000., in £10. shares. This company has been formed to acquire the business lately carried on at Knutsford Road Tannery, Grappenhall, Cheshire, as Alfred Dakin and Co., and to carry on the business of tanners, skinners, curriers, leather dressers, hide and skin merchants, etc. No initial public issue. The subscribers are to appoint the first directors. Qualification, 50 ordinary shares.

NEW YORK PRICES CURRENT.

DEC. 3, 1907.

PREPARED FOR THIS JOURNAL BY MESSRS. STANLEY JORDAN AND CO., 100, WILLIAM-STREET, NEW YORK.

Market Reports

THE AMERICAN CHEMICAL MARKET.

(Rate of Exchange, $4.86½ = £1.)

NEW YORK, DECEMBER 3, 1907.

Nitrate of soda is offered at $2.35. for spot, and $2.37½. for shipments. Sulphate of ammonia ranges from $3.05. to $3.10. per 100 lbs. Grey muriate, for galvanising, is 5½c. to 6c. per lb., as to make, and white muriate is about the same. Lump sal ammoniac is 9½c. per lb. Carbonate of ammonia, lump, is steady at 7⅞c. to 8c. per lb. Bleaching powders are dull, and in rather plentiful supply at $1.15. to $1.25. per 100 lbs. Alkali is 90c. per 100lbs., f.o.r. makers' works, for light 58% in bags, and caustic, 74%, is $2.05. per 100 lbs. same conditions. Sulphate of copper is 5½c. per lb., for outside makes, although the Syndicate holds firm at 5½c. per lb. White powdered arsenic is very dull, and the price is purely nominal at 6½c. per lb. Red Saxony arsenic is steady, although slow, at 7½c. per lb. Carbonate of potash, 80-85% calcined, is 3⅞c. per lb.; hydrated, same test, is 4⅜c. Prussiate of soda and potash are respectively 9½c. and 15½c. per lb., with business slack. Chlorates are unchanged under Syndicate control, at 8½c. and 8¾c. per lb. for soda and potash, f.o.r. makers' works. Bichromate of potash is 8½c. per lb., and soda is weak at 7c. to 7½c. per lb. Phosphate of soda is dull, at $1.85. per 100 lbs. Oxalic acid is very weak, and is quoted at 6¾c. to 7c. per lb. for prompt shipment, while next year's delivery is nominally 7½c. per lb. During the past week the market has felt the full effect of the financial stringency, and business is almost at a standstill; monetary conditions, however, show a decided improvement.

THE RUSSIAN CHEMICAL MARKETS.

Advices from Riga, dated December 6, state that there has been a rather severe fall in the cost of sulphate of copper, resulting from the lower prices ruling for the metal. Citric acid, in sympathy with the movement of this product abroad, has risen in price. The following are the quotations ruling :—Nitric acid, 36° B., 3 roubles, 20-60 copecks; borax crystals, 4r. 45c. to 4r. 70c.; white lead, 4r. 80c. to 5r. 20c.; zinc white, 5r. 50c. to 6r.; sulphate of alumina, 70c. to 80c.; chloride of lime, 1r. 60-80c.; red prussiate of potash, 30r. to 32r.; yellow ditto, 13r. 25c. to 14r.; alum, 1r. 10-20c.; sulphate of copper, 6r. to 6r. 75c.; sal ammoniac, 7r. 80c. to 8r. 30c.; potash (Saratoff), 2r. 65c. to 3r.; Caucasian ditto, 2r. 90c. to 3r. 20c.; Chile saltpetre, 2r. to 2r. 10c.; Russian turpentine, 3r. to 3r. 30c.; ammonia-soda, 1r. 30r. to 50c.; caustic soda, 2r. 60c. to 2r. 75c.; muriatic acid, 45c. to 80c.; Berthellot salts, 9r. 60c. to 10r. 20c.; tartaric acid, 25r. to 26r.; citric acid, 54r. to 56r.; superphosphates, 13-14%, 52r. to 56r.; red lead, 4r. 60c. to 4r. 80c.; lump sulphur, 95c. to 1r. 10c.; sulphuric acid, 66° B., 80c. to 95c.; acetic acid, 80%, 7r. 30c. to 7r. 50c.; 60%, 4r. 50c. to 5r.; bichromate of potash, 8r. 50c. to 8r. 75c.; bichromate of soda, 7r. 50c. to 7r. 75c.; ether (0.725), 8r. 50c. to 9r. 50c.—all per pood of 36 lbs.

The Odessa chemical market report for December 7 states that the tone is flat, but with little movement in prices. Ammonia, in casks, is quoted 7 roubles, 10 copecks; white lead, 6r. 10c. to 6r. 25c.; water-glass, 65°, 1r. 25c. to 1r. 30c.; glycerine, 11r. 75c. to 12r. 25c.; wood spirit, 96°, 7r. 40c. to 7r. 60c.; chloride of lime, 1r. 95c. to 2r.; yellow prussiate of potash, 14r. 50c. to 15r.; sal ammoniac, 8r. 20c. to 8r. 40c.; Caucasian potash, 2r. 45c.; Chile saltpetre, in sacks, 2r. 10c. to 2r. 15c.; caustic soda, 2r. 80c. to 2r. 85c.; calcined soda, 56-58°, 1r. 35c. to 1r. 40c.; muriatic acid (technical), 1r. 5c.; citric acid, 41r.; tartaric acid (Odessa make), 23r. 50c. to 24r.; Russian turpentine, 3r. 25c.; refined sulphur, 1r. 30c. to 1r. 35c.; sulphuric acid, 66°, 1r. 25c.; acetic acid (80%), 8r. 25c. to 8r. 55c.; bichromate of potash, 8r. 75c. to 9r.; ether, 8r. 25c.; to 8r. 50c.; sulphate of copper, spot, 6r. 25c. to 6r. 40c.; and January-February delivery, 5r. 75c.—all per pood of 36 lbs.

TAR AND AMMONIA PRODUCTS.

Thursday.

Benzols: quotations given at 8¼d. to 8¾d. for 90's, and 8¼d. to 8½d. for 50-90's, casks included. Crude tar, 13s. 6d. to 17s. 6d. per ton, Thames; 1½d. to 1¾d. per gallon, delivered. Refined tar, 12s. per barrel; Gas Company, 12s. 6d. Pitch, 22s. to 22s. 6d., f.o.b.; Gas Company, 24s. 6d.; East Coast, 21s. to 21s. 6d.; West Coast, 20s. 6d. to 21s., f.a.s. Refined naphthalene, £6. 10s. to £8. 10s., packages included. Toluol, 90%, 9d. to 9½d.; pure, 1s. 1d., casks included. Carbolic acid, crude, 50%, 1s. 4d. to 1s. 5d.; 60%, 1s. 7d. to 1s. 7½d.; Crystals, 39-40, 4¾d. to 5d.; 34-35, 4½d. to 4¾d. Cresylic, 95%, 1s. 0½d. to 1s. 1d. Anthracene, 40 to 45%A, 1½d. to 1¾d., cask included. Pyridin, 3s. 3d. to 3s. 6d.

Sulphate of ammonia quiet. Nearest values are :—Beckton, spot and forward, £12. 2s. 6d. to £12. 5s.; Beckton terms, £11. 15s. to £11. 16s. 3d.; London, £11. 13s. 9d. to £11. 15s.; Hull, £11. 15s. to £11. 16s. 3d.; Liverpool, £11. 17s. 6d.; Manchester, £11. 15s.; Leith, £12. 2s. 6d. to £12. 3s. 9d.

Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 6d.; Liverpool, ordinary, 11s. 1½d., and refined, 11s. 3d.

THE LONDON METAL MARKETS.

Wednesday.

Copper: Standard brands, £57. 15s. to £58. cash, and £59. 5s. to £59. 10s. for three months. Tin: G.M. quality, £116. 10s. to £117. cash, and £118. 10s. to £119. three months; English, £120.; Banca, fl.71½. Lead: Soft foreign, prompt, £14.; January, £14. 2s. 6d.; February-March, £14. 5s.; English, or £14. 10s. Spelter: Ordinary brands, December, £20. 2s. 6d.; January, £19. 10s.; and February-March, £19. 7s. 6d., ex ship; hard, nominal, f.o.b. Antimony, £32. to £34.; crude, £22.; ore, £8. 10s. to £9. Bismuth, 6s. 6d. Quicksilver, £8. 5s.; seconds, £8. 3s. 9d. Nickel, 1s. 10d. per lb. Aluminium, £100. Wolfram, nominal, 25s. Pig-iron closing prices: Cleveland, 49s. 3d. cash; 48s. 4½d. one month; 47s. 6d. three months.

FERTILISER MATERIALS.

Thursday.

Quietness still prevails in all departments, there being no disposition on the part of manure manufacturers at present to buy further material.

Nitrate of soda is quiet, at 11s. 1½d. per cwt., for 95%, and 11s. 3d. per cwt. for refined quality.

East Indian bone meal, for shipment, is neglected, shippers demanding £5. per ton nett, c.i.f. terms, Liverpool, and from store, £5. 5s. to £5. 10s. per ton is required.

There is no change to report in mineral phosphates.

MISCELLANEOUS CHEMICAL MARKET.

Thursday.

There is no material change in the position of the markets, and business upon the whole is of a steady and uneventful kind. In the alkali trade there is a fair amount of inquiry, and some business is in progress for 1908 delivery; but there is somewhat of an inclination on the part of consumers to fix up their contracts for forward supplies. Values on the whole are very firm: sulphate of copper is rather in better request and firmer in price, at £22. 5s. to £22. 10s., f.o.b. for January and early spring delivery. Caustic soda and alkali, 58%, are without change. Bleaching powder is in fair request, and price £4. 5s. to £4. 7s. 6d., f.o.b. Saltcake is firm, at 42s. 6d. per ton, in bulk. For vitriol and muriatic acid the higher prices are being paid for 1908 delivery. Acetates and acetic acids are without change, and there is no indication of any further decline in values. Prussiates are steady at former quotations. Bichromates are somewhat unsteady, and tending towards lower prices. Arsenic is in very fair demand, at £26. to £27. for best Cornish makes, and £25. to £26. for other descriptions.

LIVERPOOL OIL MARKET.

Wednesday.

Palm oil dull, with small sales of Benin for Dec.-Jan. delivery at £27. 2s. 6d. and £27. 5s. on spot, and Lagos at £27. 15s. per ton, on spot, all in transit. Linseed oil steady, with quotations given at 23s. 6d. to 24s. per cwt., for Liverpool makes in export casks, according to quality, but little business is passing. Cottonseed oil in fair demand at 24s. to 25s. for Liverpool refined in export barrels. Tallow quiet. Turpentine quietly steady, at 35s. per cwt. for spot parcels. Petroleum: A fair business is being transacted in refined oils, with values given at 7d. for Russian and Roumanian, and 7½d. to 8½d. per gallon for American refined oils. Petroleum spirit steady at 1s. 0½d. to 1s. 3d. per gallon, according to grade, for American.

LIVERPOOL DRYSALTERIES.

Wednesday.

Montreal potashes quoted 36s. 9d. to 37s. per cwt., but in small demand. Pearl ash nominal. Logwood steady, but with moderate inquiry experienced. Fustic dull. Cutch in moderate demand, but holders remain steady. Gambier very quiet, with quay parcels offered at 20s, store parcels 20s. 6d., November-December shipment 19s. 3d., December-January 18s. and January-March, 17s. 9d. per cwt., with little doing. Cubes: Small sales are passing in the recent arrivals at 28s., ex quay, for No. 1 quality; store parcels are quoted at 28s. 6d. to 29s. according to quantity, with November-December shipment at 27s. 6d., and December-January shipment at 27s. 3d. per cwt. Gum Arabic quiet, with little business reported. Castor oil steady; values given at 3¾d. for first pressure French, 3½d. for second pressure French, 3 7/16d. for first pressure Belgian, and 3 5/16d. per lb. for good seconds Calcutta, ex quay and in store; Calcutta, December to May shipment, quoted at 3⅜d. per lb., but no sales are reported. Shellac quiet, and little business is passing. Quotations are given at 117s. for March delivery fair T.N. orange, and 118s. for May; for arrival, January-March, 116s., c.i.f.; spot quotation for fair free T.N. orange, 120s. Glucose steady: American liquid, 43%, on spot, 11s. 9d.; January-March delivery, 11s. 3d.; for January-March shipment, 9s., c.i.f.; Union Jack crystal, January-March delivery, 11s. 3d., ex works, London; chips, 80%, for shipment, 9s., and 70%, 9s., c.i.f. American powdered starch, 11s. on spot, and

Digitized by Google

10s. 6d., c.i.f., for shipment; pearl, 10s. 7½d., on spot, and 10s., c.i.f., for shipment. Cream of tartar, 98% foreign powder, 87s.; 95%, 85s. Tartaric acid: English, 11½d. on spot, and foreign, 11d. Citric acid: English, 1s. 8d.; foreign, 1s. 8d.

HULL PAINT, OIL, AND COLOUR REPORT.

WEDNESDAY.

OILS.—Markets during the week have been slack and continue so, having lost value from 5s. to 10s. per ton on the week, both for linseed and cottonseed oils. Demand generally is quiet in anticipation of holidays. Amongst the principal imports here to date, as against a year ago, are:—Wheat, 3,997,930 qrs., against 3,751,621 qrs.; flour, 207,331 cwts., against 344,210 cwts.; linseed, 794,833 qrs., against 549,915 qrs.; cottonseed, Egyptian, 185,226 tons, against 163,690 tons, other kinds 152,643 tons, against 113,643 tons; oilcake, 26,015 tons, against 41,671 tons; rapeseed, 102,369 qrs., against 127,486 qrs.; olive oil, 3,819 tuns, against 3,632 tuns; hemp, 132,487 cwts., against 156,847 cwts.; tar, 14,909 barrels against 13,541 barrels. Amongst the weekly imports:—Butter 8,193 cwts.; lard, 373 cwts.; margarine, 2,098 cwts.; sugar, 33,409 cwts.; hides, 1,375 cwts.; pig-iron, 952 tons; oilcake, 1,329 tons; colours, 1,814 packages; wool, 346,017 lbs.; hemp, 3,301 cwts. Exports:—Oil, 10,121 cwts.; colours, 2,941 packages; chemicals, 2,419 packages. Refined cotton oil quiet, 20s. 6d. naked, January-April 21s. 1½d. May-August 22s.; barrels £1. 10s., and casks £1. per ton extra. Exports during the week have been:—76 tons Belgium, 89 France, 82 Germany, 104 Holland, 1 Norway, 12 Sweden; total, 364 tons. Linseed oil, naked, spot 21s. 7½d., January-April 20s. 6d., May-August 19s. 6d.; boiled and refined, £1. to £1. 10s. per ton extra. Exports during the week have been:—7 tons France, 2 Germany, 2 Holland, 7 Norway; total, 18 tons. Cottonseed lower, spot and afloat, £6. 8s. 9d. accepted; January £6. 12s. 6d., £6. 11s. 3d accepted, and further buyers thereat; February-March sold at £6. 17s. 6d., Bombay; December-January, £5. 12s. 6d. buyers. Linseed, La Plata, spot, 43s. 9d.; December, 40s 6d.; December-January, sold at 39s.; January-February sold 38s. 9d. down to 38s. 6d.; February-March, 38s. 6d.; March-April, 38s. 6d., sellers. Turpentine lower, American 34s. 6d.; January-April, 35s. 6d.; May-June, 35s. 9d.; Russian, 18s. Rosins from 9s. 6d. upwards. Olive oil, £41. to £42. per tun. Rape oil, Ravison, December-January, 32s. 6d. Castor oil, prompt, for first pressings, 30s. 3d.; January-June, 29s. 6d.; July-December, 29s. 5d.; seconds, £1. per ton lower. Cod oil, £16. to £19. per ton.

TYNE CHEMICAL REPORT.

WEDNESDAY.

Market unchanged. Soda crystals in quiet demand, at £2. 17s. 6d. to £3. 2s. 6d. per ton, gross weights, for prompt. Caustic soda in good request, at £10. 5s. for 70%, and £11. per ton for 76-77%. Bleaching powder scarce and firm, at £5. to £5. 5s. per ton. Sulphur steady at £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £7. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—Market generally is easier, though for prompt a steady business is passing. Lower prices are anticipated for forward delivery. To-day's quotations:—Best Northumbrian steam, 14s. to 15s. per ton; second qualities, 13s. to 14s. per ton; small steam coals, 7s. 6d. to 8s. per ton; best gas coals, 14s. 6d. to 15s. per ton; Durham bunkers, 12s. 6d. to 13s. 3d. per ton coking small coals, 12s. to 12s. 6d. per ton; household coals, 16s. to 17s. per ton; foundry coke, 18s. to 20s. per ton.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, THURSDAY.

There is considerable movement in sulphate of ammonia in the way of deliveries under contracts, but new spot business makes a very poor show, while new forward dealing is non-existent for the time. The price for spot f.o.b. Leith is about £12., but there is nothing like life either in buying or selling, and the measure of new prompt business is small. In the ordinary heavy chemicals the movement has been fairly good, at about recent values, but things will now quieten down and remain so till over the New Year holiday stoppage. In the mineral oil and paraffin section the main feature is the heavy and increasing delivery of burning oil ex contracts, accompanied by some new spot business at the farthing a gallon advance. Lubricants and solid paraffins all firm.

Chief prices current are:—Alum (in lump), £5. 5s. to £6. 5s., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks, £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 15s. to £5., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3¾d., nett, Glasgow; creosote (ordinary coal-tar and blast furnace), 2¾d. to 3d., naked, f.a.s. Glasgow; nitrate of soda 11s. 3d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2¾d. to 2½d. per lb.; paraffin wax, 120°, semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 7d.; ordinary sorts, 6¾d. and 6½d. (for new spot business), at Glasgow and other big centres; ditto (lubricating) 865°, £6. to £6. 5s.; 885°, £6. 15s. to £7.; 890-895°, £7. 10s. to £8.; prussiate of potash, 5¾d. to 6d., nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £2. 17s. 6d. to £3.; sulphate of ammonia, £12. to £12. 1s. 3d. prompt, f.o.b. Leith; sulphate of copper, £22., less 5% Liverpool, prompt.

New Companies.

Anglo-Sumatra Rubber Co., Ltd.—Capital £90,000., in £1. shares. This company has been formed to purchase the leases or land concessions of the estates and properties known as Greaham and Bander Maria, in Serdang, East Coast of Sumatra, together with the coffee and rubber enterprises now carried on there, and to carry on the business of planting and cultivating rubber, guttapercha, coffee, and crops of any description. The first directors are W. Thorburn, J. Cargill, C. Meikle, H. Boyd, F. C. Bishop, and A. Gray Muir. Qualification, 250 shares. Remuneration, £350. per annum, divided.

Caledonian Petroleum Syndicate, Ltd.—Capital £40,000., in £1. shares. This company has been formed to acquire and work bituminous, oil and other properties, etc. J. Sinclair is one of the first directors. Qualification, 200 shares. Remuneration, £30. each per annum. Registered office, 173, St. Vincent-street, Glasgow.

Franco-Belgian Cotton Fibre Syndicate, Ltd.—Capital £7,750., in 5,000 ordinary shares of £1. each and 55,000 deferred shares of 1s. each. This company has been formed to carry on the business of obtaining fibre and husks from decorticated cotton seed hulls or otherwise, of spinning, manufacturing, preparing, dyeing, or dealing in cotton or other fibrous substances, of selling cotton fibre, husks, yarn and manufactured fibrous products, etc., and to erect, lease, or otherwise acquire any mills, works and machinery in France, Belgium, or elsewhere, etc. No initial public issue. LATE ADVERTISEMENTS.

CHEMICAL and Home Plumber with splendid business desires Partner with small capital Every inquiry solicited.—Address, "152," *Chemical Trade Journal* Office, 265, Strand, London, W.C

YOUNG Traveller for London Wanted. Undoubted references and connection among the largest wholesale Druggists and Grocers Baking Powder, Sauce, Pickle Manufacturers, absolutely essential. Must state salary—Apply, "1,649," *Chemical Trade Journal* Office, 265, Strand, London, W.C

Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C.

Our Registered Telegraphic Addresses are:—

"Trepex, London."

"Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central.

Manchester: 3060.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*—payable in advance—including postage to any part of the world, are as follows:—

Yearly (52 numbers) ..... **12s. 6d.**

Half-Yearly (26 numbers) ..... **6s. 6d.**

Quarterly (13 numbers) ..... **3s. 6d.**

Back Numbers of the Journal.—In future all back numbers will be charged at 6d. per copy, plus postage.

Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To Be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

30 Words and under ..... 2s. 6d. per insertion.
Each additional 6 words ..... 0s. 6d. "

Advertisements of Situations Wanted are inserted on the following rates when cash is sent with order:—

24 Words and under ..... 1s. 0d. per insertion.
Each additional 6 words ..... 0s. 3d. "

Advertisers would oblige by writing advertisements and letters of instructions on separate sheets of paper.

Trade Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

CURRENT TOPICS.

BANKERS AND THE GOLD RESERVES.

IN a recent lecture before the Liverpool and District Bankers' Institute, on "The Depreciation of Securities in Relation to Gold," Mr. E. H. Holden, M.P., pointed out that bankers had, in consequence of the depreciation of securities, suffered greatly, but had shown a praiseworthy example by persistently writing these down in their balance-sheets to their market value. Speaking generally, and regarding the whole of the banks as one bank, the loans created the credits, with the exception of the gold that came into the country. "Taking this into consideration," said Mr. Holden, "every banker must make up his mind by what amount his credits are liable to be diminished, both in ordinary and extraordinary times. He should then keep that amount of available resource in gold, or in a means of obtaining the same."

Mr. Holden proceeded to deal with three classes of loans—commercial, international, and Stock Exchange. The first-named had increased rapidly during the last few years, and the increase had been much larger in countries with high tariffs, because high tariffs meant high prices, and in consequence of this large profits, large extensions, and a large increase of loans. That this was so had been proved by Lancashire, America, and Germany.

As regards international loans, almost all imports and exports were financed on borrowed resources. The foreign bill really effected a loan. The lecturer showed that according to Sauerbeck's numbers in 1895 food was presented by 63.8, while in 1907 it was represented by 72.2, and that materials were represented by 57 in 1895, while in 1907 they were represented by 84.1. Having given figures showing the increase in imports and exports between 1900 and 1906 of the United Kingdom, Germany, France, the United States, Canada, Belgium, and Holland, he said it might be assumed that the international loans of these countries had increased approximately £843,000,000. To carry all the loans of these countries the amount of gold in their national banks amounted, in 1900, to £288,000,000., and in 1906 to £366,000,000., an increase of £78,000,000. If these figures were regarded from the point of view as to what amount of loans ought to be carried on £288,000,000., and £366,000,000. of gold, taking the ratio at 15%, the former would carry £1,920,000,000., and the latter would carry £2,440,000,000. The increase of loans should, therefore, be £520,000,000., whereas they had increased £843,000,000.

As to Stock Exchange loans there had, of recent years, been an enormous increase of new issues of this class of security, and the increased prices of commodities and Stock Exchange securities were largely due to the increase of loans in America and Europe. A fall in prices had resulted in consequence of the curtailing of Stock Exchange loans,

Digitized by Google

due to the excessive over-lending throughout the U.S.A.; when such a fall took place, investors sold, margins ran off, and brokers called for borrowers to take up their securities. Many were unable to do so, and the result was a general stampede and falling-off in prices.

Summing up his arguments, Mr. Holden said, "I have shown the appreciation and depreciation of American securities to be due to the increase and contraction of the loans. I have further shown that the depreciation of gilt-edged securities is due to the fall in the Bank of England reserves. If, then, we increase the actual available gold reserve from £15,000,000. in the Banking Department and £17,000,000. in the Issue department to £44,000,000. in the combined Department, we obtain a gold ratio of 55% as against a gold ratio of the Bank of France of 49%. The increased reserve would cause an appreciation in securities and a decrease in the bank rates. It has been urged that the expense of £275,000. per annum which would be incurred by the country in the repayment of the debt is too great, but the cost of this is infinitesimal compared with the loss sustained by the public through the depreciation of securities and the tax imposed on the trade and commerce of the country by the high rates of discount consequent on the low reserve. Touching the joint-stock banks, there can be no doubt that it is their duty to increase their gold reserves, and I think it is well known they are doing this, but I should like to suggest that the Board of Trade ask all bankers to supply them with balance-sheets, showing the amount of specie, Bank of England notes, balances with other banks, and balances at Bank of England which compose their reserves, and that the Board of Trade should issue a return showing these and other items of the balance-sheets in totals. If this be done, I venture to predict that the gold reserves would silently but effectively be increased."

CONCILIATION IN LABOUR DISPUTES.

In a recent issue we referred to the successful intervention by the President of the Board of Trade in the railway and cotton trade labour disputes. In this connection a recently issued report on the Rules of Voluntary Conciliation and Arbitration Boards and Joint Committees of the United Kingdom is of special interest. The formation, financial arrangements, methods of procedure, prevention of the stoppage of work, and the machinery provided to finally dispose of questions when Boards or Committees are unable to arrive at a satisfactory understanding, are all set forth. In an appendix to the report the various conciliatory agencies are classified with the methods adopted, such as a reference to the Board of Trade, or by submitting to the decision of a permanent neutral chairman.

The number of Boards and Committees engaged in settling disputes existing in various trades at the present moment is 194; and the number of workpeople involved in the disputes is calculated to be at least 1,250,000.

Almost invariably, friendly discussion between the respective representatives of the employers and employees of the wages questions and other grievances is now the recognised method of settling disputes. For instance, in the recent cotton trade labour trouble, conciliation was provided for in the famous "Brooklands Agreement," and in the engineering trades the "Terms of Settlement" provide conciliatory mediums for dealing with and settling all disputes by local and central conferences for nearly the whole of the United Kingdom.

The duties of the Conciliation and Arbitration Boards vary considerably. A few limit their operations to determining the general level of wages for the particular industry they control over a large area, without taking into account local questions; others deal only with controversies connected with individual works; others, again, take charge of the demarcation of work between separate trades; while the majority consider all questions, whether general or only affecting particular firms, and whether referring to wages or to other matters concerning employers and employees, within the scope of their own trade and area. If evidence were required of the value of the work accomplished by these Boards in preventing stoppage of work, ample proof is afforded by the following figures. Out of a total of 7,248 cases settled, by means of the intervention of Boards or Committees, in ten years, only 92 (approximately 1%) were preceded by the cessation of working operations. In the majority of cases, the rules provide that work shall not be stopped by either party until the Board have considered the disputed point; and some of the Boards emphatically decline to deal with the questions in dispute until operations have been resumed. Many of the Boards provide that their decisions, or the final awards of the arbitrators appointed by them, shall be regarded as final and binding upon both parties; and even go to the extent of inflicting a pecuniary penalty in the event of breach of agreement or award.

THE ROYAL COMMISSION ON SHIPPING RINGS.

At a recent meeting of the Royal Commission on Shipping Rings, Mr. John McLaren, a senior partner in the firm of J. and H. McLaren, general engineers, gave evidence on behalf of the Leeds Chamber of Commerce and the Agricultural Engineers' Association. He also spoke as an "aggrieved trader." His complaint was that shipping rates were too high, such rates being rendered possible by the combination of shipowners, who raised prices and stifled competition. Deferred rebate was one of the most powerful weapons of the "combines." He believed that companies could carry at much lower rates if it were not for the expense of running high-speed steamers for mails and passengers who benefited at the expense of the trader, who had to pay higher rates on his goods to supplement the inadequate fares and mail subsidies of the high-speed steamers. The rates to South America were 50% higher by the Conference steamers than any others; in some trades, unfortunately—New Zealand, for example—shippers were unable to take outside steamers, as the whole trade was under the control of the "ring."

In cases where deferred rebates existed, owners had no hesitation in taking advantage of the ignorance of shippers, who had no opportunity for judging whether they were getting the same treatment as their opponents. Foreigners frequently received preferential rates. The arbitrary policy of the "rings" was soon shown by the speedy manner in which an outside ship was squeezed off the berth; the alacrity with which rates were lowered in order to do this seemed to indicate that there was ample margin for an all-round reduction. The action of the "ring" amounted to nothing less than a restraint of trade. Shipowners ought to be limited and controlled in regard to their action. He recommended that the Government be asked to make the deferred rebate illegal.

Mr. E. B. Tredwen, who was recalled before the Commission, thought that where a rebate system was carried out wisely it was an advantage to British trade, and secured

Digitized by Google

trade to British shippers and merchants. Mr. A. S. Gladstone considered that shipping "rings," with or without rebates, would be beneficial to trade so long as they gave the general body of shippers what they required —(1) an adequate service of steamers; (2) moderate freight rates; and (3) equal treatment to all shippers, large and small.

FOREIGN INVESTMENTS.

An agreement has been concluded between Great Britain and France for the suppression of fraudulent income and personal property returns in the two countries. More efficient guarantees for the recovery of succession duties are to be afforded, and, if necessary, of income tax also. According to the *Actien*, of Paris, the convention consists of four articles; in the first two it is stipulated that Great Britain and France shall communicate reciprocally copies of succession declarations made in the country in which the deceased person, whose estate is in question, resides. The third article provides that negotiations under the Convention shall be carried on directly between the Ministers of Finance of the two countries without the necessity of diplomatic intervention on the part of the respective Foreign Offices; the fourth article deals with the ratification of the Convention.

M. Jules Roche, interviewed by a representative of the *Liberte*, said this Agreement would be no more effective than that made with Belgium in 1843. To have the force of law it needed the ratification of Parliament; if that were given, French capital would leave English banking and seek an asylum elsewhere—probably in Belgium, a Belgian Minister having recently declared that his country would never enter into such undertakings with regard to French capital. The *Temps* is sceptical as to Great Britain's part in the Agreement. The *Journal des Debats* also has not much faith in Great Britain's subscription to such a measure. "France," it says, "would benefit by this exchange of fiscal methods much more than Great Britain, who would not venture upon a course which Belgium refused to take."

ACETIC ACID MANUFACTURE.

THE *Chemist and Druggist* says:—"Rumours are abroad of the intention of the Revenue authorities to permit the use of duty-free spirit for making acetic acid or 'white vinegar.' There is no doubt that a desire exists among producers of acetic acid to utilise alcohol, and it is probable that Somerset House has been approached on the subject. One point may be mentioned, as indicating the trend of official thought, and that is the subject of acetifying acohol from duty-free spirit was given as an examination test subject for certain official candidates aspiring to sit in high places at Somerset House. It appears to be not an unusual practice of the 'powers that be' to set their staff to discuss knotty and intricate fiscal problems that crop up from time to time with a view to seeing if it be possible to establish some *via media* whereby the interests of trade can be furthered without jeopardising those of the Revenue. If the question recently put to the official candidates has originated in the manner suggested, then it will serve to show that it lies still on the official anvil, and is being hammered at with a utilitarian view. Revenue authorities are slow to take action, especially in instances where trade expansion leads to new fields untrodden by the paths of experience. This question of relieving spirit from duty for the manufacture of acetic acid is a case in point. No doubt the utmost care and circumspection are demanded by the custodians of the Revenue, since concessions once granted become like the laws of the Medes and Persians—irrevocable. In discussing this question of alcohol oxidation the interests of both trade and revenue are intertwined, and in any request made by chemists and others for permission to receive duty-free spirit, the feasibility of the proposal is one of the features that must have presented itself to the judgment of applicants. Perhaps one of the best guides as to the practicability of the scheme is the procedure in Germany, although it by no means follows that the fiscal conditions of one country will apply to those of another. In Berlin duty-free alcohol is taken account of by an Excise officer, who sees it mixed with a specified quantity of acetic acid and removed to the percolating-vats. The high duty on spirits in the United Kingdom would undoubtedly compel a much closer official supervision than that existing in Germany, since the temptation to abstract would be correspondingly greater. If chemists were to devise spirit-oxidising plant which would prevent the abstraction of the dutiable article, the minds of the Revenue authorities would be satisfied. As about 30% of the spirit used in making acetic acid is wasted, closed vessels are as much to the manufacturer's interest as the desire of the Revenue. When it is considered that over 6,000,000 proof gals. of duty-free spirit is used annually in Germany for the production of 'white vinegar,' and that the vinegar export trade in the United Kingdom is a rapidly developing one, the great importance to the industrial classes of this country of securing the same kind of raw article is obvious. Seeing that the conversion of the spirit into acid is a matter of from three to four hours only, the process possesses irresistible charms to both capitalist and chemist."

CHEMICAL MANURES IN EGYPT.

THE total imports of artificial manures into Egypt in 1906 amounted to 12,725 tons, valued at £E122,709. These figures compare with 2,152 tons, valued at £E12,912. in 1902, while the figures for the first nine months of 1907 were 7,579 tons, valued at £E76,907. (£1 = £1 0s.6d.) The monthly *Journal* of the British Chamber of Commerce of Egypt observes that the Egyptian trade in artificial fertilisers has been increasing by leaps and bounds, and will undoubtedly continue to do so for some time to come. Statistics accompanying the article show the general advances which have taken place during the last few years. It is noteworthy that although the United Kingdom's share of the trade increased from 340 tons in 1902 to 1,811 tons in 1906, that of Belgium advanced still more rapidly, from 232 tons to 8,063 tons; whereas the United States, which was not in the market in the former year, sent 2,798 tons in 1906.

Apart from the influence of the Assouan Dam and other irrigation works in largely increasing the area of cultivable land, and so causing a greater demand for manures, the main reason for the recent rapid growth in the trade is the fact that the native is now endeavouring to grow cotton once every two years instead of once in three, and consequently finds the use of fertilisers to be essential. Prior to the introduction of artificial fertilisers, the credit for which is due almost entirely to the Khedivial Agricultural Society, the native mainly depended upon "Sabakh," that is to say, the remains of old buildings, villages, and cemeteries, for his manure. Such remains—generally in the form of small hills—were found all over the Delta, but they are gradually becoming appreciably scarcer, or too far away from the scenes of cultivation. Other native manures are river and canal mud, and stable refuse, but these, together with "Sabakh," are totally insufficient to meet the requirements of the country, and therefore chemical manure imports are likely to still further largely develop.

For cotton, the native usually puts on each feddan (a little more than an acre) 200 kilos. of superphosphates, and from 80 to 90 kilos. of nitrogenous fertilisers, of which about two-thirds are nitrate of soda and one-third sulphate of ammonia. Manures in these proportions will cost about £1. 16s. 11d. to

Digitized by Google

£1. 17s. 11d., delivered to any railway station in Lower Egypt. For wheat, the cultivator uses from 90 to 100 kilos. of nitrate of soda per feddan. He can obtain this delivered to any station in Lower Egypt from £1. 3s. 7d. to £1. 4s. 7d. per feddan.

The prices of chemical manures vary considerably from time to time, but the following, which include packing in double sacks, may be taken as average rates:—

Nitrate of soda .. .. £12. 10s. per ton, c.i.f. Alexandria.
Sulphate of ammonia.. £13. to £13. 5s. ,, ,, ,,
Superphosphates .. £3. 2s. to £3. 6s. ,, ,,

Owing to the very small Egyptian demand prior to last year, it was found cheaper and more convenient to bring the nitrate of soda from Chili to Belgium, and then tranship to Alexandria, according to requirements. This largely accounts for the fact that in 1905 Belgium had practically the whole of the Egyptian trade. In 1906, the sales having increased so enormously, the Khedivial Agricultural Society of Cairo chartered two vessels and brought full cargoes (besides having part cargoes on other ships) direct from Chili to Alexandria, and the same process is being repeated this year. Belgium is the principal source of supply for superphosphates, the manures being actually prepared in that country. Glasgow also ships a few superphosphates, but Antwerp does nearly the whole of the trade. In the case of sulphate of ammonia, the main port of shipment is Glasgow, after which comes Antwerp.

Practically the only manures manufactured in Egypt are those turned out by the Cairo Sewage Transport Co., such as "Poudrette" and other sewage products. The company also works up various slaughter-house products, such as dried blood, powdered hoof, and horn and ground bones. When these were first put on the market some years ago the company had great difficulty in selling them, as the natives did not appreciate the value of artificial manures, and, moreover, were not in a good enough financial position to incur the necessary expense. The difficulties, however, have now been overcome, thanks to the work done by the Khedivial Agricultural Society in educating the natives in the use of fertilisers, and also to the fact that the fellaheen can now afford to pay for them.

The Khedivial Agricultural Society, of which mention has already been made, has interested itself in the distribution of chemical manures during the past six or seven years. With the object of assisting the Society in this work, the Government, between September and December, 1906, lent them £100,000. at 2% per annum interest.

It may be mentioned also, that the Egyptian Markets, Ltd., have recently entered into the trade of supplying the natives with artificial manures. The company, which was established in 1898, with a capital of £175,000., runs official markets in 120 centres in Egypt, and therefore possesses the necessary organisation for distributing the fertilisers direct to the Arabs.

The imports of chemical manures are allowed into the country duty free (the only other instance of free entry being books by parcel post) and special reduced rates are in force on the State railways for carriage into the interior. It will thus be seen that the Government is encouraging the native as far as possible to use chemical manures. There is no monopoly for the import of artificial fertilisers, and any manufacturer or merchant is thus able to engage in the trade.

TEBRAU JAHORE RUBBER SYNDICATE LTD.—Capital £30,000, in £1. shares. This syndicate has been formed to acquire and develop the estates of Tebrau, Johore, to acquire by purchase or lease, in the Malay Peninsula or elsewhere, estates on which rubber trees have been planted, or which may be suitable for the cultivation of rubber, and to carry on the business of manufacturers of and dealers in rubber, etc. The first directors are P. M. Matthew, F. W. Carter, and J. E. E. Corstorphine; qualification 500 shares; remuneration £175. per annum, divided. Registered office, 5, St. Andrew-square, Edinburgh.

CALCIUM CYANAMIDE.

THE *Engineering and Mining Journal* (New York) states that the American Cyanamide Company, of that city, intend to build a plant for the manufacture of calcium cyanamide at Muscle Shoals, on the Tennessee River in Northern Alabama. The initial capacity of the plant will be 40,000 tons per annum.

Our New York contemporary gives the following list of cyanamide works in course of construction in Europe:—

Name of Company.	Location of Works.	Annual Capacity in Tons.
North-western Cynnamid Company of London	Odde Norway	13 550
Ostdeutsche Kalkstickstoffwerke vom Berlin	Muhlthal. Prussia	3.300
Société Suiss Probera Azotati	Martigny Switzerland	4,400
Société Francais Pour Produits Azotati de Paris	Notre dame de Brianon, Savoy, France	13,200
Cyanid Gesellschaft vom Berlin	Trosberg, Bavaria	16,500
Società Italiana pel Carburo di Calcio di Roma	Calleestetti, Italy	13.750
Società Italiana pel Carburo di Calcio di Roma	Sebenico, Dalmatia. Austria	27 500
Società Italiana pel Carburo di Calcio di Roma	Almissa Dalmatia	50 000
San Marcel Compagana	Italy	8 250
Società Italiana per la Fabricazione di Produtti Azotati di Roma	Piana d'Orta, Italy	11.550
Società Italiana per la Fabricazione di Produtti Azotati di Roma	Fiume, Dalmatia	4 400

"The Società Generale per la Cianamide, of Rome, Italy, holds all patents covering the manufacture and use of the product, and has had an experimental plant in operation for the past three years. Licences for the manufacture of calcium cyanamide have been sold in all civilised countries, and plants with capacities of 40,000 and 50,000 tons per annum are projected in Europe.

"The tonnages indicated in the last column represent initial capacities; the ultimate capacities will be about twice the amounts shown. The plant at Piana d'Orta is now in operation, producing at the rate of 4,000 tons; the others will begin about January 1, 1908, or within a few months of that time."

THE BRITISH COLUMBIAN ZINC INDUSTRY.

THE Canadian Government recently issued a report of a Commission appointed to investigate the zinc resources of British Columbia. The chief conclusions of the Commission are, that although the zinc industry is yet in its infancy in British Columbia, it is capable of great development. While several of the mines now being worked are essentially zinc mines, there are some silver-lead mines in which zinc blende is found in considerable quantities. Until recently the zinc in the silver-lead ores was regarded as an impurity to be got rid of by the easiest and cheapest means possible. The recent increased demand for zinc has enhanced the value as a by-product of the zinc-blende, which was formerly a troublesome impurity. The Commission regards 15,000 tons of zinc ore of 50% grade as a liberal estimate of the present annual production of the Slocan district, and it is calculated that the Ainsworth district can produce 100 tons daily of 50% ore. There are many mines and prospects in other portions of the province which are supposed to carry zinc in paying quantities. A zinc smelter has been established at Frank, Alberta, the plant being close to a coal mine and on the route from the mines to the market. The large amount of fuel required in reducing zinc ore renders it necessary that coal shall be near the smelter. Coal can be delivered at the Frank smelter at less than $1. per ton.

SOCIETY OF CHEMICAL INDUSTRY.

LONDON SECTION.

A MEETING of this Section was held at Burlington House on December 2, Mr. R. J. Friswell in the chair. The first paper, on "The Estimation of Naphthalene in Coal-Gas and Spent Oxide of Iron," was read by Mr. C. J. Dickenson-Gair. The methods of estimation given in the paper are as follows:—The Acetic Acid Method: 300 or 400 c.c. of acetic acid solution are placed in two Dreschel bottles coupled with a third bottle, containing picric acid solution, as a catch. About 10 cub. ft. of the coal-gas are passed through, and the contents of the bottles then mixed with 500 c.c. of strong picric acid solution. On agitating, pure naphthalene picrate separates out and is filtered. The precipitate is washed with N/40 picric acid solution, to free it from acetic acid, and N/10 NaOH is added, until there is an excess after boiling for ten minutes. The excess of soda is found by titration while hot, first with N/20 picric acid, and then with N/10 NaOH, using lacmoid indicator. From these figures the amount of N/10 NaOH used up in the reaction is found; each c.c. = ·197 grains naphthalene. The Reprecipitation Method: The test is commenced in a similar manner to Colman and Smith's, only picric acid solution being used. The mixture of naphthalene and naphthalene picrate is filtered off and transferred to a flask, 50 to 100 c.c. absolute alcohol being added. A clear yellow solution results. About 300c.c. concentrated picric acid solution are added, and on agitation pure naphthalene picrate separates out. The same procedure is subsequently followed, as in the acetic acid method, but the washing with picric acid is omitted. Experiments proved both methods to be perfectly reliable, and very rapid in execution. A modification of this test is made use of in estimating naphthalene in spent oxide of iron. Ten grammes of the undried oxide are mixed with 100 c.c. 80% alcohol; the flask is agitated, allowed to stand several hours, and the liquid filtered; 300 c.c. strong picric acid solution are then added to the filtrate and washings. On agitation, naphthalene picrate separates out, and is treated as in the reprecipitation method.

A "Note on the Influence of Formal on the Properties of Funtumia Elastica" was communicated by Dr. P. Schidrowitz and Mr. F. Kaye. The authors find that the rubber obtained from the latex treated by formal, although less elastic and resilient than that obtained by other means, was extraordinarily tough. They suggest that a rubber of this character might be particularly suitable for some purposes, *e.g.*, for the covers of motor tyres, where toughness is of relatively greater importance than resiliency, and that in the future it may be found desirable to use different methods of coagulation for the same latex, according to the purpose for which the rubber is intended.

Dr. J. Lewkowitsch read a paper on "Niam Fat." Niam fat was obtained from the seeds of *Lophira alata* Banks, a tree indigenous to Senegambia, Sierra Leone, and the Egyptian Soudan. The fat freed from extraneous matter forms 41% of the kernels. It is a soft, buttery mass, melting at 24° C., and is used by the natives for culinary purposes and as a hair oil. The following characteristics were determined in two specimens:—

	Fat extracted from kernels.	Fat prepared by natives.
Sp. gr. at 40° C. (water at 40° = 1)	0.9105	0.9063
Acid value	18.54	5.78
Saponification value	195.6	190.1
Unsaponifiable matter	1.49	1.38
Iodine value	68.4	78.72
Mean molecular weight of the fatty acids	283.7	
Solidifying point of the fatty acids	42.5° C.	

A paper by Mr. Francis Watts and Mr. H. A. Tempany, on "The Polarimetric Determination of Sucrose," was also read. The following is an abstract:—

(1.) *Effect of basic Lead Acetate on the Optical Activity of Sugar Solutions.*—In the polarimetric determination of sucrose in raw sugars, the most suitable and convenient method of defecation is by means of basic lead acetate. Formerly, solutions of the acetate were used, but it was shown that by this means errors of concentration were introduced, owing to the space taken up by the precipitate formed. Horne proposed the use of the anhydrous acetate in place of a solution, as almost removing this source of error, and in a former paper the authors supported this contention by further experimental work. But some investigators still maintain that there is a serious error in the polarimetric readings caused by the direct action of the basic acetate on the invert and non-sugars present. In the present paper it is shown that in ordinary raw sugars, if only slight excess of the basic acetate is used, the error is so small as to be negligible. If large excess is used the error becomes serious. The authors consider that the error in reading is due to the basic portion of the lead present, and that if acetic acid is added sufficient to just neutralise the basicity, the normal reading is restored. In the determination of molasses, however, the quantities of basic acetate required are so large that the error is considerable, and after partial clarification with anhydrous basic acetate the solution should be mixed with sulphur dioxide, which practically restores the normal rotation.

(2.) *The Effect of Clarification with Basic Lead Acetate on Cane Juice.*—In raw sugars clarified by basic acetate of lead, the primary precipitates contain usually from 50 to 60% of lead oxide, the basic acetate itself containing 81.4%. The clarified liquor almost always contains lead, but still generally gives a further light lemon-yellow coloured precipitate on the addition of more basic acetate. The authors find this precipitate to contain 81% of lead oxide and a very little organic matter which appears to be of a pectinous nature. They believe the lead present in the clarified juice to be due to traces of organic lead salts arising from the neutralisation of the basic lead by organic acids present in the sugars. The influence of these traces of lead salts in the clarified juices on the determination of invert by Fehling solution has been investigated, and it is found that this, though existent, is so slight as to be negligible unless large excess of basic oxide has been used.

NOTTINGHAM SECTION.

A meeting of this Section was held at University College, Nottingham, on December 18, Mr. O. Quibell being in the chair. Mr. S. R. Trotman, the Nottingham City Analyst, read two papers, the first one, "On the Analysis of Disinfectants containing Resin," dealt with experiments which showed that, in the presence of resins, the ordinary processes of estimating tar acids in disinfectants by distillation give results which are too high, owing to the resin acids being carried over with the phenol. The second paper dealt with "The Effects of the Soda Boil on Cotton." This gave details of experiments conducted to ascertain the correct lengths for loss in weight and alteration in counts in cotton yarn caused by the soap boil. A vote of thanks to the author terminated the proceedings.

THE GREAT CEMENT PROPRIETARY, LTD.—The report states that for the year ended September 30 last there is an excess of expenditure over receipts in Western Australia of £538. The expenditure in London was £124., and the interest on loans £1,479.

PRUSSIAN SCHOOLS.—The official journal for the Administration for Commerce and Trades publishes the following statistics concerning the technical public schools in Prussia:—During the winter half-year, 1906-07, there were 19 technical schools in Prussia giving public instruction in the manufacture of machinery and kindred lines, which were attended by 3,252 students. The 23 technical schools for the building trades had an attendance of 5,287 scholars; those teaching artistic trades and handicrafts had 4,118, and the 13 textile trade schools 1,783 scholars. In addition there were 1,408 public trade-finishing schools having 236,110 scholars, whose attendance was compulsory, and 85 similar schools where 20,390 voluntary scholars received instruction. Of the public commercial finishing schools 276 gave instruction to 31,194 male and female scholars, whose attendance was compulsory, and in 58 similar schools 7,737 voluntary scholars of both sexes took instruction. Some of the schools are conducted and supported entirely by the Government; others are carried on at the expense of cities, municipal and district communities, and receive an annual subvention from the Government. There are day and night and Sunday classes, so as to afford opportunity for instruction to those who cannot attend during daytime or on week days. Besides, there exist 409 technical schools, with 23,728 scholars, which are controlled and supported by industrial or commercial corporations or associations; also 42 technical schools, with 4,841 scholars, which are annexed to and supported by great manufacturing firms.

Reports of Companies.

PACIFIC NITRATE CO.

The second annual meeting of this company was held last week. Mr. H. W. Morrison, who presided, in moving the adoption of the report and balance sheet, said he regretted that they were unable to show larger working profits. It was a consolation, however, to be able to assure them that the results in no way reflected upon the value of their property; they were entirely accounted for by the fact that they had had to erect and start working their oficinas under circumstances of great difficulty. Their troubles were of a temporary nature, and the directors had now been informed that for the most part they had been overcome. The main difficulty had been the question of water supply, which had curtailed the manufacture of nitrate. Their total production from their two oficinas had only amounted to 260,000 quintals, and when they took into consideration the fact that this small output had had to bear all the fixed charges, it could not be wondered at that the working profit was insignificant. The result for the month of September showed a very great improvement, and he felt convinced they had now turned the corner. They had produced 70,000 quintals of nitrate for the month at a good profit, and he was convinced they would continue to improve upon those results. Their agents assured them the water difficulty had now been practically overcome. Nothing had occurred to diminish their faith in the value of their property.—The motion for adoption was seconded and unanimously carried.

BRITISH WESTINGHOUSE ELECTRICAL COMPANY.

A meeting of debenture holders of the British Westinghouse Electrical Company was held last week, to pass resolutions empowering the postponement of the mortgage and charge of the 4% mortgage debentures in favour of a loan about to be raised by the company by means of an issue of £300,000. of prior lien debentures, carrying interest at a rate not exceeding 6%, redeemable by 1933, or by option of the company at 105% after January 1, 1911. Mr. F. Dawes presided. After a long discussion, an amendment was moved that if the interest was not paid in January next on the 4% debentures the trustees be instructed to foreclose. The chairman was about to put the motion when a holder moved that the meeting be adjourned till the end of January. The amendment being put was carried, but the chairman declared that in view of proxies held the amendment was lost. The original resolution was then put after a considerable number had left the room, and was lost by eight votes in favour and thirteen against. The result of the subsequent poll was in favour of the resolution, as a result of proxies held by the chairman, and he declared it carried.

SULPHIDE CORPORATION, LTD.

The Earl of Kintore, presiding at the meeting of the Sulphide Corporation, Ltd., said the past year had been an exceptional one owing to the amount of construction work on hand, which had involved a strain on the managers and staff in Australia, and on their financial resources, which was clearly indicated in the accounts. The chief features of the year had been the largest capital expenditure they had ever had to face, and the lowest output on record of crude ore from the mine. This expenditure was absolutely necessary, and, as the result of it, they had now a shaft which would be unaffected by the surface movements which spoiled the old one. The capital expenditure was now at an end, and the profits would be available for dividend.

CAPE COPPER CO., LTD.

At the meeting of shareholders, held recently, the Chairman stated that they had made a larger profit in the past year than in the preceding one, the figures being £379,000., an increase of £36,536. He had no hope, however, that they would have any more record-breaking, as the abnormal inflation of prices had ceased, and numerous competitors had been called into existence by the high prices. The large profit had been made despite the fact that the costs had gone up by £21,485., of which £14,253. had been spent in trial works, and £5,483. for increased mining costs at Ookien.

BLEACHERS' ASSOCIATION.

The report for the six months ended September 30 shows, after providing maintenance, upkeep, and prior charges, a net profit of £151,137., as compared with £146,736. at the corresponding period. There is then transferred £25,000. to depreciation fund, the preference dividend is met, and £70,689. is carried forward, which includes £7,279. brought forward at April 1 last.

NEW PEGAMOID, LTD.

The profit for the year amounted to £233., to which must be added £503. brought forward, making £736. The poor results on the year's trading are caused by the progressive rise in the prices of raw materials used by the company and also by the impossibility of obtaining supplies. The directors do not feel justified in declaring a dividend.

IMPROVEMENTS IN THE PRODUCTION OF AMMONIA.

THE following is the full text of the complete specification of British Patent No. 28,964, of 1906, for "Improvements in the Production of Ammonia," granted to Herman Charles Woltereck, of 3, Edinburgh Mansions, Howick Place, Victoria-street, London, S.W.

In the Specification of Letters Patent, No. 16,504, of 1904, "Process for the Production of Ammonia," there is described a process for the production of ammonia consisting in passing air and steam over or through peat at a carefully regulated temperature. For the purposes of such process all peat may be used, whether containing, for example, the quantity of water ordinarily contained in air-dried peat, or, for example, the quantity which the peat generally contains in the bog, that is to say, before it has been subjected to any drying process, whether air-drying or mechanical suction or pressure process. To produce air-dried peat, whether hand or machine-cut, requires considerable labour and repeated handling of the peat. It also requires considerable space for the spreading, footing, and re-footing and stacking of the peat, and is naturally dependent to a great extent upon climatic conditions. To use the peat without eliminating any of the water therewith associated as it comes from the bog means the handling of a material containing possibly 90% of water, or even somewhat more, and accordingly say 10% or less of material other than water.

It has been proposed to reduce the moisture in peat by mechanical means and subsequent air-drying, and to use the dry peat for the production of ammonia. I have found that when all the factors are taken into consideration the most economical method of commercially working the process above referred to is attained by taking the peat from the bog and reducing, without resorting to any air-drying, the water by any suitable mechanical suction or pressure process. It is possible by such a mechanical suction or pressure process to reduce the percentage of water in the peat to, say, 60%, but with ordinary peat containing as it comes from the bog, say, up to 90% or somewhat more of water, the mechanical elimination of water is not so advantageous when carried further than to reduce the percentage of water to, say, 65 to 70%. It will be appreciated that the peat does not require to be cut in the manner customary where air-drying is intended. It may be excavated by machinery discharging directly on trucks, which convey the wet peat to the place where its water is mechanically reduced.

A further and very important advantage of my present invention is that the peat charged into the retorts in the practice of the above-mentioned process for the production of ammonia contains a substantially uniform percentage of moisture, and accordingly the regulation of the temperature is facilitated.

According to my present invention, I accordingly, with a view to obtain the greatest economical success and to facilitate the regulation of the temperature in the above-mentioned process for obtaining ammonia by passing air and steam over or through peat at a carefully regulated temperature, mechanically eliminate most of the water contained in the peat as it comes from the bog, which can be so eliminated.

The claims are:—(1.) The improvement in the process herein referred to for obtaining ammonia consisting in reducing by suitable suction or pressure the water in the peat to be employed in such process to 65 to 70%, without further drying.

(2.) The use in the process herein referred to for obtaining ammonia of peat whose water content has been reduced to about 65 to 70% by suitable suction or pressure.

THE CLASSIFICATION AND USES OF CEMENT.*

BY SAMUEL S. SADTLER.

(*Concluded from p. 496.*)

(6.) *Setting by Chemical Action.*—Under this classification we have several of the most useful cements known. In most cases, however, the action is too rapid, so that setting takes place before the cement is in position. Dilution of the active ingredients is the general remedy for this. There are also specific ones. As examples of the most useful cements, the oxy-chlorides may be mentioned, which remain nicely liquid or plastic for ample time to use and then set up very strong and hard. The well-known glycerine-litharge cement acts nicely in this respect. Cements formed from silicate of soda and oxides of lime, magnesia, zinc, etc., and those formed by the action of their oxides on casein and albumen, do not act so well. They are liable to set up too soon and be crumbly when set up.

(7.) *Setting by Combined Action.*—The most prominent case of this kind is the setting of glue. In the first place, when used, it is a melted mass that, on cooling, has fair strength of coherence and adherence. Then, however, as the water is absorbed by the wood or other material being cemented, it becomes stronger until very great strength is developed when free of water.

Other cases are when a solvent or heat is used with a resin, boiled oil, etc., mixed with a metallic oxide such as lime. There is then the combined action of the evaporation and the formation of new compounds or so-called metallic soaps.

INERT SUBSTANCES.

These useful, harmless substances do not make a cement, but so many formulas differ only in the choice of them that it might be supposed they did. Sometimes a little work is required of them, as when there is water to be taken up. Plaster and Portland cement serve this purpose. Zinc oxide and other basic substances, while mainly serving as fillers, absorb acid in addition. In most cases, however, no action of this kind is required, and it is merely a matter of giving body or other physical properties.

A classification of fillers may be made as follows :—

Corrective.	Porous.	Strength.	Finely divided.
Portland cement.	Infusorial earth.	Asbestos.	Cement.
Plaster of Paris.	Magnesium carbonate.	Hair.	Clay.
———		Plush trimmings.	Plaster.
Zinc Oxide.		Cloth.	Gypsum.
Lime.		Tow.	Whiting.
Whiting.		Oakum.	Silica.
Magnesia.			Powdered glass.
			,, fluorspar.

COMPOSITION OF CEMENTS.

Cements that have come into use to any extent may be placed in classes according to their composition as follows :—

(1.) (*a*) Rubber solutions. (*b*) Guttapercha solution. (*c*) Pyroxylin solution (collodion.) (*d*) Gum resin solutions (such as mastic and copal). (2.) Silicate of soda and neutral filters. (3.) (*a*) Flour pastes. (*b*) Starch pastes. (*c*) Dextrin pastes. (*d*) Gum solutions (such as arabic, tragacanth). (4.) (*a*) Plaster of Paris. (*b*) Portland cement. (5.) (*a*) Bitumens (pitch, tar, asphalts, etc.). (*b*) Resins (resin and gum resin in melted state). (*c*) Sulphur. (*d*) Shellac. (*e*) Rubber and guttapercha, melted or thinned with oil. (6.) Iron powder compositions. (7.) Drying oil mixtures. (8.) Oxychloride cements. (9.) Glycerin and sugar compounds of lead. (10.) (*a*) Glue. (*b*) Casein. (*c*) Albumen. (11.) Cements made from metallic oxides and strong acids. (12.) (*a*) Vitreous and vitrifying mixtures. (*b*) Clay and asbestos, etc., with water.

Class (1)—(*a*), (*b*), and (*c*) are especially waterproof, tough, and tenacious; (*d*) is not so tenacious, but answers the other requirements, adheres better to smooth surfaces, has greater hardness when set, and is transparent in thin layers, in which it is frequently used for optical purposes; (*a*), (*b*), and (*c*) are generally made up with fillers to prevent the formation of voids on the evaporation of the solvent.

Class (2.) Not waterproof, but form very dense, hard and strong lutes. Especially good for hot gases, in which case the water of the silicate can go off. They are useful for organic solvents and stick only too well to glass. Suitable fillers are barytes, whiting, silica, powdered glass and powdered fluorspar. The three latter probably slowly react with the silicate with beneficial results.

Class (3.) Are used for fastening paper and cloth.

Class (4.) This is a most important class. (*a*) is generally used without filler, although frequently mixed with alum, etc., for purposes of increasing the density. It is used for filling hollow articles, moulds, etc. (*b*) is the most used of all cements. It is made into concrete for building purposes, etc. For use in small amounts it is not successful as the water dries before it can set.

The making of cement concrete waterproof is an art not understood by all. The main points to be considered are to have the voids as few as possible, and the dense coating on the side the water would enter. Neat cement is probably most used for this denser coating. It should be used as strong as it will flow well into crevices, and hot if possible. The condition of the work and the kind of cement are important. It is waterproofed best when fresh, and if washes such as silicate of soda, skimmed milk and casein solution are used, an over-limed cement is desirable. Magnesia cement has been recommended for this purpose, but the chloride is liable to soak in and not combine properly with the oxide.

Class (5.) This is a very important class, if the number of formulas are a criterion. The materials must be applied in melted condition. The marine glues are made from materials of this class. Sulphur is much used by itself, and sealing wax is also of this class.

Class (6.) The use of this material has been referred to above.

Class (7.) Putty and red lead compositions are among the best known cements. Boiled linseed oil is invariably used, and if rosin is dissolved in it and metallic oxides mixed therewith a much thicker composition is obtained thereby than otherwise. When very much oxidised by exposure to heated air in their films and mixed with powdered cork, etc., linoleum can be produced.

Class (8.) Oxy-chloride of zinc has been used for dental purposes and forms a very dense, strong, stone-like cement. Oxy-chloride of magnesium is, however, more used, as the ingredients are cheaper. It is used for uniting particles of stone either for refacing the same or make an artificial stone, for making compositions with saw dust for a kind of floor tiling.

Class (9.) This class is a valuable one, embracing the well-known glycerine and litharge cement, much used for joining glass to metals, etc. It is waterproof, acid proof, gas proof, and not attacked by organic solvents.

Class (10) Casein and albumen form very strong compositions with lime, zinc oxide, etc. They set up very quickly, so must be used at once. They are more in the nature of lutes than cements properly considered.

Class (11) The combination of zinc and other oxides and phosphoric acid stands for this class. It is much used by dentists and forms a hard, dense, waterproof substance.

Class (12.) This class includes glass powders or glass forming mixtures that bind surfaces at high temperatures.

With a view of choosing a cement only the most general statements can be made here. In two previous papers† details of formulas have been given by the writer.

The following suggestions may be of use, however, the numbers referring to the classification above :—Hot surfaces, 2, 4a, 9, 10 and 12. Elastic, 1a, 1b. Water and steam, 5a, 5b, 5e, 6, 7 and 9. Strength, 2, 4b, 8, 9, 10a, and 12. Expanding, 4b and 6. Quick setting, acid proof, 1a, 1b, 1c, 2, 5a, 5b, 5c, 5e, 9. High temperature (moderate), 4b, 6. High temperature (excessive), 12a, 12b.

DETAILS OF USE.

It is a matter of importance that a cement be used under favourable conditions. It might seem superfluous to say that the "work" should be clean, but in large factories there is frequently a great deal of dust, moisture, grease, etc., that deposits on pipes and other places where joints are to be sealed.

Air films should be displaced by heating the "work." This prevents a chilling of the cement, which might fail to adhere if not used into the surfaces where applied. Some writers have insisted upon this heating as a *sine qua non* of success. But it is manifestly impossible in some cases. An alternative to this is to paint the surfaces to be joined with a solution of the chief constituent of the cement. A benzol solution, for instance, of

* A paper read before the Franklin Institute.—From the *Journal* of the Institute.

† Jour. Franklin Inst., May, 1904. Trans. Eng. Club of Phil., 21, (1904), 315.

Digitized by Google

pitch, oil, rosin, etc., can be used. If silicate of soda, glycerine, or magnesium chloride are the liquid elements, water can be used as solvent for this painting.

Surfaces should fit as closely as possible before the cement is used. Use as little cement as possible.

Preservatives such as sodium salicylate, benzote, or an essential oil may be used in small amounts for pastes and mucilages that would spoil otherwise on exposure. It is a good plan to have some cements or lutes most used for any particular line of work made up ready to be mixed or applied.

Analytical Notes.

THE DETERMINATION OF CHLORIDES OR BROMIDES IN THE PRESENCE OF SULPHOCYANATES.*

By M. A. Rosanoff and Arthur E. Hill.

(1.) *Introductory.*

In the course of a research undertaken in the Havemeyer Chemical Laboratory, New York University, it became necessary to analyse a number of solutions containing mixtures of chlorides and sulphocyanates. Investigation of the literature of the subject showed that no method exists by which such mixtures can be analysed quickly and accurately; it was found that those methods which can be relied upon for accuracy of results require such expenditure of time as prohibits their use where large numbers of analyses must be performed. In like manner search revealed no suitable method for the analysis of bromide-sulphocyanate mixtures.

To remedy this lack, the following volumetric method is proposed. It permits of an accuracy within the limits of the usual errors of measurement with pipettes and burettes, and requires less time than any of the existing methods; a single complete determination has been found to require about one and a half hours, while two determinations can be performed without difficulty in two hours. By proper organisation of the work eight to ten analyses can easily be made within a working day.

The sum of chloride and sulphocyanate, or of bromide and sulphocyanate, is established by precipitation with excess of standardised silver nitrate and determination of the excess by titration with standardised ammonium sulphocyanate, according to the method of Volhard (*Journ. Prakt. Chem.*, 1874, ix., 217; *Zeit. Anal. Chem.*, 1874, xiii., 171). Precipitates containing silver chloride must be filtered off before the excess of silver nitrate is determined, while in the case of the bromide filtration is unnecessary (Rosanoff and Hill, *Journ. Am. Chem. Soc.*, 1907, xxix., 269; *Chemical News*, xcvi., 264; *Chem. Centr.*, 1907, i., 1596). The new method has for its object the determination of the chloride or bromide in a fresh sample of the solution, by oxidising the sulphocyanate to hydrocyanic acid by means of nitric acid, expelling nearly all the hydrocyanic acid, and determining the residual chloride or bromide, in the presence of the traces of cyanide, by the Volhard method. The sulphocyanate originally present is found by difference.

(2.) *Determination of Chlorides.*

The following solutions are required:—(*a*) A fifteenth-normal solution of silver nitrate, standardised gravimetrically or by weight of silver nitrate used; (*b*) a fifteenth-normal solution of ammonium sulphocyanate, standardised against the silver nitrate by Volhard's method; (*c*) a saturated solution of iron-ammonium alum, free from chlorides, and treated with nitric acid to lighten the colour.

A measured volume of the chloride-sulphocyanate mixture is diluted so that the normality of the chloride is about one-fiftieth. The solution is treated with 1 cc. of the iron-ammonium alum, and brought to a boil in a large Erlenmeyer flask. To the gently boiling solution concentrated nitric acid is added at the rate of about three drops a minute, during which operation the liquid should be frequently stirred to prevent superebullition. The addition of the acid in the above described manner is continued until the colour of the solution has faded to a *pale orange*, and then, without further addition of acid, the solution is allowed to boil for a few minutes longer, by which treatment the last traces of sulphocyanate are oxidised. The complete oxidation requires about twenty minutes' time; a change of colour to pure yellow indicates the completion of the operation. The odour of hydrocyanic acid is now practically gone.

Cool the solution thoroughly under the tap, and add to it one-third its volume of concentrated nitric acid. Add a measured amount of N/15 silver nitrate in moderate excess above the quantity required to precipitate the chloride and shake the mixture until the precipitate is well coagulated, which requires but a few minutes' agitation when the solution is cool, but *a much longer time if the solution is heated.* When the precipitate is well coagulated, bring the solution again to a gentle boil, maintaining it at this temperature for about five minutes. The liquid above the precipitate must become perfectly clear.

Filter the solution while still hot through a rapid-running double filter, paying no attention to the opalescence which forms in the filtrate upon cooling. Wash the precipitate with hot water containing a few drops of nitric acid. Allow the liquid to cool thoroughly, dilute until the volume is about three times that of the solution before filtration, add 2 cc. of the iron indicator for every 100 cc. of solution, and run in the standardised sulphocyanate to a strong red colour. Stir the solution for five minutes, and then add the standardised silver nitrate drop by drop, with stirring, until the colour just disappears. A single drop of the sulphocyanate solution should then give a permanent pink colour; should it fail to do so, titrate back and forth with the silver nitrate and ammonium sulphocyanate until the colour changes on addition of a single drop. The titration is best conducted in a porcelain dish, against the white ground of which the end point is most accurately determined; in glassware transmitted light effects may be misleading. The total silver nitrate added, *minus* the total ammonium sulphocyanate added, is the silver nitrate equivalent of the chloride present.

The following is a list of ten consecutive analyses of mixtures of potassium chloride and sulphocyanate performed according to the foregoing directions:—

	N/15 KCl solution	N/15 KCNS solution	$AgNO_3$ equivalent of KCl taken.	$AgNO_3$ equivalent found	Absolute error.
	Cc.	Cc.			Cc.
(1.)	0.00	25.00	0.00	0.02	+0.02
(2.)	10.00	90.00	9.95	9.96	+0.01
(3.)	25.00	50.00	24.87	24.87	0.00
(4.)	25.00	50.00	24.87	24.86	−0.01
(5.)	25.00	25.00	24.87	24.88	+0.01
(6.)	25.00	25.00	24.87	24.93	+0.06
(7.)	25.00	10.00	24.87	24.83	−0.04
(8.)	25.00	5.00	24.87	24.90	+0.03
(9.)	25.00	3.00	24.87	24.84	−0.03
(10.)	25.00	0.15	24.87	24.90	+0.03

(3.) *Determination of Bromides.*

The analysis of bromide-sulphocyanate mixtures is conducted precisely as that of the chloride mixtures, with three modifications:—(*a*) the solution to be treated with nitric acid for the destruction of the sulphocyanates should be diluted to roughly one-hundredth normality with respect to bromides; (*b*) after the sulphocyanate has been decomposed at the boiling temperature and the liquid thoroughly cooled, only one-sixth its volume of concentrated nitric acid is added; (*c*) the precipitated silver salts should not be filtered off before the excess silver nitrate is determined.

The following analyses of bromide-sulphocyanate mixtures were made according to the above directions:—

	N/15 KBr solution.	N/15 KCNS solution.	$AgNO_3$ equivalent of KBr taken	$AgNO_3$ equivalent found.	Absolute error
	Cc.	Cc			Cc.
(1.)	25.00	0.15	22.72	22.76	+0.04
(2.)	25.00	0.15	22.72	22.69	−0.03
(3.)	25.00	3.00	22.72	22.73	+0.01
(4.)	25.00	5.00	22.72	22.78	+0.06
(5.)	25.00	10.00	22.72	22.69	−0.03
(6.)	25.00	10.00	22.72	22.68	−0.04
(7.)	25.00	25.00	22.72	22.73	+0.01
(8.)	25.00	50.00	22.72	22.74	+0.02
(9.)	25.00	100.00	22.72	22.72	0.00
(10.)	10.00	90.00	9.09	9.12	+0.03

(4.) *Theory of the Method.*

While the best test of a method is in its practical results, it is well to establish clearly the facts upon which it is based. Our

* From the *Journal of the American Chemical Society.*

Digitized by Google

method depends upon the following assumptions:—(1) That sulphocyanates may be decomposed at a temperature of about 100° by such concentrations of nitric acid as are insufficient either to oxidise chlorides of bromides, or to cause the volatilisation of hydrochloric or hydrobromic acid; (2) that all but traces of the hydrocyanic acid formed by this decomposition can be volatilised during the time required for the oxidation itself; (3) that the silver cyanide formed by addition of silver nitrate to this solution is sufficiently soluble in hot nitric acid to be separated quantitatively from the insoluble silver chloride by filtration; and, finally, (4) that small amounts of silver cyanide do not interfere with the determination of the excess of silver by means of a sulphocyanate titration, since it acts as a soluble silver salt. Each of these assumptions has been subjected to experimental investigation.

The quantity of concentrated nitric acid used during the oxidation ordinarily amounts to 2 cc. or less. If acid should be added more rapidly than the decomposition of the sulphocyanate required, there can be present at any time not more than this small amount of acid in solutions, the volume of which is usually about 200 cc. Experiments were, therefore, conducted to ascertain whether this amount of nitric acid could be used without loss of chlorine or bromine from solutions of the concentration used in our analytical method. 200 cc. samples of N/50 chloride solution, or N/100 bromide solution, were boiled gently for fifteen to twenty minutes with varying amounts of concentrated nitric acid, and the distillates, amounting in each case to about 15 cc., were carefully tested for the presence of the halogens. The experiments tabulated below were performed in duplicate:—

N/50 KCl.	Conc. HNO_3.	Vol. of distillate.	Cl Present.
200	1.00	15	None
200	2.00	15	None
200	3.00	15	None
200	4.00	15	None
200	6.00	15	Traces
N/100 KBr.	**Conc. HNO_3.**	**Vol. of distillate.**	**Br. Present.**
200	1.00	15	None
200	2.00	15	None
200	3.00	15	None
200	3.50	15	Traces

The results show that under the conditions of analysis, loss of halogen cannot be caused by the addition of nitric acid and boiling.

The principal, but by no means the only, decomposition product of sulphocyanic acid is hydrocyanic acid. Tests showed that when a pure sulphocyanate is decomposed in the manner described, only traces of hydrocyanic acid remain in the solution; when the decomposition is carried out in the presence of a chloride, amounts are retained corresponding to less than 2 mgrms. of silver cyanide. This rapid loss of hydrocyanic acid during twenty minutes' treatment appeared somewhat surprising in the light of Richards and Singers' observation that the presence of chlorides prevents the expulsion of hydrocyanic acid to a marked extent (*Am. Chem. Journ.*, 1902, xxvii., 208). It occurred to us, therefore, that the decomposition of the sulphocyanate might possibly result in the formation of cyanogen rather than hydrocyanic acid, as was suggested by Knüpffer (*Zeit. Phys. Chem.*, 1898, xxvi., 264), who oxidised the sulphocyanic with acid potassium white. Accordingly, the decomposition products were passed through a solution of potassium hydroxide and the alkaline liquid analysed; it was found to contain cyanide but no cyanate, showing the absence of cyanogen, and indicating that we had in reality to do with a very rapid expulsion of hydrocyanic acid. Richards and Singer (*loc. cit.*) expressed the view that the retention of the hydrocyanic acid by chlorides might be due to the formation of ionic complexes. Assuming this interpretation to be correct, it would appear that the complex requires a measurable time interval for its formation, and that boiling will expel hydrocyanic acid from chloride mixtures much more rapidly at the time of its formation than after the solution has been allowed to stand. It would in all probability be a lengthy operation to volatilise the acid quantitatively, but this is unnecessary in connection with our method.

The solubility of silver cyanide in nitric acid of moderate strength, which is taken advantage of in our method of analysis, was noted by Gregor (*Zeit. Anal. Chem.*, 1894, xxxiii., 33), who showed the marked solubility of the cyanide in 6 to 10% acid. In hot solutions of 25% strength we find its solubility much greater; at 80° about 0.5 cc. of N/15 potassium cyanide and 0.5 cc. of N/15 silver nitrate, corresponding to about 4 mgrms. of silver cyanide, can be added to 200 cc. of the acid without causing any turbidity. The amount of hydrocyanic acid left in the solution in our method is considerably less than the equivalent of this quantity of cyanide, and there is, therefore, no interference with the quantitative separation of the silver chloride from the decomposition products of the sulphocyanate by filtration of a hot nitric acid solution of 25% strength.

That small amounts of silver cyanide can be left in the filtrate without interference with the determination of the total silver by means of a sulphocyanate titration might be expected from the fact that in acid solution silver cyanide is much more soluble than silver sulphocyanate. Consequently, the ammonium sulphocyanate added in the titration will decompose the silver cyanide in the sense of the equation $NH_4CNS + AgCN = AgCNS + NH_4CN$, and it will not be until the ammonium cyanide reaches a considerable concentration that the reverse action will become appreciable. To ascertain how great the concentration of cyanide might safely be allowed to become, the following experiments were conducted. A silver nitrate solution of about N/15 strength was standardised against an ammonium sulphocyanate solution, and to 15 cc. samples of the silver solution varying quantities of a N/15 potassium cyanide solution were added. In the presence of ferric iron as indicator, sulphocyanate was run into the solution until a strong red colour was obtained, the mixture was stirred briskly for five minutes to afford time for the decomposition of the silver cyanide, and then silver nitrate was run in drop by drop, with stirring, to the disappearance of colour. One drop more of the sulphocyanate gave in each case a permanent coloration. The quantity of sulphocyanate required for the total silver was then compared with the quantity as calculated from the original standardisation of the two solutions. The tabulated results show the variation in cc. from the true titre of the solutions, the experiment being performed four times for each concentration of potassium cyanide used.

N/15 KCN taken in cc.	Extreme errors in cc. of N/15 NH_4CNS.
0.10	−0.01 to −0.04
0.20	−0.01 to −0.06
0.30	+0.03 to −0.03
0.40	+0.05 to −0.01
0.50	+0.13 to +0.09
1.00	+0.52 to +0.12

The results show that quantities as great as 0.4 cc. of N/15 potassium cyanide solution do not affect the accuracy of the titration by amounts larger than the errors of measurement, while larger quantities cause perceptible errors in determining the true end-point. In the analytical method proposed, the amount of cyanide left in the solution is much less than half of this maximum amount.

Experiment thus substantiates the correctness of the assumptions involved in our method.

THE NEW PATENTS ACT.

(Continued from page 564.)

85.—(1.) Rules under this Act may authorise the comptroller to refuse to recognise as agent in respect of any business under this Act any person whose name has been erased from the register of patent agents, or who is proved to the satisfaction of the Board of Trade, after being given an opportunity of being heard, to have been convicted of such an offence or to have been guilty of such misconduct as would have rendered him liable, if his name had been on the register of patent agents to have his name erased therefrom, and may authorise the comptroller to refuse to recognise as agent in respect of any business under this Act any company which, if it had been an individual, the comptroller could refuse to recognise as such agent.

(2.) Where a company or firm acts as agents, such rules as aforesaid may authorise the comptroller to refuse to recognise the company or firm as agent if any person whom the comptroller could refuse to recognise as an agent acts as director or manager of the company or is a partner in the firm.

(3.) The comptroller shall refuse to recognise as agent in respect of any business under this Act any person who neither resides nor has a place of business in the United Kingdom or the Isle of Man.

Powers, etc., of Board of Trade.

86.—(1.) The Board of Trade may make such general rules and do such things as they think expedient, subject to the provisions of this Act—

(*a*) For regulating the practice of registration under this Act :
(*b*) For classifying goods for the purposes of designs :
(*c*) For making or requiring duplicates of specifications, drawings, and other documents :
(*d*) For securing and regulating the publishing and selling of copies, at such prices and in such manner as the Board of Trade think fit, of specifications, drawings, and other documents :
(*e*) For securing and regulating the making, printing, publishing, and selling of indexes to, and abridgments of, specifications and other documents in the Patent Office ; and providing for the inspection of indexes and abridgments and other documents :
(*f*) For regulating (with the approval of the Treasury) the presentation of copies of Patent Office publications to patentees and to public authorities, bodies, and institutions at home and abroad :
(*g*) For regulating the keeping of the register of patent agents under this Act :
(*h*) Generally for regulating the business of the Patent Office, and all things by this Act placed under the direction or control of the comptroller, or of the Board of Trade.

(2.) General rules shall whilst in force be of the same effect as if they were contained in this Act.

(3.) Any rules made in pursuance of this section shall be advertised twice in the official journal to be issued by the comptroller, and shall be laid before both Houses of Parliament as soon as practicable after they are made, and if either House of Parliament, within the next forty days after any rules have been so laid before that House, resolves that the rules or any of them ought to be annulled, the rules or those to which the resolution applies shall after the date of such resolution be of no effect, without prejudice to the validity of anything done in the meantime under the rules or to the making of any new rules.

87.—(1.) All things required or authorised under this Act to be done by, to, or before the Board of Trade, may be done by, to, or before the President or a secretary or an assistant secretary of the Board.

(2.) All documents purporting to be orders made by the Board of Trade, and to be sealed with the seal of the Board, or to be signed by a secretary or assistant secretary of the Board, or by any person authorised in that behalf by the President of the Board, shall be received in evidence, and shall be deemed to be such orders without further proof, unless the contrary is shown.

(3.) A certificate, signed by the President of the Board of Trade, that any order made or act done is the order or act of the Board, shall be conclusive evidence of the fact so certified.

88.—An Order in Council under this Act shall, from a date to be mentioned for the purpose in the Order, take effect as if it had been contained in this Act ; but may be revoked or varied by a subsequent Order.

(*To be continued.*)

THE LATE LORD KELVIN.

THE funeral of the late Lord Kelvin took place on Monday last, in Westminster Abbey, His Majesty the King was represented by the Duke of Argyll, and the Prince of Wales and Duke of Connaught also sent representatives. The pall bearers included Mr. John Morley, Admiral Seymour, Lord Tweedmouth (representing the Admiralty), Admiral Sir John Fisher (the Navy), Lord Courtney, the Lord Provosts of Glasgow and Edinburgh, Lord Rayleigh, Sir Archibald Geikie, Sir John Wolfe Barry, and others. Many of the important learned societies of Europe were also represented, including the French Academy of Science, the Accademia dei Lincei of Rome, the Elektrotechnischer Verein of Berlin, Austrian, French, Swiss and American Societies, and the Universities of Sydney and Montreal. The Royal Society's delegates included Sir William Crookes, Sir William White, and Sir Alexander Kennedy, and among the other societies represented were the Physical Society, the Astronomical Society, the Institution of Electrical Engineers, the Institute of Civil Engineers, the Institution of Naval Architects, the Royal Institution, the British Museum, the Imperial Institute, the Literary and Philosophical Society of Manchester, the Liverpool Engineering Society, the London Mathematical Society, the Royal Meteorological Society, and the Royal Institute of Public Health. The University of Glasgow was represented by the Principal (Dr. McAlister) and nine professors. Cambridge sent its Vice-Chancellor, the Master of Trinity, and the Master of Peterhouse (Lord Kelvin's old college). The Manchester University was represented by Professor Lamb, Professor Boyd Dawkins, Professor Rutherford and Professor Schuster ; while the Birmingham University was represented by Sir Oliver Lodge and Professor Poynting.

The body of the famous scientist is interred in close proximity to the burial place of Sir Isaac Newton.

INDUSTRIAL POISONS.

ON the 13th inst., Professor Oliver lectured at the Society of Arts, John-street, Adelphi, on "Industrial Poisons : Lead and Phosphorus."

In his introductory remarks, Professor Oliver mentioned that cases of lead poisoning were still too numerous to allay public apprehension on the subject, and it was only fitting that Great Britain should not be behind other countries in the matter of industrial hygiene. In Great Britain, lead miners were free from lead poisoning, although this was not the case abroad. The lead mining industry of this country was not so prosperous as formerly, it having been found more profitable to obtain the metal as a by-product in the production of silver. It was in the smelting of the mineral that the lead poisoning danger first arose. The lecturer described, by the aid of lantern slides, the process followed in mining and smelting lead, and then dealt with the manufacture of white lead. The workpeople employed in emptying the beds, and in drying and packing white lead were the chief sufferers, owing to the dust always associated with these operations. The lead entered the system by the alimentary canal, the respiratory passages, and the skin. Sex had a great bearing on lead poisoning, women being more susceptible than men. Loss of power in the wrist and extreme pallor were the chief symptoms. Alcohol was a predisposing cause, but Professor Oliver did not think that lead workers were any more intemperate than those of other industries. In the old days, when women were largely employed in such factories, blindness often overtook them within three months, and in the workhouses of to-day could be seen women who had lost their sight through lead poisoning. He pointed out, for the benefit of young medical practitioners and others, that what, in women, often appeared as hysteria, was in reality due to lead poisoning, followed by death in about 48 hours. Lead sometimes remained dormant in the system during lengthy periods—in one case for seventeen years, and eventually produced paralysis of the eye-ball. However, if workpeople would only carry out the regulations formulated by the Home Office as to personal cleanliness, there would be fewer cases of lead poisoning.

With regard to the match industry, better conditions had resulted in a decrease of phosphorus necrosis. In the old days, anywhere was considered good enough for the manufacture of matches, and a view was shown of an old-time works in which a workman could be seen dipping the matches in such a manner as to inhale the fumes emitted from the yellow phosphorus paste. Since that time great strides had been made in the match industry by the employment of labour-saving machinery, which obviated the handling of the matches, and he had hoped that in a few years there would seldom be a case of phosphorus necrosis. Dealing further with the subject of necrosis, the lecturer observed that some medical men held the opinion that it was tubercular, but he thought there was little doubt that the phosphorus fumes obtained access to the bone through decayed teeth, producing abcesses and then "phossy-jaw."

CHEMICALS IN POLAND.—According to the reports of the Polish Customs Houses the importation of German chemicals into the Kingdom of Poland continues to increase. For the past half year the importation of such goods has exceeded that of the corresponding period of 1906 by 18½%. This circumstance has had a by no means favourable influence on the Russian chemical industry, the development of which is in any case slow, especially in artificial manures. The increase in the importation of manures is accounted for by increased Customs facilities under the existing commercial treaty with Germany.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS *of publication are* RESERVED. *This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Process for Manufacturing Oxalates from the Corresponding Formates by Heating in a Space from which the Air has been Partially Exhausted. Elektrochemische Werk. G m. b. H., Bitterfeld, Germany. British Patent, 19 943 Date applied for under International Convention, October 13, 1906

Oxalates are produced from the corresponding formates by heating in a space from which the air has been partially exhausted, the reaction being caused to take place at a temperature of below 360°.

Improvements in and Relating to the Manufacture of Portland and like Cements. H. Kelway Bamber, Outram House, Lower Addiscombe-road, Croydon British Patent, 23,450. Oct. 22 1906

The first two claims of this specification are :—(1) Regulating the setting time of Portland and like cements by supplying water in the form of fine spray or drops to the cement in a tube-mill, or other suitable mill, while the mill is working, so as to thoroughly and evenly mix the cement and water together. (2) The process of regulating the setting time of Portland and like cements, consisting in supplying a known quantity of water in the form of fine spray or drops to a known quantity of cement while the latter is being ground in a tube-mill, or other suitable mill, so as to thoroughly and evenly mix the cement and water together.

Improvements in or relating to Apparatus for Producing Gas from Liquids. H. W. Hanwell, 96, Abingdon Street, Northampton, and E. A. Beard, 11, Burns Street, Northampton. British Patent, 24,965. Nov. 6, 1906.

This invention has particular reference to the production of gas from petrol, paraffin, or other carbonaceous liquids. A mixing device is provided whereby the liquid is mixed with the requisite quantity of air and then is drawn into a pump whence it is discharged to a reservoir or gasometer. It has before been proposed to use a pump to first draw in a charge of air and fuel and then to pass this mixture through a heater whence it could be drawn off for use in the cylinder of an explosion engine, but in apparatus constructed according to this invention, the mixture is compressed in the pump prior to its discharge to the reservoir, and no heater is employed. The pressure to which the gas is submitted in the pump, moreover, is considerably in excess of that obtaining in the reservoir, and this compression appears to have the effect of converting the mixture into a fixed gas without passing it through a heater. A suitable pressure is maintained upon the gasometer for the purpose of feeding the gas through the connecting conduits, whereby it is led to the burners for lighting or heating purposes, or, if it is desired to use the gas for generating motive power, it may be led to the cylinder of an internal combustion engine.

Device for Mixing Fluids of Different Densities or a Heavy Precipitate with a Liquid. H. Leiser, Alter Markt, Thorn, Western Prussia. British Patent, 25,108. November 7, 1906.

The inventor claims :—Arrangement for mixing fluids or molten metals of different densities, or a heavy precipitate, with a liquid, and consisting of a set of S-shaped tubes dipping into the heavier substances and pointing obliquely upwards, the lower flared ends of which tubes point towards the direction of rotation, and the planes laid through which tubes form an angle with the radial plane.

Improvements in Effecting the Removal of Arsenic from Liquids and Gases. G. W. Johnson, 47, Lincolns Inn Fields, London (communicated by Chem. Fab. Griesheim-Elektron, Frankfort-on-the-Maine, Germany). British Patent, 3 435. February 12, 1907.

The patentee states that further investigations regarding the removal of arsenic from liquids and gases in which the arsenic is present as arsenious chloride or fluoride (and especially from sulphuric acid, hydrochloric acid, fluorhydric acid and gases which contain sulphur dioxide) have shown the inventors that the benzene derivatives mentioned in Specification No. 974, 1907, can, with advantage, be replaced by derivatives of the

Digitized by Google

aliphatic hydrocarbons for effecting such removal of arsenic from liquids and gases, and the bodies deprived of arsenic be colourless. For removing arsenic from sulphuric acid, for instance, tetrachloride of carbon is most suitable.

The process can be carried out as follows:—Presuming that sulphuric acid of 66° B. containing 0.1% of arsenic is to be treated, it is mixed in a stirring vessel with six parts per thousand of hydrochloric acid of 24° B., or with the equivalent amount of fluorhydric acid. Ten per cent. of tetrachloride of carbon is then added and the whole is well stirred for a few minutes. The mixture is then allowed to become clear, and the tetrachloride of carbon, which now contains the arsenic, is removed. In order to regenerate the tetra-chloride of carbon which has become saturated with arsenic, it is treated with about double its quantity of water whereby the tetrachloride of carbon will be entirely deprived of its arsenic. The acid from which the arsenic has been removed is quite colourless.

In order to remove arsenic from gases, it is preferred to use acetylene tetrachloride on account of its high boiling-point. If the gases and solvent be allowed to pass through towers in opposite directions, perfect removal of the arsenic is effected. The acetylene tetrachloride can also be regenerated for reuse by removing the arsenic by washing with water.

Improvements in or Relating to a "Process for Absorbing, Condensing or Purifying Gases." F. Brandenburg, Lendersdorf, near Dueren, Rhineland. British Patent, 7,116. Mar. 25, 1907.

This invention relates to a process for absorbing, reacting upon, condensing or purifying gases, and refers to that class of apparatus in which the gases are introduced into, and respectively passed through, a ring of liquid kept in suspension by centrifugal force, in order to overcome any pressure against the rising gases or to reduce the pressure at least to a minimum.

The present process is based upon the principle that when water or a pulpy liquid is introduced into a rotating cylindrical or conical vessel closed at the bottom, the water or pulpy liquid will rise along the walls, whereas the bottom will become uncovered. During this action the liquid assumes the shape of a suspended and rotating ring. If in this rotating vessel a stationary (*i.e.*, an immovable) cylindrical vessel is inserted in such a manner that the walls of the rotating vessel are kept equidistant and at a suitable distance apart from those of the stationary vessel, the annular space thus formed between the walls of these vessels will be very soon filled up by the ring of liquid mentioned above. The ring of liquid, however, is no longer under the influence of the ordinary pressure due to a fixed column of liquid, because the whole ring of liquid is kept in suspension by centrifugal force. This condition of a suspended volume of liquid can be utilised to great advantage in order to bring gases, air and the like in a finely divided condition for a longer period of time into intimate contact with the liquid. To this end the inner vessel is provided with a bottom through which the gases are introduced into the rotating vessel. The gases thus introduced enter the rotating ring of liquid, take part in the rotation of the latter and ascend in said liquid, and each particle of gas describes a long spiral path, whereby two forces act upon each particle of gas, namely, the rotating volume of liquid, acting as a horizontal force, and the upwardly directed force of the gas based on the small specific weight of the latter, acting as a vertical force. The resultant of these two forces represents the actual path taken by each particle of gas, *i.e.*, the spiral. The drawing accompanying the specification shows an elevation of a device for putting the invention into practice.

An Improvement in the Manufacture of Soaps, Detergents, and Saponaceous Compounds generally. A. H. Charlton, Glenhurst, Brentford. British Patent, 16,448. July 17, 1907.

According to this invention a pure soap is made by the ordinary process with animal and vegetable fats and oils and rosin, and a solution of caustic soda, running away the "spent" and "half-spent" lyes and fitting the soap with an excess of alkali. The mixture is then allowed to settle to allow the impurities and nigre to drop, and the pure soap floats on the top; this is allowed to cool to a temperature at which the aftermentioned emulsion is not effected. The soap is transferred to a suitable pan fitted with a stirring apparatus, and to the soap is added an emulsified mixture composed of the following essential ingredients, and in about the following proportions, namely, talcum, 1 to 2%, sodium carbonate, 2%, potassium carbonate, 4%, and petrol or other spirit, 6%. Silicate of soda and sodium sulphate may be added in variable proportions.

Improvements in Filter-presses. R. Rossée 8, Schroderstrasse, Heidelberg, and Unionwerke A.-G. Fabriken für Brauerei-Einrichtungen vorm Heinrich Stockheim, vorm Otto Fromme, vorm. Heinrich Gehrke and Co., 150/162, Neckarauerstrasse Mannheim. British Patent, 9 225 April 22, 1907.

The inventor claims:—(1.) A filter-press element with a filtering cake or slab made of fibrous material inserted into the grid-frame, characterised in that a circularly extending chann l or groove is formed on the inside of the frame between this frame, the grid and the filtering cake, or slab supported thereon, into which channel or groove open the inlet or outlet or delivery passages and also the spaces between the bars of the grid. (2.) A filter-press element such as that claimed in Claim (1) characterised in that the bars of the grid are bent down at the ends towards the frame, in order to form the channel or groove.

Improved Process for Producing Compounds of Oxygen and Nitrogen. A. Neuburger, 4, Courbière Strasse, and Westdeutsche Thomasphosphatwerke G. m. b. H., 17, Karlsbad, both of Berlin. British Patent, 9 939. April 29, 1907.

The claims of this specification are:—(1.) Process for the production of compounds of oxygen and nitrogen, characterised by the feature that a suitable mixture of these gases, such as air, is first heated by means other than electric arcs to a temperature of at least 1,000° C., and then subjected to the influence of the electric arc. (2.) A modification of the process above set forth characterised by the feature that the air or other suitable mixture of oxygen and nitrogen is first heated by means other than electric arcs to a temperature of at least 1,000° C., and is then passed over a large number of electric flame arcs consecutively.

Great Cement Proprietary, Ltd.—The report for the year to September 30 states that there is an excess of expenditure over receipts in Western Australia of £538. The expenditure in London was £124., and the interest on loans £1,479. The directors have waived their claim to fees for the period. In the latter part of last year some further prospecting work was done on the Sugarloaf and Ormuz leases, but no satisfactory results were obtained. A tribute was also afterwards let, but abandoned early in the year. The abandonment of the company's mining leases became a necessity, and a machinery area and water right were applied for, which protects the company's machinery and all the important buildings, thus affording time either for the realisation of same or their transfer to some other property in exchange for an interest therein. Up to the present, however, no suitable opportunity has presented itself in this latter respect.

Copper Statistics.—Messrs. James Lewis and Son, in their mid-monthly report on copper, state that shipments of copper from the United States to Europe and China continue on a large scale, and the surplus stock held by producers must now be materially reduced. American production and imports are curtailed to the extent of fully 20,000 tons per month—or 50%—that of Montana being less than one-third of its normal output. In addition to the Greene mine in Mexico it is stated that the mines of the Guggenheim Company and of the American Smelting and Refining Company are now practically closed. The reduction in the boundary district of British Columbia represents about 1,000 tons per month. Exports since September 30 have been at the rate of over 33,500 tons per month. Allowing for a reduction in the home consumption of one-half—or 12,500 tons—the excess of production and imports shows a surplus for export of 7,500 tons. It would therefore appear that the surplus stocks have been undergoing reduction at the rate of about 26,000 tons per month. If this continues for another three or four months, and the financial position in the United States improves, followed by a revival in trade, an actual scarcity of copper seems then to be quite possible—if not probable. Consumption in England and France, and exports of manufactured copper from England continue good, and manufacturers have been very busy with orders freely booked at the low level to which prices have fallen since October 1. In Germany the exceptional activity in trade which prevailed earlier in the year shows signs of diminution. Last year the consumption of Europe and export of imported copper exceeded 1,000 tons per day.

SUPERPHOSPHATES IN RUSSIA.

THE consumption of chemical fertilisers tends to increase considerably in the regions of Riga and Libau, according to a recent report of the French Consul at Riga. The large agricultural syndicates founded by the German landowners; the "Consumverein" of Libau, which has a branch at Riga; and the "Jelbsthilfe" have been the means of extending the use of these products. In addition several small agricultural companies, formed some years ago and which are now contemplating amalgamation into one concern, have done much to teach the peasants the value of chemical fertilisers and to facilitate their purchase. The ports of Riga and Libau import chemical fertilisers not only for the neighbouring districts, but also for nearly half Russia, which country is, and will be for some time to come, dependent for this commodity on foreign sources. Figures quoted by the *Chamber of Commerce Journal* show that of the 1,264,000 quintals of chemical manures imported into Russia in 1906, 438,000 quintals were imported through Riga and 162,000 through Libau. In phosphatic manures Riga imported, in 1906, 67,000 quintals of natural phosphates from Algeria and Tunis, three-fifths of this quantity being imported directly and two-fifths through Germany and England; in addition, 98,000 quintals of superphosphate were imported as well as 209,000 quintals of Thomas slag. Through Libau 41,000 quintals of superphosphate and 90,500 quintals of slag were imported. The French Consul states, however, that he has reason to believe that there is some confusion in the Customs returns. According to the officially published statistics 55% of the superphosphate imported at Riga came from Germany, 36% from Holland, and 9% from England; whilst 73% of the Thomas slag came from England and 27% from Belgium. The chemical manure merchants and shipbrokers in Riga, however, agree in declaring that the largest quantity of superphosphate is imported from England, notably Hull, and the largest quantity of Thomas slag from Germany, particularly Stettin. Superphosphate is sold under the name of its country of origin, German, English, Dutch, and Belgian, the English being the most highly esteemed. Prices vary according to the percentage of phosphoric acid, which may be from 8 to 20%, the usual quality containing from 13 to 14%. The latter is sold at 3 roubles 30 (6s. 11d.) per sack of 98 kilos., with a rebate of 10 kopecks (2½d.) per sack for cash, 5 kopecks for payment within five weeks, but interest at 8% is charged when payment is delayed more than seven weeks. The Customs duties are 7½ kopecks per poud gross, other expenses on arrival 2 kopecks—that is, about 11½d. and 3d. per quintal. The trade in superphosphate is done chiefly through the agricultural companies referred to above. The firm of G. Schwartz and Co. sells English products exclusively, and the firm of Simon Kahn, Belgian and Dutch products. At St. Petersburg there is a large manufactory of superphosphate which does a good business at Riga. Near Riga, at Mühlgraben, the factory of Höflinger and Co. is producing more and more yearly. Nevertheless, the consumption grows to an equal extent, so that the quantity of the total imports of superphosphate and Thomas slag taken together has been maintained with little variation during the last five or six years.

MR. THOMAS BERRY, head of the firm of Messrs. William Berry, Limited, blacking and boot polish manufacturers, of Manchester and London, who died on August 31, left estate valued at £350,737. gross, with net personalty £168,139.

COPIAPO MINING CO.—The report for the year ended June 30 states that the sum of £2,558. was received from working the mines and estate, but the outgo amounted to £7,654., leaving a debit at profit and loss account of £5,096. During the first half of the twelve months under review (July to December, 1906) the Dulcinea Mine was worked under the old system of the late management—viz., by picking and sorting the ore. In that period the ore produced was disposed of to the smelting establishments in Chili and England. From January 1, 1907, sales of ore were suspended, and the work of clearing out the old workings, extending development, and effecting the various improvements necessary for an increased output was taken in hand. During these operations, up to June 30, 4,506 tons of ore, with an estimated copper average of 5%, were mined, and some promising ground opened up, which has enabled the manager to report an increase in the reserves of ore.

THE LONDON AND HULL SOAP WORKS, LTD.—Application was made last week by the Humber Coal Company for a compulsory winding-up order in the matter of the London and Hull Soap Works, Ltd. Mr. Percy Wheeler, on behalf of the petition, said a resolution was passed by the company in October last in favour of voluntary liquidation, and they appointed Mr. Ellis, their secretary, the liquidator. The company was formed with a capital of £38,974., of which £8,000. was paid for goodwill, £8,000. to satisfy a mortgage, the remander being issued in fully-paid shares. The petitioner alleged that the prospectus was false and misleading; that far too much had been paid for the property. The allegations of petitioner were controverted by Mr. Buckmaster, K.C., and his Lordship said this was not a case for a compulsory order.—His Lordship also refused the application for an order of supervision.

THE CHEMICAL SOCIETY.

At a recent meeting of the Chemical Society a paper by Mr. and Mrs. H. Brereton Baker was read, dealing with Gaseous Nitrogen Trioxide. The intention of the joint authors was to discover whether the dissociation of liquid nitrogen trioxide into nitrogen peroxide and nitric oxide, which happens when the liquid is permitted to evaporate in the ordinary way, also occurs in the case of absolutely water-free liquid. The gas was prepared from white arsenic and nitric acid, dried over phosphorous pentoxide, and eventually liquefied and sealed off in a series of small bulbs cleverly blown on a single length of capillary tubing. The pure liquid nitrogen trioxide so obtained is of a green colour at ordinary temperatures, but changes to "Oxford Blue" at about 30° C. It cannot be dissolved in water, but when brought into contact with the latter it gradually dissociates, forming nitrogen peroxide, which then dissolves. The perfectly dry gas obtained by the evaporation of the fluid indicates by its density that its composition is chiefly N_2O_3 molecules with a quantity of N_4O_6 molecules.

A paper on "The Atomic Weight of Tellurium," by Mr. Baker, in conjunction with Mr. Bennett, was also read. During Mr. Baker's research into the non-reactivity of perfectly dry materials, he found that tellurium, dried very carefully, still reacted with oxygen and the halogens, and as tellurium appears to be abnormally placed in the periodic table, it seemed quite feasible that the anomalies referred to in this and the previous paper might be due to the association of an undiscovered element with tellurium. Exhaustive and minute fractionations of a considerable quantity of tellurium compounds have been compiled during the researches, but up to the present no results have been attained proving that the atomic weight of the element tellurium is incorrect.

Mr. Godby read a paper on "The Isomerism of the Double Sulphites of Sodium and Potassium." The author demonstrated that salts in which the metal is joined directly to sulphur do not occur. Mr. Lattey contributed papers on (1) "The Vapour-pressures of Amines and their Mixtures with Water," and (2) "Liquid Triethylamine."

Wages in the Coal Trade.—Lord James, the independent chairman of the Conciliation Board for the coal trade in the federated districts of England and North Wales, has made an award under which miners' wages will be advanced by 5% from the first making-up day in the new year. This is the fourth advance of 5% during the last twelve months, and the maximum specified in the agreement under which the Board was formed last December, for three years, has now been reached. The South Wales miners are also receiving the maximum under their agreement. Scottish miners' wages have been advanced as much as 40% during the year, and they are now 87½%—as against 60% in England and Wales—above the standard of 1888.

The New Austrian Commercial Treaties.—Reporting on the effects of new commercial treaties in Austria, U. S. Consul-General W. A. Rubbe (Vienna) observes that the new commercial treaties with Germany, Russia, Italy, Switzerland, and Belgium, went into effect early in 1906 and have not caused any diminution in the export trade of Austria, though it had been anticipated that the higher schedules in certain classes of goods might mitigate against the expansion of foreign trade. Exports have shown a steady and satisfactory development, and the fear of loss of trade has been proved to be groundless. Export trade, too, has been conducted at higher prices in several instances. One encouraging development under the new Austrian tariff law, which went into effect in 1906, has been that many industries have expanded materially, which is ascribed to the general prosperity. An instance of this is that at least 200,000 additional cotton spindles are in use for the production of the finer sorts of cotton goods, and that several foreign firms have built branch factories in Austria. In the paper industry a marked increase in the cost of raw material took place, causing an average increase in the prices of the finished product of between 10 and 15%, but the demand for all grades of paper is so great that most of the paper mills are running to their full capacity and are unable to accept orders for delivery under three or four months. The production of raw sugar in Austria for the year 1906 was the greatest ever recorded. On account of the large production the price was extremely low, and the financial results were unfavourable, both in the raw and the refined product.

NEW YORK PRICES CURRENT.

Dec. 10, 1907.

Prepared for this Journal by Messrs. Stanley Jordan and Co., 100, William-street, New York.

The Salt Monopoly in Japan.—The British Embassy at Tokio reports that the working of the Japanese Government salt monopoly during the last two years has caused discontent amongst consumers owing to the high prices of the commodity, and disappointment to the authorities on account of the small revenue produced by the monopoly. The Government, therefore, has now arranged to sell direct to retail dealers, and the guild of wholesale merchants has pledged itself to uphold the measure.

Nigeria Bitumen Corporation.—Mr. J. S. Bergheim, presiding over a meeting of shareholders last week, said the total available cash balance on June 30 to test and work the properties was £40,000. He considered that the time had come when their partners, the Government, should come to the Company's assistance. The Company had spent a lot of money in the country. It was the duty of the Government now to begin exploring on their own account. The Company were quite willing to assist them. If oil was struck, the shareholders would make money, but it was nothing compared with what the British Government and nation would make. The amount could not be calculated; it would run into millions.

Market Reports.

THE RUSSIAN CHEMICAL MARKETS.

The St. Petersburg chemical report of December 14 states that prices for the most important items have undergone no change. Nitric acid, 36° Bé., is quoted 3 roubles to 3 roubles 20 copecks; borax crystals, 4r. 40c. to 4r. 80c.; chloride of lime, 1r. 45c. to

Digitized by Google

1r. 60c.; red potash, 30r.; sulphate of copper, 6r. 50c. to 6r. 60c.; salammoniac, 7r. 50c. to 7r. 60c.; potash (Saratoff), 2r. 75c. to 2r. 85c.; Chili saltpetre, 1r. 95c. to 2r.; ammonia soda, 1r. 35c. to 1r. 40c.; caustic soda, 2r. 65c.; muriatic acid, 55c. to 65c.; tartaric acid, 24r. 50c. to 25r. 50c.; superphosphate, 16-17%, 65c. to 70c.; lump sulphur, 1r. to 1r. 5c.; sulphuric acid, 66° Bé., 85c. to 95c.; bichromate of potash, 8r. 40c. to 8r. 60c.—all per pood of 36 lbs.

THE AMERICAN CHEMICAL MARKET.

(Rate of Exchange, $4.86\frac{3}{4} = £1.$)

NEW YORK, DECEMBER 10, 1907.

Nitrate of soda is quoted on spot at $2.32½., and shipments at $2.15. per 100 lbs. Sulphate of ammonia is steady but dull, at $3.05. per 100 lbs. Grey muriate, for galvanising, is 5½c. to 6c. per lb., according to make, and white electrical within about the same range. Lump carbonate of ammonia is 7¾c. to 8c. per lb., with powdered nominally 1c. per lb. higher. Lump sal ammoniac, good white seconds, is 9½c. per lb. Bleaching powders are dull at $1.20. to $1.30. per 100 lbs., as to make. Alkali is unchanged at 90c. per 100 lbs., f.o.r. makers' works, for light 58% in bags. Caustic soda, 74%, is $2.05. per 100 lbs., same conditions. Sulphate of copper, 5½c. to 5¾c. per lb. White powdered arsenic lower, at 5¾c. to 6c. per lb., with business very slack. Red Saxony arsenic is fairly firm, at 7⅜c. per lb. Carbonate of potash, calcined, 80-85%, 3¾c. per lb., and hydrated, 4½c. per lb. Caustic potash, 75%, 4¾c. per lb. Chlorates of potash and soda are unchanged under Syndicate control at 8¼c. and 8½c. per lb., respectively, f.o.r. makers' works. Bichromates are well maintained in value at 7½c. per lb. for soda, and 8⅝c. per lb. for potash. Prussiate of soda is somewhat firmer but dull, at 9½c. per lb., while potash remains at 5½c. per lb. Phosphate of soda is stronger at $2.05. per 100 lbs. Oxalic acid is very weak, and is quoted down to 6½c. per lb. Business in general is slow, and prices in almost all lines have a downward tendency.

TAR AND AMMONIA PRODUCTS.

TUESDAY.

Benzols: quotations given at 8½d. to 8¾d. for 90's, and 8¼d. to 8½d. for 50-90's, casks included. Crude tar, 13s. 6d. to 17s. 6d. per ton, Thames; 1½d. to 1⅝d. per gallon delivered. Refined tar, 12s. per barrel. Gas Company, 12s. 6d. Pitch, 22s. to 22s. 6d., f.o.b. Gas Company, 24s. 6d. East Coast, 20s. 6d. to 21s. West Coast, 20s. to 20s. 6d., f.a.s. Refined naphthalene, £6. 10s. to £8. 10s., packages included. Toluol, 90%, 9d. to 9½d.; pure, 1s. 1d., casks included. Carbolic acid, crude, 50% 1s. 4d. to 1s. 5d.; 60%, 1s. 7d. to 1s. 7½d.; Crystals, 29-40, 4¾d. to 5d.; 34-35, 4½d. to 4¾d. Cresylic, 95%, 1s. 0½d. to 1s. 1d. Anthracene, 40 to 45%A, 1½d. to 1¾d., casks incuded. Pyridin,, 3s. 3d. to 3s. 6d.

Sulphate of ammonia weak. Nearest values are:—Beckton, spot and forwar d £12. 2s. 6d. to £12. 5s.; Beckton terms £11. 13s. 9d. to £11. 15s.; London, £11. 13s. 9d. Hull, £11. 15s.; Liverpool, £11. 16s. 3d. to £11. 17s. 6d.; Manchester, £11. 13s. 9d. to £11. 15s.; Leith, £12.

Nitrate of soda, ordinary, 11s. 3d., and refined, 11s. 6d.; Liverpool, ordinary, 11s. 6d., and refined, 11s. 9d.

LONDON METAL MARKETS.

TUESDAY.

Copper: Standard brands, £60. 10s. to £60. 15s. cash, and £61. 15s. to £62. for three months. Tin: G.M. quality, £122. 15s. to £123. 5s. cash, and £124. to £124. 10s. three months; English, £125. to £126.; Banca, fl77½. Lead: Soft foreign, prompt, £14. 12s. 6d.; March, £15.; English, £15. Spelter: Ordinary brands, December, £19. 15s.; January, £19. 15s.; February, £19. 15s.; April, £19. 10s., ex ship; hard, £16. 10s., f.o.b. Antimony, £33. to £34.; crude, £19. 10s.; ore, £8. 10s. to £9. Bismuth, 6s. 6d. Quicksilver, £8. 5s.; seconds, £8. 3s. 9d. Nickel, 1s. 10d. per lb. Aluminium, £100. Wolfram, nominal, 25s. Pig-iron closing prices: Cleveland, 49s. 6d. one month; 48s. 10½d. three months.

FERTILISER MATERIALS.

TUESDAY.

The usual holiday feeling is now making itself manifest, and there is little business passing in any branch of the manure trade.

There is nothing new to report regarding mineral phosphates.

Nitrate of soda has advanced rather suddenly, and to-day's quotations, on spot, are 11s. 6d. per cwt. for ordinary 95% quality, and 11s. 7½d. for refined.

East Indian bone meal remains unchanged at £5. per ton, nett cash, c.i.f. Liverpool, for shipment; and at £5. 5s. to £5. 10s. per ton ex store here, on spot.

MISCELLANEOUS CHEMICAL MARKET.

TUESDAY.

As usual at this period of the year, the course of business is to some extent interrupted by the holidays, and the markets generally are inactive. Prices on the whole are steady, and any fluctuations during the week have been of unimportant character. In the alkali trade the quotations for all the principal products stand practically unchanged: Sulphate of copper is firm at £22. 5s., f.o.b., for early spring d livery; caustic soda, 70%, £10. 15s., f.o.b.; alkali, 58% (in bags), £4. 10s., f.o.r.; soda crystals (in bags), 57s. 6d. per ton; saltcake, in bulk, is in good request at 42s. 6d. per ton, carriage paid; sulphur, in bulk, £4. 17s. 6d. per ton, f.o.r.; bleaching powder is quiet, at £4. 7s. 6d., f.o.r. and f.o.b. Chlorates firm, at 3½d. per lb. There is good demand for potash, caustic and carbonate, at £24. and £19. 10s. respectively. Acetate of lime is steady, at £11. 10s. for 80%, c.i.f. Other acetates are unchanged. Acetic acids are selling freely. Prussiates of soda and potash are fairly active at 3½d. and 5¾d. per lb. White powdered arsenic is firm, at £26. to £27., according to brand. Ammonia and salts of ammonia are generally in good request.

LIVERPOOL OIL MARKET.

TUESDAY.

Palm oil brisker, with small sales of Saltpond, on spot and for December delivery, at £25. 5s., and Congo for early arrival at £25. 15s., and hard oils for December-January delivery at £26. per ton., all in transit. Linseed oil steady, with quotations given at 23s. 9d. to 24s. 6d. per cwt., for Liverpool makes in exports casks, according to quality. Cottonseed oil in fair demand at 23s. 9d. to 24s. 9d. for Liverpool refined in export barrels. Tallow quiet. Turpentine dull at 34s. per cwt. for spot parcels. Petroleum: A fair business is being transacted in refined oils, with values given at 7d. for Russian and Roumanian, and 7½d. to 8½d. per gallon for American refined oils. Petroleum spirit steady, at 1s. 0½d. to 1s. 3d. per gallon, according to grade, for American.

LIVERPOOL DRYSALTERIES.

TUESDAY.

Montreal potashes and pearl ash nominal, with nothing doing. Logwood steady, but in little demand. Fustic quiet. Cutch little inquired for, but values are maintained. Gums: Soudan arabic has a quiet market with the tendency against sellers, but holders of Niger remain steady. Gambier is experiencing only a quiet demand, but quotations are unchanged at 20s. 6d. to 21s. for block, *re* weights or store, 20s. for October-November shipment, 19s. 3d. for November-December shipment, 17s. 9d. for December-January, and 17s. 6d. for January-March shipment; with cubes offering from the quay at 28s. to 28s. 6d., in store at 28s. 6d. to 29s., October-November shipment at 28s., November-December at 27s. 3d., and December-January at 27s. per cwt. Castor oil is brisker, with quotations given as follows:—Good seconds, Calcutta, 3 5/16d. to 3⅜d.; store parcels, 3 5/16d.; first pressure Belgian, 3 7/16d.; first pressure French 3¾d., and 3¼d. for second pressure French. Shellac quiet, but steady in all positions, sales including fair TN orange, on spot, at 120s. to 122s. 6d. for fair, and for arrival January-March shipment 120s., c.i.f. Glucose steady: American liquid, 43%, on spot, 11s. 9d., and January-March delivery 11s. 3d., January-March shipment 9s., c.i.f.; Union Jack crystals, January-March delivery offered at 11s. 3d., ex works, London; chips, 80%, for shipment, 9s., and 70% 9s., c.i.f. American powdered starch on spot, 11s., and for shipment, 10s. 6d., c.i.f. Pearl, on spot, 10s. 9d., and for shipment, 10s., c.i.f. Cream of tartar, 98%, foreign powder, 8s.; 95%, 85s. Tartaric acid: English, on spot, 11¼d.; foreign, 11d. Citric acid, 1s. 8d.; foreign, 1s. 8d.

HULL PAINT, OIL, AND COLOUR REPORT.

Tuesday.

OILS.—During the week linseed oil has declined most having lost 15s. per ton. Refined cotton oil is steady. Turpentine is very weak, and has lost 25s. per ton. Rosin closes weak and in favour of buyers. Amongst the principal imports here to date, as against a year ago, are:—Wheat, 4,005,642 qrs., against 3,817,312 qrs.; flour, 208,631 cwt., against 345,910 cwts.; linseed, 794,897 qrs., against 574,450 qrs.; rapeseed, 103,199 qrs., against 127,988 qrs.; cottonseed, Egyptian, 194,485 tons, against 170,326 tons; other kinds, 152,927 tons, against 113,774 tons; oilcake, 26,748 tons, against 42,126 tons; hemp, 133,751 cwts., against 157,007 cwts.; olive oil, 3,881 tuns, against 3,632 tuns; tar, 14,909 barrels, against 13,691 barrels; linseed oil closes 20s. 10½d., naked, spot, 20s. 3d. January-April, 19s. 1½d. May-August, boiled and refined £1. to £1. 10s. per ton extra. Exports during the week have been:—5 tons Germany, 3 Norway, 5 Turkey; total, 13 tons. Refined cotton oil 20s. 7½d., spot, naked, 21s. 3d. January-April; crude oil is quoted 19s. 4½d., spot; casks £1., barrels £1. 10s. per ton extra. Exports during the week:—44 tons Belgium, 111 France, 45 Germany, 76 Holland, 17 Sweden, 21 Turkey; total, 314 tons. Rape oil, brown, 32s., naked, spot. Spirits of turpentine, 33s. 9d.; Russian ditto, 18s. 6d. Caster oil unchanged. Rosins from 9s., according to grade. Cod oil, £16. to £19. per ton.

CAKES.—Steady for all kinds. Linseed, 95% pure, £7. 15s. to £7. 17s. 6d.; Russian, £7. 12s. 6d.; Canadian, £7. 17s. 6d. Oilcakes (linseed), £6. 15s. Cotton cakes, best, £4. 17s. 6d.; Bombay, £4. 7s. 6d. Rape meal unchanged.

PAINTS.—Quiet with markets more in favour of manufacturers, which, however, comes too late to be of much value this year. Prices generally unchanged, and according to make and quality.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Tuesday.

The general market closes for the holidays (which are rather more protracted in Scotland than in England, encroaching more or less well into the first week of the new year) with a fairly steady feeling, so far as the maintenance of values is concerned, though with a gradually decreasing volume of transactions done and deliveries carried through. The tendency in sulphate of copper just before the close has been slightly to the mending side, with prompt price a shade better and rather more of inquiry for new year delivery, January to March. Values are about steady for the ordinary heavy lines of chemicals, but movement in deliveries has been getting smaller, as expected. In the section of mineral oils, solid paraffins and paraffin spirit (all of Scotch make), the year closes with a healthy tone all round, from the manufacturer's point of view, with recent values steady or tending upwards.

Chief prices current are:—Alum (in lump), £5. 5s. to £6. 5s., nett, ex quay, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 7s. 6d.; and 1-cwt. casks £6. 15s., nett, Liverpool; bichromate of potash (home-make), 3½d., less 2½% for Scotch and English deliveries (for export, 3¼d. nett, f.o.b. Glasgow); bichromate of soda (home-make), 3d., less 2½% for Scotch and English deliveries (for export, 2¾d. nett, f.o.b. Glasgow); bleaching powder, 35-37°, £4. 15s. to £5., nett, Tyne; borax, English refined, £16., and boracic acid, £25., nett, Glasgow; caustic soda, white, 76°, £11.; 70-72°, £10. 5s.; 60-62°, £9. 5s.; and cream, 60-62°, £9. 5s., all nett, Liverpool; chlorate of potash, 3¾d., nett, Glasgow; creosote (ordinary coal-tar and blast furnace), 2¾d. to 3d., naked, f.a.s. Glasgow; nitrate of soda 11s. 9d.; paraffin scale, hard, 2d. to 2¼d.; and soft, 2¾d. to 2½d. per lb.; paraffin wax, 120°, semi-refined, 3d. to 3½d.; paraffin spirit (naphtha), 10d. to 11d. per gallon; paraffin oil (burning), special quality, 7d.; ordinary sorts, 6¾d. and 6½d. (for new spot business), at Glasgow and other big centres; ditto (lubricating) 865°, £6. to £6. 5s.; 885°, £6. 15s. to £7.; 890-895°, £7. 10s. to £8.; prussiate of potash, 5¾d. to 6d., nett, f.a.s. Glasgow; salammoniac, first and second white, £42. and £40., less 2½% any port; saltcake, 42s. 6d.; soda ash, £5. 10s. to £5. 15s., nett, Tyne; soda crystals, £2. 17s. 6d. to £3.; sulphate of ammonia, £12. to £12. 1s. 3d. prompt, f.o.b. Leith; sulphate of copper, £22. 5s. to £22. 10s., less 5% Liverpool, prompt.

TYNE CHEMICAL REPORT.

Tuesday.

Chemicals continue in fairly steady demand, though shipments as usual at this period are showing signs of falling off. Caustic soda is steady at £10. 5s. for 70%, and £11. per ton for 76-77%. Bleaching powder is scarce and firm, at £5. to £5. 5s. per ton. Soda crystals locally quiet at £2. 17s. 6d. to £3. per ton, gross weights. Sulphur firm at £5. 5s. per ton.

Bleaching powder, softs, £5. 5s. per ton, nett; do., hards, £5. 10s. per ton, nett; caustic soda, 76-77%, £11. per ton, nett; do., 70%, £10. 5s. per ton, nett; recovered sulphur, 2 cwt. bags, £5. 5s. per ton, nett; alkali, 30%, £4. 17s. 6d. per ton, nett; do., 36%, £5. 2s. 6d. per ton, nett; do., 40%, £5. 7s. 6d. per ton, nett; hyposulphite of soda, 5/7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £3. 10s. per ton, nett; do., 100° Tw., £3. 17s. 6d. per ton, nett; do., 140° Tw., £4. 7s. 6d. per ton, nett; soda crystals, casks, £3. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £3. 2s. 6d. per ton, nett; sulphate of soda (saltcake), £2. 5s. per ton, nett; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £4. per ton, nett; blanc fixe, £6. per ton, nett; chloride of barium, refined crystals, £7. 10s. per ton, nett; do., crude calcined, £7. 5s. per ton, nett; sulphide of sodium crystals, £5. 15s. per ton, nett; do., refined concentrated solid, 60-62%, £8. per ton nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett; hydrate of barium, fused, 56-60%, £13. per ton, nett; do., crystals, 45-48%, £12. per ton, nett; strontium hydrate crystals, 90-95%, £8. 10s. per ton, nett; do., carbonate, 90-95%, £10. 15s. per ton, nett.

COALS.—The coal business of this district is now practically filled up for remainder of the year, and buyers seem now inclined to wait until after the turn of the year, as the impression is that prices generally are weakening. Quotations nominally to-day:—Best Northumbrian steam, 13s. to 13s. 6d. per ton; second qualities, 12s. 6d. to 12s. 9d. per ton; small coals, 8s. 9d to 9s. per ton; Northumberland unscreened, 10s. to 11s. per ton; best gas coals, 14s. 6d. to 15s. per ton; Durham bunkers, 12s. 3d. to 12s. 9d. per ton; household coals, 15s. 6d. to 16s. 6d. per ton; foundry coke, 19s.

New Companies.

Ameliorated Oil Co., Ltd.—Capital £50,000., in £1. shares. This company has been formed to carry on the business of oil and petrol producers, manufacturers, refiners and converters, manipulators of and wholesale and retail dealers in benzol, alcohol, spirits, gas, acids, chemicals, alkalis, unguents and ingredients, etc., and to enter into two agreements between R. Wynne and the B.W.P. Syndicate, Ltd. No initial public issue. The first directors are to be appointed by the subscribers; qualification 100 shares. Registered office, 10, Serjeants' Inn, Fleet-street, E.C.

Clements Lead Mines, Ltd.—Capital £150,000., in £1. shares. This company has been formed to acquire and turn to account mines and property. The first directors are not named; qualification, £250.; remuneration, £150. each per annum (chairman £200.). Registered office, 140, W. Regent-street, Glasgow.

W. Everitt, Ltd.—Capital £10,000., in £1. shares (2,500 deferred). This company has been formed to take over the business of an analyst and manufacturing chemist, carried on by W. Everitt at Norwood Wharf, Southall. No initial public issue. The first directors are W. Everitt (permanent managing director), E. Riley and A. C. Clandet; qualification, 100 shares. Registered office, 2, City-road, Finsbury Square, E.C.

Gare Syndicate, Ltd.—Capital £5,000., in 4,500 preferred shares of £1. each and 10,000 deferred shares of 1s. each. This company has been formed to acquire options for the purchase of patent rights and licences relating to rubber and rubber substitutes, and in particular to acquire a non-exclusive licence to work Gare's Reformed Rubber Process in the U. K., and certain options for the acquisition of the rights therein, and of Gare's Rubberite. No initial public issue. The subscribers are to appoint the first directors. Qualification (except first directors) 250 shares. Remuneration, £150. each per annum (chairman £200.). Registered office, 199, Piccadilly, W.

John Gibson and Co., Ltd.—Capital £4,000., in £1. shares (2,000 10% cumulative preference). This company has been formed to take over the business of a chemical manufacturer and merchant, drysalter and size, soap and glue manufacturer and merchant, carried on by J. Gibson at the Medlock Chemical

Digitized by Google

Works, Commercial-street, Manchester, as John Gibson and Co. No initial public issue. The subscribers are to appoint the first directors; qualification, £50; remuneration, £25. each per annum and 25% of the surplus net profits over £400. (after providing for depreciation and reserve), divisible. Registered office, 8, Commercial-street, Manchester.

Larne Salt and Alkali Co., Ltd.—Capital £8,000., in £1. shares. This company has been formed to acquire from J. Vint, of Carrickfergus, leasehold interests and mining rights under lands in the townlands of Redhall, Ballyedward, Drummadreagh and Aldfreck, all of Lower Belfast, to prepare for market salt, brine and other minerals, and to carry on the business of manufacturers of and dealers in soap, salt, alkali, etc. No initial public issue. The first directors are J. Vint, T. Vint, and others to be appointed by the subscribers. Qualification, 100 shares. Registered office, Roberttown Chemical Works, Liversedge.

Ore Dissolving Co., Ltd.—Capital £40,300., in 40,000 ordinary shares of £1. each and 6,000 deferred shares of 1s. each. This company has been formed to acquire any mines, mining rights, and metalliferous land in France or elsewhere, to adopt an agreement with D. Dubois, and to carry on the business of manipulators of and dealers in ores, metals and mineral substances, etc. No initial public issue. The subscribers are to appoint the first directors. Qualification, £250. Remuneration, £100. each per annum (chairman £150.) and 15% of the profits available for distribution in any year when 10% is paid on the ordinary shares, divided. Registered office, 56, Cannon-street, E.C.

Plumbago Trust, Ltd.—Capital £37,500., in 2s. 6d. shares. This company has been formed to adopt an agreement with the Inverall Diamond Fields, Ltd., and to carry on the business of financiers, holders of and dealers in stocks, shares and securities, etc. No initial public issue. The first directors are J. Burns, C. F. Leighton, J. Barker, W. R. Matthews, and T. H. Larkin, Qualification, one share. Remuneration, £100. per annum, divided. Registered office, Moorgate Station Chambers, Moorfields, E.C.

Standar ise l Disinfectants Co., Ltd.—Capital £1,000., in £1. shares. This company has been formed to acquire the manufacture of and trade in the disinfectants known as Sizolin and Pynoze, hitherto carried on with India by J. H. Pope, trading as Hop[illegible], Hartope and Co., of 22, Billiter-street, E.C., etc. No initial public issue. The first directors are not named; no qualification necessary. W. Grimsey is the first secretary. Registered office, 22, [illegible]-street, E.C.

Karachi, £73
Rosario, 160

Dextrine—
Italy, £60

Dyestuffs (*otherwise undescribed*)—
Calcutta, £54
Sweden, 87

Ferro Silicon—
U.S.A., 50 t.

Fish Oil—
Trieste, £7,549
Venice, 369
Italy, 1,016
Marseilles, 223
Rouen, 120
Hamburg, 8 c. 18 lb.

Gelatine—
Boston, £195
Montreal, 21

Glycerine—
B. Columbia, £425
Bombay, 60

Guano—
St. Kitts, 5 t.

Gutta Percha—
Amsterdam, 1 c. 3 q. 2 lb.

Hydrochloric Acid—
Trinidad, £124

Iodine—
Toronto, £224
Rotterdam, 1 t. 1

Lead Nitrate—
Belgium, 1 t. 1 c.

Lead Ore—
Karachi, 2 t.10 c.

Linseed Oil—
Christchurch, 1 t.
Dunedin, 5 12 c. 2 q.
Trieste, 4 1
Alexandria, 8 16 3
Cebu, 1
H. Kong, 1 18 2
Bombay, 1 3

Litharge—
Auckland, £83

Manure—
Jersey, 745 t. 9 c. 3 q.

Oxalic Acid—
Boston, £600

Paraffin (Solid)—
Bari, 16 t.16 c. 2 q.
Marseilles, 2 8

Paraffin Wax—
Bari, 1 t.12 c. 3 q.
Venice, 62 1
Helsingfors, 13 13 1
Italy, 25 9 1
Marseilles, 4 3
Paris, 9 1 3
Christiania, 15 17 2
Bombay, 14
Demerara, 17 2
Rouen, 5 2 3

Potassium Bichromate—
Timaru, 1 t. 3 c. 3 q.
Venice, 6 3
Rotterdam, 10 18 4
Bombay, 5 4 3
Rouen, 6 4 3
Amsterdam, 2 1

Red Lead—
Trieste, 3 t.15 c.
Rotterdam, 1 4 1 q.
Bombay, 14 10

Rosin—
Bombay, £28

Soap—
Switzerland, 6 t. 4 c.
Calcutta, 1 9 2 q.

Sodium Cyanide—
Auckland, £2,627
Fremantle, 408

Sodium Iodide—
Rotterdam, 1 t.

Sodium Bichromate—
Antwerp, 6 t. 2 c. 1 q.
Rouen, 5 19 3

Stearine—
Trieste, £1,073

Superphosphate—
Jersey, 210 t.

White Lead—
Karachi, 18 c. 2 q.
Westport, 2 t. 7
Alexandria, 1 19
B. Ayres, 2 10 3
Bombay, 4

Yellow Prussiate—
U.S.A., 17 t.18 c.

Zinc Oxide—
Auckland, 1 t. 8 c.

TYNE.

Week ending December 14.

Antimony—
Batoum, 2 t.

Antimony (Regulus)—
Rotterdam, 18 t. 12 c.

Barium Binoxide—
Genoa, 6 t. 4 c. 2 q. 14 lb.
Leghorn, 44 11 2 10

Barium Carbonate—
Rotterdam, 51t. 19 c. 2 q.

Bleaching Powder—
Gothenburg, 25 t. 3 q. 6 lb.
Bergen, 5 9 c. 1
Copenhagen, 17 19 2 8
Rotterdam, 14 16 2 14
Odense, 3 3 2 20

Caustic Soda—
Gothenburg, 4 t.18 c. 2 q. 18 lb.
Genoa, 55 6 1 10
Amsterdam, 6 9 2 16
Bergen, 2 18 4

Fish Oil—
Malta, 12 c.

Manure—
Copenhagen, 2 t.

Red Lead—
Gothenburg, 2 t.17 c. 1 q. 9 lb.
Batoum, 1 18 3 4
Piræus, 15 19
Copenhagen, 3 18 6
Rotterdam, 2 3 14
B. Blanca, 10 12

Satinite—
Copenhagen, 25 t. 2 c. 11 lb.

Soap—
Bergen, 2 t. 7 c. 23 lb.

Soda—
Stavanger, 10 t.

Soda Compounds—
Gothenburg, 10 t. 3 c. 14 lb.

Soda Crystals—
Venice, 5 t. 7 c. 2 q.

Sodium Sulphate—
Gothenburg,120 t.

Sulphur—
Gothenburg, 60 t.

White Lead—
Odessa, 4 t. 11 c. 10 lb.
Batoum, 2 1 27

Zinc White—
B. Blanca, 1 t. 2 c. 2 q.

GOOLE.

Week ending December 14.

Ammonium Carbonate—
Hamburg, 16 cks.
Rotterdam, 55

Chemicals (*otherwise undescribed*)
Copenhagen, 10 cks.
Ghent, 8
Hamburg, 6 15 crbys.
Rotterdam, 18 24cs. 41 dms.

Coal Products (*otherwise undes.*)—
Amsterdam, 50 cks.
Antwerp, 19
Boulogne, 71 1 dm.
Delfziel, 218
Hamburg, 49 18
Rotterdam, 48

Colours—
Antwerp, 6 cks.
Rotterdam, 7 1 cs.
Boulogne 3 21, 5 dms. / 12 tins.

Dyestuffs (*otherwise undescribed*)—
Rotterdam, 10 cks.2 cs.

GRIMSBY.

Week ending December 11.

Basic Slag—
Esbjorg, 200 bgs.

Caoutchouc—
Halmstad, 2 cs.

Chalk—
Rotterdam, 8 cks.

Chemicals (*otherwise undescribed*)
Antwerp, 1 ck.
Hamburg, 30 5 kgs.
Rotterdam, 9 / 25 brls.

Coal Products (*otherwise undes.*)—
Helsingborg, 5 brls.

Colours—
Hamburg 3 cs. / 4 brls.

Manure—
Hamburg, 801 bgs.

Soap—
Malmo, 2 cs.
Rotterdam, 50

PRICES CURRENT.

TUESDAY, December 24, 1907.

PREPARED BY MESSRS. HIGGINBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified. The price in different localities may vary.

		£	s.	d.
Acids :—				
* Acetic, 25% and 40%	per cwt.	8/9 & 12/9		
* ,, Glacial	,,	36/6		
Arsenic S.G. 2,000°	,,	30/-		
* Fluoric	per lb.	0	0	4½
* Muriatic (Tower Salts), 30° Tw.	per bottle	1/1		
* ,, (Cylinder), 30° Tw.	,,	0	2	0
* Nitric 80° Tw.	per ton	14	15	0
* Nitrous	nett per cwt.	0	18	6
Oxalic	per lb.	0	0	3¾
Phosphoric, 1750°	,,	0	0	10½
Picric	,,	0	0	10½
* Sulphuric (fuming 70%)	per ton	6	0	0
* ,, (Pyrites, 168°)	,,	3	2	6
* ,, (,, 150°)	,,	30/-		
* ,, (free from arsenic, 145°)	,,	36/-		
* Sulphurous (solution) S.G. 1025	,,	3	0	0
Tannic	per lb.	0	1	3
Tartaric	,,	0	0	10½
*Acetone	per ton	80	0	0
Arsenic, white powdered	nett ,,	26	0	0
*Alum, loose lump (delivered)	,,	5	12	6
Alumina Sulphate (pure)	,,	4	7	6
Aluminoferric (in slabs)	,,	2	12	6
Aluminium (Ingot metal 98/99%)	nett ,,	106	0	0
*Ammonia, Anhydrous	per lb.	0	1	1
* ,, .880	per ton	24	0	0
* ,, .920	,,	13	0	0
,, Carbonate	per lb	0	0	2½
,, Muriate (grey)	per ton	25	0	0
,, ,, (sal-ammoniac) 1st & 2nd	per cwt.	42/- & 40/-		
,, Nitrate	per ton	36	0	0
,, Phosphate	,,	38	0	0
,, Sulphate (grey), London	,,	11	13	9
,, ,, ,, Hull	,,	11	15	0
,, ,, ,, Manchester	,,	11	13	9
*Aniline Oil (pure)	per lb.	0	0	5½
Aniline Salt ,,	,,	0	0	4½
Antimony	per ton	34	0	0
,, (tartar emetic) 43/44%	per lb.	0	0	9½
,, (golden sulphide)	,,	0	1	3
Barium Chloride	per ton	7	5	0
,, Carbonate (native), 92/94%	,,	5	0	0
,, Sulphate (native levigated)	,,	45/- to 65/-		
*Bisulphide of Carbon	,,	18	10	0
Bleaching Powder, 35%	nett ,,	4	7	6
* ,, Liquor, 7%	,,	2	0	0
Chromium Acetate (powder)	per lb.	0	0	5½
Calcium Chloride	per ton	2	10	0
China Clay (at Runcorn), in bulk	,,	20/- to 27/6		
Coal Tar Products and Dyes :—				
Alizarine (artificial) 20%	nett per lb.	0	0	7
Magenta	,,	0	2	3
Anthracene, 40-45% A, f.o.b. L'don,	per unit, per cwt.	1½d. to 1¾		
Benzol, 90's	per gallon	0	0	8½
,, 50/90	,,	0	0	8½
Carbolic Acid (crude 60°)	,,	0	1	7½
,, (crystallised 40°)	per lb.	0	0	5
,, (liquid 95/97%)	per gallon	0	1	1
* Creosote (ordinary), naked	,,	0	0	2¾
* ,, (filtered for Lucigen light)	,,	0	0	3½
* Crude Naphtha, 30% A @ 120° C.	,,	0	0	3½
* Grease Oils, 18° Tw. (naked)	per ton	2	15	0
* Pitch, f.o.b. Liverpool or Garston	,,	1	1	0
* Solvent Naphtha, 90% @ 160°	per gallon	0	1	3
Copper	per ton	60	15	0
,, Sulphate	,,	22	5	0
,, Oxide (copper scales)	,,	55	0	0
*Glycerine (crude), 80%	,,	37	10	0
* ,, (distilled S.G. 1260°)	,,	61	10	0
Iodine	nett per oz.	0	0	6
*Iron Sulphate (copperas)	per ton	1	12	6
,, Sulphide	,,	3	10	0
Lead (sheet)	,,	16	15	0
,, Litharge Flake (ex ship)	,,	17	15	0
,, Acetate (white) ,,	,,	28	10	0
,, ,, (brown) ,,	,,	25	0	0
,, **Carbonate (white lead), pure**	,,	21	10	0
,, **Nitrate**	,,	32	0	0
Lime, Acetate (brown) (ex ship)	per ton	7	15	0
,, ,, (grey) 80%	,,	11	10	0
Magnesium (ribbon and wire)	per lb.	1	0	0
,, Chloride	per ton	3	7	6
,, Carbonate	per cwt.	1	17	6
,, Calcined Magnesia	per ton	19	0	0
,, Sulphate (Epsom Salts)	,,	3	0	0 *
Manganese, Sulphate,	,,	17	10	0
,, Borate	per cwt.	2	2	6
,, Ore, 70%	per ton	6	5	0
Methylated Spirit, 64° (Industrial)	per gallon	0	1	8 *
Naphtha (Wood), Solvent	,,	0	2	4 *
,, ,, Miscible, 60° O.P.	,,	0	1	11 *
Oils :—				
Cottonseed	per ton	22	0	0
Linseed	,,	22	5	0
Stearine	,,	32	0	0
Phosphorus (yellow)	per lb.	0	1	5
,, (red)	,,	0	1	11
Potassium, Bichromate	nett ,,	0	0	3½
,, Carbonate, 90% (ex ship)	per ton	19	10	0
,, Chlorate	per lb.	0	0	3½
,, Cyanide, 98%	,,	0	0	8½
,, Hydrate (Caustic Potash), 90%	per ton	25	0	0
,, ,, ,, 75/80%	,,	21	0	0
,, Potash Hydrate Liquid, 50%	,,	14	0	0 *
,, Nitrate (refined)	,,	23	10	0
,, Permanganate (small crystals)	per cwt.	36/-		
,, Prussiate (yellow)	per lb.	0	0	5¾
,, Sulphate, 90% (ex ship)	per ton	9	15	0
,, Muriate, 80% ,,	,,	9	0	0
Silver (metal)	per oz.	0	2	0½
Sodium (metal)	per lb.	0	3	0
,, Carb. (refined Soda-ash), 48%,	nett per ton f.o.r w'ks.	5	15	0
,, ,, (Caustic Soda-ash), 48%	,, ,,	5	10	0
,, ,, (Carb. Soda-ash), 48%	,, ,,	5	10	0
,, ,, (Alkali), 58% (bags)	,, ,,	4	10	0
,, ,, (Soda Crystals) (bags)	,, ,,	2	17	0
,, Acetate (ex ship)	,, ,,	17	5	0
,, Arseniate, 45%	,, ,,	22	0	0
,, Borate (Borax), Crystals	,, ,,	16	0	0
,, Bichromate	,, per lb.	0	0	3
,, Cyanide (100% basis)	,, ,,	0	0	7½
,, Chlorate	,, ,,	0	0	3½
,, Hydrate (76% C. Soda) (f.o.b.)	nett per ton 10 ton lots	11	0	0
,, ,, (74% C. Soda)	,, ,, ,,	10	15	0
,, ,, (70% C. Soda)	,, ,, ,,	10	5	0
,, ,, (60% C. Soda)	,, ,, ,,	9	5	0
,, ,, (pure liq. 90° Tw.)	,, ,, ,,	4	15	0
,, 77/78% powdered (99% hydrate)	per ton	12	10	0
,, Bicarbonate (cwt. kegs)	,,	6	15	0
,, Hyposulphite	,,	6	5	0
,, Manganate, 25%	,,	20	0	0 *
,, Nitrate (95%), ex ship, Liverpool	per cwt.	0	11	6
,, Nitrite, 98%	per ton	29	10	0
,, Phosphate	,,	9	5	0
,, Prussiate	per lb.	0	0	3½
,, Silicate (glass)	per ton	5	7	6
,, ,, (liquid, 100° Tw.)	,,	3	15	0
,, Stannate, 40%	per lb.	0	0	9
,, Sulphate (Salt-cake)	per ton	2	2	6 *
,, ,, (Glauber's Salts)	,,	1	12	6 *
,, Sulphide (crystals)	,,	6	5	0
,, Sulphite	,,	6	5	0
Strontium Hydrate, 100%	,,	9	0	0
Sulphocyanide, Ammonium, 95%	per lb.	0	0	6½
,, Barium, 95%	,,	0	0	3½
,, Potassium	,,	0	0	7
Sulphur (Flowers)	per ton	6	10	0
,, (Roll Brimstone)	,,	6	5	0
,, Brimstone (Best Thirds) (ex ship)	,,	4	12	6 *
Superphosphate of Lime (26%)	,,	2	10	0
Tallow	,,	32	10	0
Tin Crystals	per lb.	0	0	9½
,, English Ingots	per ton	127	10	0
Zinc (Spelter)	,,	19	10	0
,, **Chloride (solution, 100° Tw.)**	,,	5	15	0 *
,, Sulphate, Crystal	,,	6	15	0

Reactions, Production of, by Electricity. *Moscicki* 81
Reactions, Producing, by the Electric Arc. *Naville, Guye and Guye* 269
Reaction Towers and Regenerative Chambers. *R. Scherfenberg* 221
Saturators for Sulphate of Ammonia Manufacture. *Williams and Fenner* 426
Soap Manufacture. *Charlton* 590
Soap Manufacture. *Henderson* 127
Soap Manufacture. *Thompson* 308
Soap Manufacture. *Samuel and Lockwood* 585
Soap, Super-alkalinated Dry. *Societe Francaise "la Cremoudine."* 200
Sulphide Ores containing Zinc, Treatment of. *McIvor and Fradd* 287
Sulphuretted Hydrogen. *Tyers, Hedley and the United Alkali Co., Ltd.* 127
Sulphur, Extraction of. *Rohleder* 200
Sulphur from Gangue. *Gunther and Franke* 200
Sulphuric Acid, Concentration Apparatus for. *Boult.* 246
Sulphuric Acid, Lead Chambers for Manufacture of. *Fromont* 451
Sulphuric Acid, Purification of. *Raschen, Wareing, Shores & United Alkali Co., Ltd.* 33
Superphosphate Pits, Discharging Apparatus for. *Neech* 127
Tanning Extracts. *Stewart.* 542
Tartaric Acid. *McDougall & McDougall* 518
Tin, Electrolytically Refining. *Steiner.* 287
Tin, Extracting from Iron-containing Tin Products. *Brandenburg* 308
Tin, Extraction of, from Ore. *MacIvor & Fradd* 199
Tin, Extracting from Ore. *MacIvor & Fradd* 498
Vapours, Recovery of, from Volatile Liquids. *Diamanti* 287
Water-Gas Producers. *Clark* 157
Water, Waste, Purifying. *Girerd and Drapier* 565
